The Metal Worker

A WEEKLY JOURNAL OF THE ROOFING, CORNICE, STOVE, TIN, PLUMBING AND HEATING TRADES.

With which is Incorporated The Stove and Tin Trade Journal, the Sheet Metal Builder and Metal.

VOL. XL. NUMBER 7. | NEW YORK AND CHICAGO, AUGUST 12, 1893. | ONE DOLLAR A YEAR SINGLE COPIES, 5 CENTS.

NATIONAL.

AMERICAN RADIATORS

(TRADE-MARK.)

Acknowledged

Superior

To all other makes.

Best Construction. Largest Assortment.

STANDARD RADIATORS

STANDARD RADIATOR CO. BUFFALO. N. Y.

SOLD EXCLUSIVELY BY

AMERICAN RADIATOR COMPANY

AMERICAN RADIATOR COMPANY

111 & 113 Lake Street, CHICAGO, ILL.

New York.	Minneapolis.	Boston.	Denver.	St. Paul.
92 Centre St.	330 First St., North.	44 Oliver St.	1810 Blake St.	114 Endicott Bldg.

Factories: DETROIT AND BUFFALO.

BONNELL'S NUBIAN

The best grate enamel on earth for anything you want to paint black. $2.00 per doz. In gallon cans for dealers' use.

ENGLISH BLACK ENAMEL,

Next best, $1.50 per doz. Our patent brush with each can of both NUBIAN and ENGLISH and a show stand in every case.

The Nubian Iron Enamel Co.,

8 to 10 BONNELL PLACE, CRAGIN, ILL,

77 Warren St., New York.

Hall & Carpenter, Phila., Pa. Taylor Goodrich, San Francisco, Cal.

Brown, McClure & Wales, Boston,

AND ALL JOBBERS EVERYWHERE.

E. S. WHEELER & CO., New Haven, Conn.

ISSUE AN ELABORATE CATALOGUE OF

Tinners' Supplies, Plumbers' Supplies,

WHICH WILL BE SENT ON REQUEST.

THE BEST ENGINEER

always endeavors to buy the best machinery; that is the reason so many thousand engineers write the Mason Regulator Co. for catalogues.

"The Metal Worker" for 1893.

It is proper, on the occasion of the change of form of *The Metal Worker*, to review very briefly the contents of this number and hint of certain improvements in management and new features that will be adopted during the coming year. The Trade Review which *The Metal Worker* has presented for the past two years is continued, and we take this occasion to thank our readers for the very generous response they have made to our circular letters and for the information they have supplied. We appreciate the confidence that has been bestowed upon us in the many cases where information of a private nature has been furnished, and this trust, we hardly need add, will be faithfully respected. The summaries of these reports are printed in the various departments and present a review of the trade in the chief divisions in which the readers of *The Metal Worker* are concerned. In addition to this account of business for the preceding twelvemonth we publish a regular number of *The Metal Worker*.

Among other things in this issue we would call attention to a competition in skylight construction, announced on another page. We believe that it will call forth a great many competitive plans. In the same department we commence a series of articles on a Country Cornice Shop, which will deal with the question of cornice making in a way to attract the beginner. The primary instructions given about pattern cutting for cornice work will interest all sheet-metal workers, and the account of home-made tools will be of particular value to tinsmiths and others in country districts who have occasion to do a little cornice work.

The Stove Trade department is given up largely to reviews of the trade, including a special article about the situation in the West. There is also the beginning of a serial on changed conditions in the Eastern stove trade, prepared by one who is thoroughly conversant with the history of the industry. We have in view for this department, furthermore, articles written by a foundry manager on practical stove making, covering the various stages of the work.

In steam and hot water heating and plumbing and gas fitting, we shall present many instructive articles for the benefit of the journeymen, and which will also, we trust, interest the employers as well. A part of the review in this week's *Metal Worker* entitled "The Business of 1892 in Steam and Hot-Water Heating Apparatus," is furnished by a member of the trade who is thoroughly conversant with the conditions as seen from the standpoint of a manufacturer. A series of articles on hot-blast heating will be begun, and in the Plumbing division of the paper we shall introduce a series of competitions of a sort that will be particularly interesting to the younger members of the trade.

The Letter Box and Correspondence department of *The Metal Worker* will receive more careful attention hereafter, and it is our wish to interest all our readers and persuade them to write us on topics about which they may seek information. We have practical experts connected with the paper ready to answer all ordinary questions and to make search for information that is not at hand.

Pattern cutting and sheet metal work generally will continue a prominent feature, and we take pleasure in announcing that *The Metal Worker* now has more contributors among practical men engaged in furnishing articles for this department than ever before.

The hardware division of *The Metal Worker* will be given ample space and receive careful treatment, while the Trade Report and Price Current will continue to furnish a reliable and valuable guide to buyers.

The serial on tin-plate manufacture will be completed, and besides such technical articles we will print information about the American industry, including descriptions of works and new machinery. We will also present an interesting account of the different brands and grades of plates that are being made in the United States.

Concerning the present form of *The Metal Worker*, it is not necessary for us to speak. We believe that it will commend itself to all, and that the advantages of greater compactness and convenience in handling will appeal to every reader of the journal. In conclusion, we wish to return a very cordial New Year's Greeting to the host of friends who have wished us prosperity for the coming year.

How to Get Ahead.

The investigator who cut open the bellows to see where the air came from, has been credited with an unwise curiosity; yet it is possible to learn a lesson from his example, although our zeal for information may not lead to like destructive consequences. The boy who takes his toy to pieces to see what makes it go, is more likely to improve its construction or invent a new one than he who is content to be simply amused; and as the boy is father to the man, he will, at maturity, continue to search after the How? and Why? "Inquire within" is written for him on all mechanical matters with which he may be connected, and instruction of the eyes, the ears or the hands is always welcome. The Yankee character has long been expressed by an interrogation mark, and his inquisitive disposition made a subject of ridicule. Yet this trait has a bright side in that it is usually accompanied by the putting his acquired information to practical use, primarily for himself, but also benefiting others. Those who call him a regular "Paul Pry" also recognize his constructive ability, which fact is illustrated by an old story. Once upon a time a traveler in the Southern States was, though a stranger, hospitably entertained there according to their usual custom, and when the host learned that his guest was from Connecticut he exclaimed, "I'm powerful glad you stopped here for my clock is right smart out o' order."

Investigate and Invent.

This duet of investigation and invention, which often are in accord, is not now confined to New England people, and the poet's line "He makes the thing and the machine that makes it" will apply to others than the Yankee Boy. There is a pleasure and a promise in observing the spread of an observant disposition among craftsmen, especially the younger class, instances of which have been noted in these columns. It has been said that the man who makes two blades of grass grow where but one grew before is a public benefactor, and so likewise is he who by study and experiment increases mechanical production. We expect that the young man who enters a trade school or becomes an apprentice does so from purely selfish motives, or, as we say, to get an honest living; also, if he, by a persistent searching after the possibilities of his calling, discovers a better way, it is for personal advantage, and he feels a corresponding proprietorship which may make him object to a competitor whose superficial knowledge may carry him along until a crucial test shows his deficiency. In such a case there should be a survival of the fittest, but the right of a man to

claim a monopoly simply because, after passing through an apprenticeship or trade school, he is self-labeled an expert at any particular craft may be questioned. There is no royal road to success in mechanics, but the persistent search after the best way referred to above will usually get there, and a continuance of the same may lead to a broad knowledge covering more than one trade, making it possible for a good tinner to be also a good plumber.

An Old Fashioned Winter.

The distribution of cold this season is more general than it has been in many previous years, and the usual effect of seasonable weather upon many lines of trade is manifest. The favorable influence is felt in all kinds of winter sporting goods. Skates, which have had a very meager use in the vicinity of New York for several seasons, are this year likely to have a chance to add much zest to the sports that winter inaugurates. A cold winter always has a favorable influence upon the heating business for the ensuing season. It discovers weaknesses in apparatus not hitherto known and whose realization will lead to the substitution of more powerful apparatus or to increase of the capacity of that already employed. Many a building that in preceding milder seasons has not had opportunity to test its full requirements for comfortable heating in protracted severe weather, has been found by this visitation of cold sadly deficient. Somebody will, next summer or fall, get the job of overhauling the heating plant and supplying the needed alterations and additions. An instance of this has just come to our knowledge—a new church that last year was sufficiently warmed by its heating apparatus (four large warm-air furnaces) without serious difficulty, but which on Christmas day of this year could not be comfortably warmed by driving the furnaces to their utmost and adding to their heating power all that could be added by lighting in the daytime every gas jet, high and low, in the building. Numerous failures of this kind will be developed before the cold winter we have entered upon will make way for milder climatic conditions. Such extreme weather also makes itself felt upon the plumbing in all large and small towns and cities. Pipes will freeze and burst, some of them through neglect of servants and house owners, others because they have been placed in positions too much exposed to frost, and care enough has not been taken to protect them. All this will make immediate work for plumbers. It has been observed that when cold weather comes early enough to make large quantities of ice and to freeze the ground deeply before the sun begins its return northward, cold climatic condition in these latitudes are apt to be protracted well into early spring. If this observation be accurate we are likely this year to experience an old fashioned winter, with all this implies to the various callings that supply the wants cold weather creates, including the manufacture of overcoats and of cough remedies.

Protection to Merchants.

The question as to the character of the protection the dealer has a right to expect from the manufacturer whose goods he handles is one which is often coming up. The trade have frequently reason to complain that after placing orders with manufacturers their customers are canvassed by the manufacturers and the sale of goods seriously interfered with. It is to be regretted that there are indications of a disposition on the part of manufacturers to visit consumers, and in cases where they would probably be well looked after by the local trade. Many of our readers are familiar with the annoyance and loss thus occasioned. Precisely what is to be expected in this regard is a question about which there would be some difference of opinion, and it is obvious that it would depend upon the special circumstances in each case. This matter has been suggested by the letter printed below, which is from a well known house in a Western city:

We would like to have your opinion in a matter of controversy now going on between a manufacturer in Cincinnati and ourselves. We are about 60 miles from that city and are carrying their goods on our shelves. They furnish us printed matter with which we can canvass the trade here and in surrounding towns. They recently quoted a shop in a town 11 miles from us, and we objected to it, claiming that they ought to refer the parties to us. In their reply they say, "We aim to protect the jobber in every way whenever we quote prices or sell to the smaller trade." We claim that this is in no sense a protection to the jobber and they disagree with us.

In submitting this question to our readers we would state that the discount quoted to the shop was 67½ per cent. and the discount at which the goods were purchased by the house, 70 per cent. We shall be glad to have an expression of opinion from manufacturers or merchants as to whether under these circumstances the protection given the dealer was sufficient.

A Two Years' Fair.

As usual, the question of preserving the World's Fair buildings at Chicago as one of the attractions of the city is now coming up for discussion. There has probably never been a great exposition with its special buildings of enormous extent and more or less pretension to architectural beauty that has not suggested this idea to the persons interested. It does seem a heartless and woeful waste of money to lavish millions on structures only intended for a season's occupancy. The Chicago buildings being confessedly superior in size and adornment to anything of their kind, the regret of the Chicago people that they should be doomed to destruction next winter is perfectly natural. Suggestions are now being made that while many of the buildings can and should be removed some of the largest and finest ought to be preserved. A few of the latter have even gone so far as to advocate a World's Fair for two successive years instead of confining it to six months of 1893. The experience of all cities that have attempted to maintain so-called permanent expositions is unfavorable to such a scheme. The great attractiveness of a World's Fair arises from the fact that a host of exhibitors are stimulated to put forth their very best efforts at a particular time. This requires somewhat elaborate preparation, much thought and considerable expense. Exhibitors would not do this two years in succession. There would be no freshness to the second year's display, and with this known the attendance would be light, and financial failure would result. The glory of the first year's achievement would be sadly eclipsed by the inglorious ending of the second season.

The Danger of Cholera.

There is no single question upon which the voice of the business community should be heard with greater emphasis than that of guarding against an invasion of cholera this year. We venture to say that no subject is being given so much thought as the possible effect of such a visitation upon our business. Yet, it is a curious fact that it is very rarely referred to in print. Every forecast made privately by business men, be it sanguine or otherwise, is coupled with the one reservation, "provided we keep free from cholera."

Under ordinary circumstances the influence of a panic of fear on the commercial interests of this country would be serious enough, but this year it would be particularly disastrous because it would cause a failure of the Chicago exposition. If cholera reappears this spring, the vexatious delays due to the necessary quarantine measures will greatly cut down the number of foreigners who would visit this country. In itself this would not be a very serious matter, because after all the foreign visitors will be a factor of minor importance.

But if it should happen that deaths from the plague took place beyond the Alleghenies Mountains, or if there should only be a single case in Chicago proper or in its vicinity, the attendance at the fair would drop off at an alarming rate and the undertaking would be a flat failure. It is quite useless to blink at the fact that the whole country would seriously suffer with the interests of those most directly stricken.

The whole matter is altogether too serious to be waved aside as an effort to borrow trouble. It will not do to attempt to silence discussion. It is in the thoughts of every conservative business man now. It is important that the public should be thoroughly aroused to the danger and that the business interests of the country make their power felt.

They do not want to have enormous losses inflicted because there is bickering over an exercise of authority. They will not allow professional jealousies to imperil the well-being of a whole nation. Vigorous and enlightened measures which will reassure the most timid must be adopted. This is no time for dallying. The danger should be faced squarely. It is not a matter which those who are not living on the seaboard can afford to placidly neglect. The central West has a very conspicuous interest in it. Pressure should be put upon the authorities to make every possible preparation to meet a possible visitation. When it comes from business men individually or through our great commercial bodies, resistance to it is out of the question.

PLUMBING AND GAS FITTING.

Plumbing.

A VERY general demand, on the part of the public, for a better class of plumbing work is a feature of this trade which has been noted by letters and reports received from correspondents in, or connected with, the plumbing business. Better education in sanitary matters is abroad; and people nowadays will not be satisfied with the rough and ready methods which were good enough for their progenitors, who got through their lives in blissful ignorance of the better sanitation of the present day. We believe that the plumber himself is more than ever alive to the value of thorough education in his craft, and appreciates the vital importance which attaches to the thoughtful and thorough performance of his work. So much depends upon the efficient manner in which the plumbing work is done in our homes that the matter comes, perhaps, more closely to each individual householder than any other social or economic question. Health, which means happiness and prosperity, hangs largely upon the sweetness of our domestic sanitary atmosphere; and for this we depend, in greatest measure, upon the intelligence and conscientiousness of the plumber who has carried out the work there.

We are glad to know that much is being done to aid the beginner in this trade by means of trade schools and other agencies of instruction, which give him a thorough groundwork of learning in his occupation. But more opportunities are still wanted for the education of the working plumber in the higher branches of his craft. We look for the day when every large city will hold out such opportunities as will come within the reach of every artisan, but more especially of those engaged in the plumbing trade.

IMPROVEMENTS IN WORK DONE.

We rejoice to hear from the reports of our correspondents this season that a marked improvement in the work done by plumbers has been observed during the year gone by. More brains and time have been put into it. And it has been found that this conscientious work has paid. Customers of average intelligence (and they are still the vast majority of the citizens of this country, fortunately) soon get to know and appreciate honest and efficient work, particularly in the plumbing line, and, sharp competition notwithstanding, will always employ the artisan of whose ability and integrity they are aware in preference to another whose prices may be more attractive, but with whose qualifications they are not acquainted. If the plumbing trade would more generally recognize this fact we feel sure we should have less complaint of obligation to cut prices to secure work, small profits and dull business.

Business, according to the general testimony of our correspondents in the plumbing trade, has been good during the past year. An average of about 10 per cent. more in its volume would, we believe, fairly represent the increase experienced. But this has been largely discounted by the low rates of remuneration received for work, although there has been a growing tendency noticed to adopt a better basis of prices in this respect.

NATIONAL ASSOCIATION.

The National Association of Master Plumbers have done good work in bringing the members of the trade more together and thereby promoting a spirit of harmony and good understanding, resulting in the furtherance of their mutual interests. A mitigation in reckless keenness of competition in some quarters is attributed directly to the influence of the association. The acceptance of contracts on imprudent terms is still noticed in some sections of the country. This cutting of prices naturally involves poor material and cutting of time and care in carrying out the contract, with the result of inferior and unsatisfactory work. We are not surprised to learn of the dropping out, during the year, of several concerns who were leaders in the "skinning" business.

OUTLOOK FOR 1893.

Building operations, which have been very active in most parts of the continent, have entailed good trade for plumbers, especially in the country. The good prospects of work in the building trade which are held out for 1893 are expected to insure a satisfactory volume of business for the plumbing trade, so that a prosperous year is hoped for, with, possibly, rather better prices. These, at any rate, are being agitated for in many districts, and we learn that the tendency is toward a better understanding in this respect.

Plumbers' Supplies.

In no one branch of industry, perhaps, has more material advance been made within the past five years than in the manufacture of sanitary fixtures and plumbers' supplies. Every year recently has seen marked improvements in methods and devices, as well as better workmanship and material put into the manufacture of these appliances, and of kindred lines connected with the plumbers' craft. The year just closed has been no exception to its immediate predecessors in this respect. We hear from the largest manufacturers of plumbers' supplies and specialties, in every part of the country, of new lines of goods put on the market during last year; of improvements on old methods, and the introduction of numerous devices tending to render more efficient the appliances used in the past. Manufacturers have been very active in their endeavors to attain perfection in this respect; and such strides have been made that, with the general level of efficiency and excellence which has been reached in these goods nowadays, it seems hard to believe that many improvements of a radical character are awaiting the trade in the immediate future.

What may be termed the artistic side of the manufacture of sanitary specialties and household conveniences, however, presents a wide field for variety in the design and decoration of such goods. This feature has received much attention this year, as the new catalogues of manufacturers which have reached us recently abundantly testify. Improvement in form and design of goods is apparent on nearly every page of these documents.

PROSPECTS FOR SANITARY GOODS.

Competition has been stronger than ever, and although the volume of sales made in 1892 generally overtopped those of previous years by a material increase, the margins of profit were so close as to leave, in some cases, less net gain than was the case with smaller business in former years. There has been some weeding out of rash and inexperienced concerns, while those most actively engaged in the business are devoting themselves to the problem of how to combine improvement in quality of goods with economy in cost of manufacture. A good deal of cheap stuff has been put out in novelties, in many cases whose sole merit is in their cheapness, and this has operated somewhat unfavorably upon the success of good and legitimate productions in the market.

A good volume of business in supplies is looked for during the present year; but little hope is held out for any general improvement in prices. As selling expenses increase annually, a very large augmentation will be necessary in sales to insure the pecuniary returns of former years. This is, however, a feature not peculiar to the branch of trade now under review. It is almost universal at the present time.

In Chicago great impetus has been given to the plumbing trade generally by the active building operations going on in that city in preparation for the World's Fair. This activity is expected to continue during the first half of this year. Meanwhile competition is almost lost sight of, there being ample business to go round the entire trade.

From Eastern makers of plumbing goods we hear that collections are poorer than they have been for years, and the demand for longer credit has been an important factor in 1892 business.

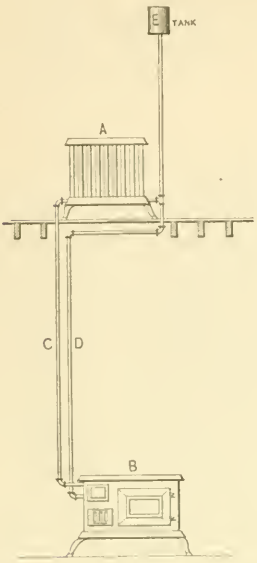
From Canadian sources we learn that manufacturers of plumbing and sanitary goods in that country have passed through a satisfactory season, and that the outlook for 1893 promises steady increase and fairly remunerative prices.

Heating Radiator from Water Back.

From G. R. W. *East Walpole, Mass.*—Please answer through your columns if the following is a practical scheme for hot water heating for a small room. Is it correctly arranged? In the drawing A is the hot-water radiator in room above; B kitchen stove with water back; C the feed or flow pipe to the radiator; D the return pipe to stove and E tank in the attic.

Answer.—We reproduce our correspondent's sketch in Fig. 1. The arrangement as shown will circulate the water through radiator on floor above and heat a small room, as desired. It is, however, preferable to connect the expansion pipe and air pipe to the flow pipe, as shown in Fig. 2. Our correspondent does not say if the hot-water reservoir H, Fig. 2, is to be left connected. If the radiator only is to be attached to the back, as shown in Fig. 1, the relative size of the back to the radiator and the radiator to the room to be

heated should be considered. Should the room be small and require little heat the radiator is liable to become excessively



Heating Radiator from Water Back.—Fig. 1.—Plan Proposed by "G. R. W."

hot and trouble may result through the production of steam in the back. As arranged in Fig. 1, the temperature of the radiator can only be controlled by the condition of the fire. The use of a valve on the radiator to impede circulation might result in blowing the water out of back and system through overflow pipe. If the reservoir H, Fig. 2, is used and its cold-water supply is from a source having a greater head or pressure than that due to the hight of the expansion tank, this tank and pipe connection from F, Fig. 2, will be removed. The tee at F will be replaced by an elbow. The flow and return connections from back to reservoir H are shown by dotted lines. A valve may be placed at G, Fig. 2. By partially closing this valve the flow of heat to the radiator is controlled, and may be stopped; in which case circulation goes on through the reservoir H. When this valve is open the greater part of the heated water from the back will pass to the radiator, because it it at a higher point in relation to the back then the reservoir H, and is in what may be termed a more favorable location.

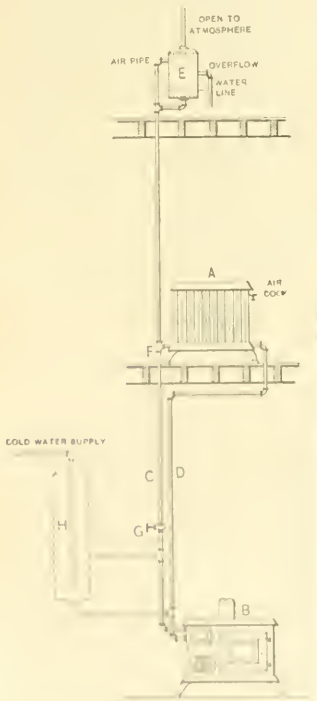


Fig. 2.—Sketch Showing Air and Expansion Pipe Connections

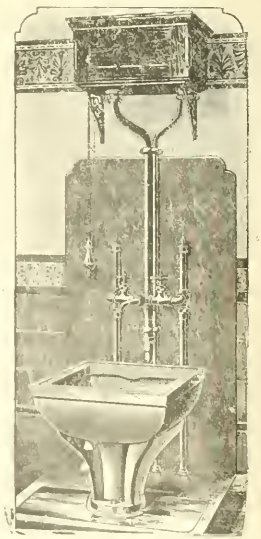
Without knowing all the circumstances and conditions connected with such cases, it is not possible to answer definitely the question as to whether such arrangements of pipes are correct or otherwise. Our correspondent will therefore accept our conditional reply to his query. We shall, however, be pleased to refer to the subject again when more data are supplied. Designs of such arrangements of piping between backs in ranges or stoves have appeared in some past issues of *The Metal Worker*, and there are several arrangements in use somewhat similar to the ones illustrated.

Old Dominion Mfg. Company.

In the fall of 1890 Clarence H. Rose, dealer in plumbers' supplies, 242 Water street, New York, made a trip through the Shenandoah Valley with a view to selecting a site suitable for the erection of a plant for the manufacture of plumbers' cabinet ware, including water closet seats, tanks, bathtub rims, laundry tub frames and covers. This prospecting tour resulted in the organization and incorporation of the Old Dominion Mfg. Company, capitalized at $125,000, of which $100,000, Mr. Rose says, has been paid in. A new town has since sprung up at this point called Sheudun, which is in the western part of Virginia, on the Shenandoah Valley branch of the Norfolk & Western Railroad, distant about 14 miles from Staunton. This region is well stocked with hardwoods, among them a variety of oaks, ash, cherry, cedar, walnut, poplar, pine and sycamore. Mr. Rose holds a controlling interest in the company, which has reserved for its purposes two full city blocks and two smaller ones, aggregating about 8 acres. On one of the blocks has been erected the buildings as mentioned below, viz.: a brick building 200 x 60 feet on the first floor and 70 x 60 feet on the second. A power house 43 x 25 feet equipped with an 85 horse-power boiler and 60 horse power engine; a dry kiln and steam house 90 x 17 feet, together with a new dry kiln recently added, 100 x 25 feet, the latter having a capacity of 40,000 feet of lumber, yielding about 4000 feet a day. There is also a brass and iron foundry building 200 x 40 feet. On a separate block is a finishing building 140 x 50 feet, having two stories. On still another block are the sheds, varnish and oil houses, the two latter, as a precautionary measure, being placed at a safe distance from the main buildings. The total floor space is nearly 50,000 square feet. Protection from fire is afforded in the wood-working departments by means of an automatic sprinkler equipment supplied from a tank 70 feet high, with a capacity of 16,000 gallons of water. A hydraulic ram forces water from the river near by at the rate of 4000 gallons a day, supplementing the supply afforded by wells dug on the property. In the new dry kiln is a 65 horse power boiler. The lumber supply is largely drawn from the adjacent forests, gangs of men employed by the company selecting and marking the trees while standing, which are subsequently cut and drawn to the mill as wanted. In July, 1891, but nine men were at work. Now the wood-working department has 75 men employed, while the brass and iron foundry, where are made all the metal fittings, valves, &c., used in the tanks, has a force of 25 men. There is a hand car railroad connection with the different departments, constructed on the gravity principle, for the quick and economical handling of lumber and materials, the idea being to so arrange the different stages of manufacture that progress is always made toward the finishing building without retrogading and getting in the way of work following. The finishing building is located alongside the railroad, where cars may be side tracked, the company's facilities being equal to the loading of a car in two and a half hours. The office and salesroom in New York are located at 242 Water street, in charge of C. H. Rose, where may be found a line of samples showing excellent workmanship.

Earthen Slop Hopper.

Peck Bros. & Co., New Haven, Conn., and 47 Cliff street, New York, manufacturers of fine sanitary appliances for water, gas and steam, are introducing an improved all earthen slop hopper, with double supply cock and flushing tank, as here illustrated. The company emphasize the desirability and great convenience of such a fixture, provided, as it is, with a long tube double cock, which will enable servants to thoroughly cleanse the slop receptacle, having at their disposal both hot and cold water. There is a reservoir or tank above, as shown in the illustration, con-

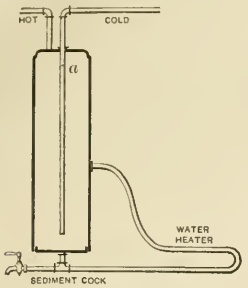


Earthen Slop Receptacle, Flushing Rim, Double Cock and Tank.

nected with a flushing rim in the hopper, which insures a complete flooding by merely pulling the chain.

How to Set a Boiler.

From YOUNG MECHANIC.—I am a subscriber for *The Metal Worker*, and have got a great deal of information from the questions asked by other mechanics and the answers that you have given. I would



How to Set a Boiler.—Fig. 1.—First Method of Connecting Range Boiler.

like to still further draw on your storehouse of information by asking which of the two inclosed sketches is the more correct way of setting a boiler for heating water for domestic use? Fig. 1 is my method and Fig. 2 is my friend's method. The reason my friend set his as per sketch Fig. 2, is because the boiler stands which come with our boilers are 12 inches lower than the fire boxes of the ordinary stoves used in our part of the country. I used to do the same thing until I got to reading *The Metal Worker*, and from its pages I learned that I was a little wrong, and I also noticed that with my boilers set as per Fig. 2 the lead pipe would sometimes burst at the point marked B. I then began to make neat wooden boxes, high enough to raise the top of my stand on a level with the

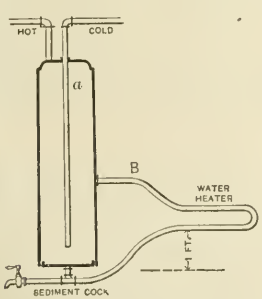


Fig. 2.—Second Method of Connecting Range Boiler.

bottom of the water back, bringing the bottom of the water back and the bottom of the boiler on a level. I find that I have no more trouble with bursted lead pipe, but my friend still says it makes no material difference. Please answer this question as soon as you can for the benefit of myself and other workmen.

Answer.—The sketch, Fig. 1, is the true way to set the boiler. The boiler must stand high enough above the cold-water inlet to the water back so as not to form a trap in the hot water circulation. In Fig. 2 the upward flow of the cold water from the bottom of the boiler to the water back is in contravention of the natural law that cold water descends and hot water ascends. A varying pressure in the supply of cold water results and this irregularity affects the flow of hot water from the water back to the boiler, which in time tests the strength of the lead pipe and may cause it to give way as our correspondent has described. The flow of cold water to the water back in sketch, Fig. 1, being natural, there is no such irregularity in pressure and consequently no strain on the pipe. The stands to which illusion is made are not of the right kind. There are boiler stands of the proper hight to bring the boiler up to the level of the water back or a little above it, in order to insure perfect circulation.

Education of the Plumber.

Henry A. Desper of Worcester, Mass., sends us some forcible remarks on the necessity of a better training for the working plumber, and urging the desirability of legislation to prevent incompetent workmen from exercising this important branch of trade to the hurt of the community at large.

Our correspondent begins his remarks by urging us to advocate the passage of laws requiring plumbers to pass examinations and obtain certificates of competency before being allowed to practice their trade. "Let the certificates," says he, "be first, second, third and fourth class, thus showing the ability of the holder, and have examinations held yearly so as to give aspirants an opportunity to advance their class. This method would stimulate the workman's ambition to perfect himself so as to attain the highest class, and consequently to secure the best wages. The standard of excellence could be advanced from year to year, thus leading the way to the best work possible."

The writer then proceeds to give a few reasons why plumbers should be examined before being allowed to do work:

"We do not trust our lives to incompetent engineers on steamboats (they being required by law to obtain licenses). Why should we then trust to incompetent plumbers?

"It is a crime to put poison in food. Why should it not be a crime for a plumber to put in work which fills a house with sewer gas and thus endangers the lives of the occupants?

"An old maxim says: 'Ignorance of the law excuses no one.' Why should ignorance on the part of the plumber excuse him when through his work he has introduced diphtheria and other kindred diseases into a man's house, and death has removed some of the best loved ones of the family? Does the plumber's excuse of 'I did the best I knew how,' make good the loss or give consolation for the vacant chair occasioned by the defective work performed by him?

"It is time we took hold of these things in a way that should be felt by all who have any such risks at stake.

"We are not talking now about the 'skin' plumber, who knows better but does not practice it; the one whose soul or conscience is so small that it would have as much play room in a tobacco seed as a mosquito would in a 40-foot barn. For such there should be laws passed that would place him behind the bars as securely as you would a murderer or like villain.

"Another class that should be dealt with as accessory to the 'skin' plumber is the parsimonious landlord, who cares not a whit for the lives of his tenants so long as he can keep them just alive enough to pay their rent.

"The lawyer is not allowed to practice until he is examined and admitted to the bar, which implies that he is qualified to practice.

"A physician is supposed to have a diploma before practicing medicine. Pilots, sea captains and ship masters are not picked up on the street anywhere and intrusted with the lives of others in a haphazard kind of way. Why not, then, elevate the standard of the plumber, and hold him responsible for his acts, or put him in such a place that you may know what you are intrusting your lives to? There is much more that can be said on this, but abler pens than mine are better qualified to deal with the subject."

TRAPS AND VENTS.

THE SHUSTER FOUNDRY COMPANY, Philadelphia, Pa., distribute an illustrated circular of Shuster's Sure Seal specialties. The publication, of oblong shape, is bound in cardboard with a front title of four interlocked capital S's, the initials of the goods described. The pages of the circular give illustrations, general and sectional, of a variety of the specialties, including square T clean-outs, sanitary T clean-outs, Y clean-outs, rain water leaders of different forms, combination traps, fresh-air inlets, soil pipe plugs, &c. Accompanying the illustrations are price lists of the various sizes and styles. In an introductory note attention is directed to the Shuster Foundry Company's pipe, the advantages of which are briefly described.

THE MOSELY FOLDING BATH TUB COMPANY, 181 South Canal street, Chicago, have issued a catalogue describing the different styles of folding tubs now made by them and also calling attention to the improvements made in their water heaters. The company refer to the fact that they have had two years of marked success in placing their goods in the hands of the public, that their sales extend from Maine to California, as well as to foreign countries, and that they now show a full line of 18 different styles. A great many reasons are given for the introduction of this class of bathtub to the trade, all of which are cogent and well directed. Folding tubs seem to be specially well adapted to small bathrooms, or to houses in which bathrooms have not been built, or to summer cottages located where running water and other conveniences cannot be had. The heater is so arranged that it can be used with the tub or for heating water separately if desired. Heaters are made for use with gasoline or gas. Folding tubs are made without heaters for use in small bathrooms in cities. In short, all requirements of this special line of trade seem to be met by the company, who have aimed to make their specialty as complete as possible.

WE HAVE RECEIVED from Kirtley Bros., sanitary and contracting engineers, Kansas City, Mo., a circular descriptive of Neff's patent system of water works operated by compressed air. The system is very clearly described and illustrated by a sectional view of a house supplied with water by this means, showing the method of operation. The compressed air system is recommended as a simple and economical means of water supply to homes, hotels, schools or public buildings, either in town or county, being easily adaptable for use with water drawn from a well, cistern, spring or lake. The compressed air necessary to force the liquid to a hight of 60 to 80 feet is pumped, together with the water, into an underground steel tank. The pressure of the air drives the water with great force through pipes, supplying

house and yard fixtures, 5 pounds pressure on the tank delivering water in the second floor. The water, according to the circular, never freezes in the winter, nor does it stagnate in summer; but an unfailing supply of pure, cool liquid is always insured. The circular concludes with a number of testimonials received by Messrs. Kirtley from users of the system in the Western States.

STANDARD FIBER-WARE COMPANY, Mankato, Minn., are distributing dainty little colored circulars, advertising the flax fiber ware household utensils made by the firm. The cards each bear on their face the portrait of some famous navigator, together with a picture illustrating the scene of his discoveries. On the reverse side attention is called to fiber chamber ware, which is recommended for its various merits—in being non-breakable, easy to clean and not subject to rust, while it is stated to be so thoroughly japanned inside as to resist the action of acids or alkalies. Illustrations of different articles made in this ware—such as dairy pails, wash basins, pitchers, cuspidors, slop jars, &c.—fill up the card.

Labor and the World's Fair.

A perfect tempest has been raised in labor circles by the World's Fair authorities in Chicago. It is claimed that the printing of the official catalogue of the exposition was awarded to the W. B. Conkey Company of that city without the formality of asking bids for the privilege and that this company have been conspicuously opposed to typographical unions. Representatives of trades unions have vigorously protested against the award and threaten all sorts of direful things if it is not withdrawn. The unions go so far as to proclaim a boycott on the fair and everything connected with it, if the demands of "organized labor" for the annulment of the award are not forthwith conceded by the exposition authorities.

The claim is made by the latter that the terms upon which the publication of the catalogue are to be undertaken by the company are more favorable for the World's Fair treasury than could possibly be obtained from any other printing house of the high business standing of the W. B. Conkey Company. The further claim is made that but 2 per cent. of the entire cost of the catalogue will be incurred in the wages to be paid compositors to be engaged on it and that therefore the row over the award is unreasonable. The unions, however, are fighting it as a matter of principle, on account of the stand against them which has been taken by the publishing company in the past.

Even if this trouble between the unions and the exposition management is amicably adjusted, it will be very remarkable if some other grievance against the fair is not sprung before it opens which will array organized labor against the enterprise. From its inception the labor agitators have endeavored to make capital for themselves among their followers on the slightest pretext. They have interfered with all sorts of arrangements and meddled with all kinds of contracts, persistently attributing to the managers the willful ignoring of the regulations of organized labor. They have been respectfully treated and their demands have been complied with to the extent of interfering seriously at times with the rapid progress of the work of construction. But they are insatiable. They must have control of everything. If their "rights" are abridged in the least degree they at once threaten a boycott. The award of the catalogue contract privately to the W. B. Conkey Company may not be defensible as a business transaction, but the outcry over it from the unions that it is a direct attack on them is childish and ridiculous. They are pushing the claims of "organized labor" too far, and have already aroused public sentiment against their attempt to monopolize employment under World's Fair contracts for their own membership. It is time that the reasonable element among the unions haul up their ridiculous "leaders."

The Johnson Steam-Pump Governor.

It is claimed by T. M. Johnson of New London, Conn., the manufacturer of the governor illustrated, that it is as positive in its action as a steam engine governor. The speed of the pump is controlled by the work being done indicated by the water pressure, and is uniform at all boiler pressures. It is further claimed that the governor is durable and not liable to get out of order, as there are no springs or diaphragms.

The body *a* of the valve is connected to the steam pipe from the boiler at *b*, with the throttle or starting valve between it and the casing. The body is also connected to the steam chest of the pump by a pipe connection at *c*. The weight on the end of the lever is adjusted to equalize the friction of the moving parts so that if the lever and water piston *k* are raised their full stroke the weight will be just sufficient to return the parts to their lowest point.

The slot in standard *g* is of such length that when the lever is at either end of its movement the steam valve *d* will be entirely closed, thus cutting off steam from the boiler to the pump at either position, as will be referred to later on.

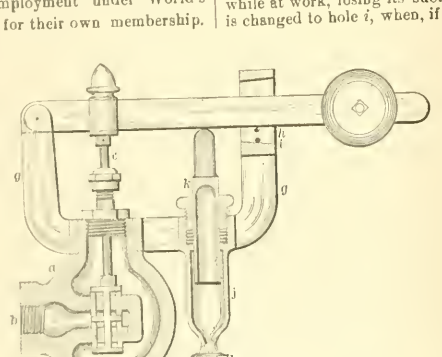
By inserting a pin in the hole *i*, the lever resting on it will hold the steam valve *d* in a central position or full opening, as shown in the cut, so as to admit a full head of steam to the pump.

The standard *g* swivels on the head of the casing, thus allowing for adjustment to suit the pipe connections.

The pipe *n* is connected to the water discharge pipe as near the pump as possible, and through the tee *m* to the water-pressure cylinder *j*.

The overflow pipe *p*, and overflow valve *o*, are connected by the pipe *q* to the suction near the pump.

In order to start the pump the valve *o* is opened and a pin is inserted in the hole *h* with the lever resting on it. The throttle valve is then opened. When the pump has started the valve *o* is closed to such a point as will permit a pressure of water in the cylinder *j* sufficient to raise the piston *k* and lever, thereby admitting enough steam through the valve *d* to run the pump. If there is danger of the pump, while at work, losing its suction, the pin is changed to hole *i*, when, if the pressure below the piston *k* is lost through failure of the water supply, the lever will drop to the pin, thus nearly closing the valve *d* and allowing only sufficient steam to pass to the pump to keep it moving. If the pin is not inserted in the hole *i*, then upon failure of the pump to draw the lever will drop to the bottom of its slot, closing the steam valve and stopping the pump.



THE JOHNSON STEAM-PUMP GOVERNOR.

Europe competes sharply with the United States for South American trade by constantly improving steamship communication. Line after line has been added, until to-day there are five direct and competing European lines to the West Coast of South and Central America and more than 30 to the East Coast. The United States has but six to the East Coast, five of which are owned and operated by English companies and sail under the English flag, while on the West Coast we are wholly unrepresented.

The year just drawing to a close has been one of great prosperity to the grain trade of Philadelphia. The exports of corn were 19,005,971 bushels against 2,201,264 bushels in 1891, and of wheat 10,001,172 against 6,733,663 bushels last year.

The Master Builders' Exchange of Philadelphia have resolved to recommend to the national organization a method of arbitration that shall be universally applicable and which shall fully recognize the rights of both employers and workmen.

WORLD'S FAIR NOTES.

Will the Fair be Ready in Time?

As much discussion has recently taken place over the probability of preparations for the fair not being completed in time, the following extract from an article, which appeared on the 31st ult. over the signature of Director-General Davis is significant:

"Will the exposition be ready in time?" is the question of the hour. Hundreds of thousands of people have visited Jackson park and returned to their homes amazed at the extent and magnificence of the buildings prepared for the reception of exhibits. To such as may have visited the exposition grounds a year ago, when the greatest of the buildings, that devoted to manufactures and liberal arts, was yet but a chaos of construction material, but one answer to such a query will suggest itself. Others who have only seen the completed buildings, and to whom the vastness of unoccupied floors has presented an appalling vista of work yet to be done, may have entertained misgivings as to the possibility of completion before May 1. Others again there will be who have not had an opportunity for personal observation, but who will recall the opening days of previous international expositions, and will predict therefrom a state of unreadiness next May. I think, however, I may be justified in saying that every one, whatever his personal misgivings may be, will join in the universal expression of goodwill toward the exposition, and desire at least that our most sanguine hopes may be fulfilled and that everything will be in readiness when the President of the United States shall declare the opening of the exposition a matter of history.

Work That Is Yet to Be Done.

To answer the question which now forms such an absorbing topic of discussion I should say frankly that there does not appear any reasonable ground for apprehension as to the completeness of all preparation in the time yet at our disposal. The loyalty and earnestness of every branch of the magnificent organization which has accomplished such marvelous results in the last 18 months will be found equal to the task yet before it, be the strain however great. Whatever human energy can accomplish will be done so far as it rests with the exposition to do and act.

Within the next four weeks every building on the grounds will be the scene of the greatest activity. The task of marking off aisles and avenues on the great floors is already under way. Allotments of space, which have so far been specified only in draftsmen's plans, will be speedily transferred to the floors of the various buildings. Thereafter the work of erecting inclosures and cases for the reception of exhibits will be pushed forward with all possible celerity. Already plans for handling the tremendous traffic are matured. Miles of freight cars will be emptied of their precious burdens with the regularity of a well-appointed railroad. The machinery for installation is well in hand, and inspires every confidence in this branch of the service. Upon the preparation of the catalogue, a work which has never yet been completed at the opening of a great exposition, one department is already engaged with the best assurance of success. In brief, whatever remains for the exposition management to do in the way of providing for the opening will be done.

The Exposition Management Ready.

Thus far the answer to the question, "Will the exposition be ready by the opening day?" must be an emphatic affirmative. There is, however, another phase of the question which must be considered, and upon which our predictions cannot be based with so much certainty. Up to the present the work of preparation has been absolutely under the immediate direction of the exposition management. Whether in the difficult task of negotiating with exhibitors or in the physical labor of erecting the buildings the authority of the exposition has been absolute and final. Wherever, for any cause, the work has dragged, extra assistance has been forthcoming. Careful supervision to the minutest detail has led to stupendous results, astonishing even to those under whose charge the work has been accomplished. But now comes a new element in the calculations for the future. The exposition management may do everything in its power, but its power is henceforth restricted according to the promptitude of exhibitors in fulfilling their share of the task of preparation.

Space in the Electrical Department.

Assistant Chief Hornsby of the Department of Electricity has completed the allotment of the greater portion of the space in the Electricity Building. In doing so he has not only been in advance with the work, but has accorded to France 22,790 square feet on the main floor and England 19,382 square feet on the main floor and galleries. France will occupy the entire northwestern bay. Germany's exhibit will take up 13,384 square feet on the ground floor, east of the French exhibit, and 5998 feet in the gallery. England will secure 7330 square feet in the western part of the building, and, with Canada, occupy 5998 feet in the galleries.

Thomas A. Edison, the wizard of Menlo Park, has been allotted 4,471 square feet just north from the center of the building. Mr. Edison will have probably the most attractive space outside of that embraced under the central dome of the building.

The south end of the ground floor has been allotted to large electric firms of the country. They include, among others, the Bell Telephone Company, the Detroit Electric Works and the Brush and Westinghouse concerns.

In the galleries will be installed the phonographs and scientific instruments and specialties. Here will also be shown the exhibits of the insulation and wire people and small displays of foreign countries.

Painted with Hose.

One of the great novelties in construction work on the Exposition grounds is the paint machine of which there are in the Manufactures Building alone ten in active operation. Thomas Turner of New York is the inventor of the paint machine, and those in use at the expos tion grounds are under the direction of C. Y. Turner, the assistant director of decoration. Mr. Turner is a member of the National Academy of Design, and prominently identified with a number of the leading art societies of the country. The principle involved is the use of color mixed with compressed air. The compressor is a rotary one, which, when driven by an electric motor, compresses air from 15 to 18 pounds a square inch; this air is then mixed with calcimine, and both are impelled through a hose upon the surface being painted or calcimined from the nozzle in the hands of two men on the scaffolding. A large part of the interior work in the Electricity and Agricultural Buildings has been done by means of this apparatus.

An Interesting Transportation Exhibit.

J. E. McNay, Treasurer of the Northeastern Railroad Company of England, contributes to the railway division of transportation exhibits a unique picture of the opening of the Stockton and Darlington Railway, the first in the world used for the conveyance of passengers. The artist was a native of Darlington, and the point of view chosen by him for his sketch is the railway bridge over the Sherne at this place. To the right and left of this drawing will be hung the original announcement and programme of the opening and the original and first time table. Above it an enlarged photograph of the No. 1 locomotive will be placed.

Why the Other Fellow Caught the Trade.

Here is a feature of the retail tin, stove and plumbing trade that is open to study and criticism:

Bill Whitney and me went to school together, but when I was 12 years old I had to hustle for my living, took care of the horse, swept the shop and was as useful as the boss of the tin shop where I worked. Bill always was a good feller, never got stuck, and not only finished our school but went through college, then came home and went in with his old man; but though we always spoke, we did not hobnob much as we did when kids.

I stuck to biz, because I had to. Didn't have time for reading, which put me to sleep after a day's hard work out of doors. So what Bill called rhetoric was scarce in me; but I saved my money, and now the boss' business is my business, and I know how to do good work and won't do any other kind, or won't sell any other kind of goods, for it don't pay.

Well, I was dirty and not polished, and as the town boomed another feller started and he talked sweet, wore a biled shirt but didn't know the trade. He never learned it and did some horrible bum work, but the way he talked of products of combustion, transverse sections, conflicting energy and things was equal to a college professor, and the people just dumped the dollars in his till, for they thought because I could not talk sanitary and sich that I wasn't even sane. Well, Bill Jones got married and built a house and gave me a show, but when he asked me about scientifics I wasn't in it, but the other fellow talked it as glib as ice and Bill, wanting a good cage for his bird, thought the other fellow knew it all and he done the work.

Well, I done it over and Bill blames me for knowing my business and not knowing how to talk to the boys I grew up with intelligently so as to get their confidence, and says I ought to be poorer than what I am for not giving my brains a show, and he is brushing them up and I dress more to suit my wife and hang me, if the talk and clothes ain't bringing me trade.

George Baker, an old and well-known resident of Albany, N. Y., died at his home on South Pearl street, that city, January 1. For 30 years he was in the stove business, and at the time of his death was conducting a stove store at 16 Green street.

C. H. A. Dissinger, Wrightsville, Pa., is the patentee of an improvement in metal seaming tools, the invention consisting in providing such a device with a vertically moving jaw as is adapted to hold the same close while giving the overlapping portion a downward bend by the act of lowering the lever connecting with the member, and to release the same by the act of raising the lever.

D. W. Cree of Griggsville, Ill., has retired from the stove and hardware business, and is now devoting his time exclusively to the sale of Cree's camp stoves in connection with furniture and wall paper.

THE LETTER BOX.

Plans for a Store.

From C. F., *Erie, Pa.*—Compliments of the season 1893, and may *The Metal Worker* flourish and prosper as of yore. Being a constant reader of your paper for the past 15 years or more, I think, and having received a great deal of valuable information, I should like some of my brother chips to give me a little now. I am thinking of putting up a business building in the near future and, knowing that I could receive no better advice from other sources, I ask this favor from those who have had some practical experience. To start with, I wish to put up a good, plain building, adapted to light hardware, tinware and house furnishing goods. There is to be no tinshop, as that is in another building. The size of the store is to be 38 x 75 feet, using the basement and first floor for my business, with living rooms on the second floor. The points I would like suggestions about are the best arrangement in store of shelving and counters, balconies or step ladders. Whether to have a balcony across the rear; whether to have one entrance or two; where to have the desks and the best way and mode of heating. The first and second floors of building to be of brick, with galvanized iron front. How shall I arrange the store front to prevent frost? What is the best style, size and shape of a small, cheap elevator from basement to first floor? I might also add that I am having a 16-foot alley made at one side and will have a side door to receive or deliver goods without having to pass through the front of the store. Now I know that among your readers some have had experience in building and no doubt can give me a great deal of very valuable information. I should consider it a great favor if any one would be kind enough to give me a little of their experience.

A Curiosity from the Country.

From E. C. M., *Madison, Wis.*—In regard to the apple problem in your paper of December 2, would say the premises are wrong. Thirty apples at 3 for a cent and 30 apples at 2 for a cent are not the same as 60 apples at 5 for 2 cents. The proof is as follows: Thirty at $\frac{1}{3}$ cent each and 30 at $\frac{1}{2}$ cent each make 2 of the apples cost $\frac{5}{6}$ cent, or 0.835 cent for 2 apples, which would make an average of 0.4166 each. Now, 60 apples at 5 for 2 cents would make the 2 apples cost $\frac{5}{6}$ cent, or 1 apple $\frac{5}{12}$ cent. Sixty apples at 0.4166 each is 25 cents and 60 at $\frac{5}{12}$ each is 24 cents, which solves the problem.

From A. B., *Hamilton, Ohio.*—Referring to the letter in *The Metal Worker* of December 2 about an apple problem, my solution is as follows, viz.—the 60 apples should have been sold for 25 cents, or at the rate of .0041666 each, which price per apple should have been fixed by averaging them as follows:

2 for 1 cent would make them ..... (.0050)
3 for 1 cent would make them..... (.0033)
(.0083) ÷ 2 = .0416

The seller of the apples made a mistake in selling them at 5 for 2 cents, which is .00400. The error on 1 equals .00416 — .00400 = .00016. The error on 60 would be 60 times this amount, or .0099, or if carried into indefinite fractions 1 cent.

From A. M. R., *Rochester*, N. Y.—Allow me to give you my solution of the problem under the heading of "A Curiosity from the Country." I found several ways, but the following seems to me the most simple, viz.: On the first sale of 30 at 3 for 1 cent he gets 10 cents for the lot, and on the second sale of 5 for 2 cents, 12 cents, a gain of 2 cents; on the second lot of 30, on the first sale he gets 15 cents, while on the second sale, or 5 for 2 cents, he only gets 12 cents, a loss of 3 cents, making a net loss of 1 cent on the 60 apples.

From P. H., *New Madrid, Mo.*—I thought I would have to give up the apple problem, but I have got it all right now. Five apples for 2 cents holds good only an equal number of times for each kind of apples, viz.:

10 x 3 apples for 1¢ = 30 apples for 10¢.
10 x 2 apples for 1¢ = 30 apples for 10¢.

Now we still have ten apples of the two for a cent variety, which bring the other 5 cents. Five for 2 cents would not work after the 3 for 1 cent supply is exhausted. The apple vender lost 1 cent. The undersigned has fooled away 6 cents in postage and about 3 cents worth of stationery over it.

Note.—It is necessary to say, in explanation of the final clause in our correspondent's letter, that the communication we print is the third one received, as he offered a solution, then he sent in a withdrawal of it, and finally we have the one which we print. We are sorry to have him put to 6 cents expense, but we feel sure that the experience he has gained was well worth the outlay.

Material for Gutter.

From W. D. M., *Sunbury, Pa.*—I would like to be informed through the columns of *The Metal Worker* what material to use for a gutter that was lined with XX bright tin, but which has become so defective that a new one is required. The matter of expense is not to be considered, providing something is secured that will prove durable.

Answer.—While our correspondent has neglected to give any particulars regarding what caused the gutter to become defective, it is presumed that bright tin is not adapted for the purpose. Where coal is used for fuel it is necessary to protect the surface of the tin used about a building, which can be done by painting. The joints in a tin gutter must be well soldered in order to prevent cracking caused by the expansion and contraction of the metal. Did the gutter mentioned by our correspondent fail through neglect of either of the above requirements? A number of materials have been used for lining gutters, as terne plates, lead, galvanized iron and copper. Terne plates would appear to be well adapted for the purpose, if properly joined and laid, and protected from corroding influences. Sheet lead has been used for gutters, but is not calculated to give satisfaction when laid upon sheathing boards in the way common to tin plates. Galvanized iron is quite durable as long as the zinc coating remains intact, but when used as a gutter lining difficulty may be encountered in making the joints sufficiently strong to resist the expansion and contraction of the metal. Copper is a very desirable metal to use for lining gutters on account of its durability, but due provision must be made for expansion and contraction or the joints will become leaky, even when well soldered. This much said, we should be pleased to have our readers give our correspondent the benefit of their opinions.

Blue Prints Direct from Original Drawings.

From JAMES F. HOBART.—In reply to "D. H." of Chicago, Ill., who asked in a recent issue how to take a blue print from an original drawing and thus save time and trouble of tracing, I would offer a method which, though somewhat expensive and troublesome to successfully carry out, will be found to give good results.

Before describing the method I wish to call attention to the fact that the idea of saving anything by working from the original drawing, instead of from a tracing, is entirely wrong. In order to make an acceptable print at all the drawing must be done in good black ink, either India ground from the cake, or in Higgin's liquid India ink, which is sufficiently good for all purposes. It is no more work to make the ink drawing on a piece of tracing cloth laid over the pencil drawing than it is to put the ink on the paper direct. It is for other reasons much better to use the tracing cloth for the ink and keep the original drawing in pencil, for, as almost every drawing has to be changed, the desired removals can easily be made on the pencil drawing with rubber and a hard pencil, whereas if the lines were inked in the task would be a tedious one.

In case of extensive changes, a new tracing can be made, and the changes incorporated therein. By this method the original drawing is not subject to wear or the risk of being soiled, and may be kept as choice as one pleases in fire-proof safes or vaults. Should, however, a man get hold of an inked-in drawing, or should he wish to copy some engraving, he can make the paper temporarily transparent by wetting it with benzine, naphtha or turpentine. This substance evaporates very quickly, but is prevented from escaping by the plate of glass which is laid over the drawing during the printing process. The great trouble with this and similar processes is that it takes too much time to print, owing to so much of the sunlight being stopped by the thick paper in which the drawing is made. Were it not for this, the problem would be a very simple one.

PRINTING SOLUTION.

The best way out of the difficulty is to use some liquid which is more sensitive

than the ordinary blue printing solution, and which will therefore require less time for sufficient action of the sunlight. A solution which will print through ordinary paper in 30 minutes consists of 10 grains of bichromate of potash and 20 grains of sulphate of copper dissolved in 1 ounce of water. This mixture is spread as evenly as possible over the paper with a brush or a sponge, and then dried. The paper is then exposed under the drawing in the same manner that blue prints are made and shows a faint copy of the drawing in yellow. The print then must be washed over with a solution of 20 grains of nitrate of silver in 1 ounce of pure rain or distilled water. The print will then change to a brilliant red color, and is finished like an ordinary blue print by washing in pure water until all the chemicals have been removed. The above method does not give a blue print, but it may be changed to a greenish blue color by soaking in salt and water. In a few moments the picture will entirely disappear, but if the paper be held in the sunlight the picture or print will appear again of a greenish blue color.

When it is necessary that the time of exposure to sunlight must be reduced to a few seconds instead of minutes resource must be had to the salts of silver for the sensitizing solution, instead of the salts of iron or potash as used thus far. Silver paper, technically known as "bromide," cannot well be prepared by the printer, but should be purchased ready for use of a dealer in photographic materials. This paper is very sensitive to light, and a dark room lighted by red or orange colored light is an absolute necessity. There are three kinds of the paper in the market, and the thin, smooth kind should be chosen, especially if it is to be used as a negative from which to again make a print of the ordinary kind.

The sensitive bromide paper is sold in three kinds, and marked respectively "A," "B" and "C." The kind marked "A" is the variety required for the work in hand, the other kinds being either on thick paper or with rough surface for finishing with crayon. The bromide paper will be found to be very expensive, a dozen sheets 8 x 10 inches cost over $1. But where one sheet only is used to a drawing the actual expense is not as great as appears at first sight. By using one sheet of bromide to a drawing it is assumed that ordinary blue prints will be made from the bromide print, which really is made to take the place of a tracing.

THE BROMIDE PROCESS.

There is one point in favor of the bromide process and that is prints can be made by it in the night, although, of course, the printing process is much slower than when sunlight is used. The drawing is prepared for printing in the same manner as for an ordinary blueprint, only a dark room must be used for handling the paper between the original package and the printing frame, and again during the removal therefrom, and the developing process which the exposed prints must be carried through. There is no outwardly visible change to indicate when the exposure has been completed, therefore it is well to experiment a bit with a small piece of paper placed under the drawing. Let the part of the drawing under which the test piece is placed be covered with a thick piece of dark cloth when exposed to the sun, then, watch in hand, slide back the cloth, exposing a strip of the bromide paper. After, say five seconds, slide the cloth back again, exposing another strip. Then another, and another, until half a dozen have been exposed, the last for five seconds, the first for 30. Then, when the test strip is removed to the dark room and developed, the part which received the correct time of exposure will give a perfect print. The rest of the slip will be either too light or too dark. Once the proper time of exposure and kind of paper is determined, all drawings on that kind can be exposed with confidence, the only allowance necessary being for the strength of the light at the time the exposure is made.

THE DEVELOPER.

A developer is required for this kind of paper, which from the very beginning to the end must be handled with great care and cleanliness, both as regards the developer and the paper. The former is made up in three separate solutions, and mixed together only when used, as it does not keep well when mixed. A fourth solution called a "restrainer" is also used, but in such small quantity that a little of it goes a good ways. For making up the solutions two bottles will be required with a capacity of 32 ounces (2 quarts), one which will hold 8 ounces (½ pint), and one of almost any size, say 1 to 4 ounces.

Into the smaller bottle put one part bromide of potash and 9 parts of water. This makes a 10 per cent. solution, as it is called. Into the 8-ounce bottle make a citrate of ammonia solution by dissolving ½ ounce of citric acid in 2½ ounces of rain water. Then add ammonia (stronger) till a slip of red litmus paper immersed in the solution will just lose its color, then and rain water to make up the whole volume to 4 ounces. Mark this bottle "C." Procure 4 ounces of oxalate of potash and dissolve in 15 ounces of clean rain water. Then add 30 grains of citric acid and 1 ounce of the "C" solution. Place in one of the large bottles, and mark "A." In the remaining bottle dissolve 2 ounces of sulphate of iron in 16 ounces of pure water, then add 8 drops of sulphuric acid, and mark the bottle "B."

When ready to develop arrange the dark room and its red or orange light, then remove the exposed pieces of paper from the tight box in which they were placed after being exposed, and put them in a tray or other flat dish containing clean, pure water. It will be better to begin with one piece of paper, then, after a little of the "know-how" is acquired, as many as seven or eight pieces can be handled at one time, both in the preliminary bath and in the developer. While the prints are soaking in the clean water (this is only to prevent staining by the developer, which might flow unevenly over the paper were it put on dry) mix the developer, which is formed of one ounce of the "B" solution, two ounces of "A," one-half ounce of water, and three to six drops of the potash solution.

Turn the water off the paper, being careful from the time the paper is first taken out of the original package till the picture is finished and dry, to keep the fingers off the face side of it. They will leave a stain every time, and it is best to make use of paper large enough so that it can be handled by the margin, which can be cut off after the picture has been finished. If small paper, the exact required size must be used, keep the fingers off, and handle by means of a glass rod or some other means. After the water is turned off pour on the developer with a flowing motion which will cause it to cover the entire surface of the paper with one sweep. Keep the tray in motion so the developer will not stand still, or it may spot the print. In a few seconds the lines will begin to appear when they are dark enough, or rather when the ground between the lines is well blackened, pour off the developer or if other pieces are to be developed, remove the print to another tray and flow with water; then place in a solution of hyposulphite of soda, 1 ounce to the quart of water. Allow the print to remain therein at least ten minutes, then soak in several changes of water for at least one hour, after which the print may be dried and pronounced finished.

If the thin bromide paper A is used for this purpose, a blue print may be made from the bromide on a bright day by an exposure of ten minutes, or even less. The blue print will possess the advantage of being a "blue positive," which presents a much finer effect than the ordinary blue print, as the lines are blue on a white ground. It would be well to experiment on a few small prints at first, say not more than 4 x 5 inches, and when the "trade is learned" on these begin with larger prints. It is a troublesome process at the best, and unless great care, cleanliness and exactness are observed at all times the whole business will surely be a miserable failure. When, however, success is obtained, the results will well repay for the time and trouble spent.

From J. P. A., *Newport News, Va.*—Replying to the inquiry of "D. H.," Chicago, Ill., I would say that drawings made on cardboard are rendered temporarily translucent by flooding the drawing paper with purified benzine of the best quality. This liquid soon evaporates without injuring the drawing. While in the translucent state the blue print may be taken.

Hydraulic Cement.

From A. B., *Buckingham, Canada.*—Please inform me if there is a cement that will set under water and resist water where there is no possibility of drainage. If so, please let me know what it is.

Answer.—Our correspondent does not state what sort of work is to be done, but if it is in the masonry line we recommend him to use Portland cement, which is a material of world-wide reputation and can be purchased of any large dealer in building materials. Portland cement is what is known as hydraulic cement—that is, it will harden under and resist water. Gad'a cement is also another material that might be used. Its compesition is described as follows: Clay, well dried and powdered, 3 parts; oxide of iron, 1 part; mixed together and made into a stiff paste with boiled oil. This is used for work required to harden under water.

A Remedy for Frosty Windows.

From G. L. B. *Portland, Maine.*—Referring to the question of frosty show windows asked by a correspondent in *The Metal Worker* of November 19, if he will make his inside showcase perfectly tight, or approximately so, so that no warm air can enter from the store, he will have no trouble with condensed moisture on his outside glass. Five years' experience makes me sure of this. There is no need of ventilation in the outside window.

A Rubber Cement.

From C. T., *Croghan, N. Y.*—Can you furnish me the receipt for making rubber cement, such as is used for cementing wringer rolls on shafts?

Answer.—We presume the manufacturers of wringers have special cements for the purpose, so we cannot do better than refer our correspondent to a cement which it is said will fasten rubber firmly to either metal or wood. This cement is prepared by making a solution of shellac in ammonia. It is best made by soaking pulverized gum shellac in ten times its weight of strong ammonia, when a slimy mass is obtained. This in three or four weeks will become liquid without the use of hot water. The cement softens the rubber and becomes, after the ammonia evaporates, hard and impermeable to gases and fluids.

An ordinance adopted in Philadelphia after much discussion makes it a nuisance to run a locomotive or stationary engine with soft coal.

ROOFING AND CORNICE.

Roofing and Cornice Trade.

BUILDING OPERATIONS, on the extent of which depends the prosperity, or otherwise, of the roofing and cornice trade, were, in most parts of the country, undertaken on a more extensive scale during the year 1892 than has been the case for some time past. In the Eastern and Middle States especially great activity in this respect is reported, while a very fair amount of building has gone on throughout the West generally. In and around Chicago, of course, preparations for the World's Fair have given a vast impetus to the trade and created an almost unprecedented demand for building material of all kinds, and this has benefited manufacturers in many other parts of the country, as the capacities of local concerns were not equal to the demand.

The Southern States alone show any falling off in this industry. The general financial depression which prevailed throughout that section of the country up to within a few weeks of the close of last year was unfavorable to enterprise of all kinds. But the prospects for the building —and, necessarily, for the roofing—trade have brightened very considerably in the South since then, and the outlook in this respect is much more cheering for 1893.

In almost all branches of the business, roofers and cornice makers send us reports of improved trade in the past year. These reports are usually coupled with expressions of confidence in the outlook for 1893, based on estimates for building work now under contemplation.

WESTERN TRADE.

From a large metal roofing manufacturing corporation in St. Louis, however, we get a rather less favorable estimate of prospects in the West. They write as follows: "We are not 'boomers' for 1893. In our territory several causes presage a quiet demand for that season. In our cotton States the crop is smaller than in 1891; in some parts of Texas decidedly so. The price is better, but a great deal was sold before the advance, so the factors, not the growers, reap the benefit. In our agricultural districts we are met with unusually low prices for the cereals. In our mountain coast States the low price of silver lessens the demand for our goods by checking the establishment of new plants or the repairs or extensions of old ones."

The majority of our correspondents in the trade nevertheless advise us that prospects for a good and growing demand for roofing and cornice material during the present year are decidedly bright in their different districts. From Minneapolis we are advised that prospects for the roofing trade through the Northwest for 1893 are particularly bright—much building is in hand, or projected—but the general complaint of all trades, that competition keeps prices down so close as to materially affect the margin of profit, is equally the cry of the roofing men. More money has to be laid out in advertising and more push and hustling employed to get business by those concerns which do not handle some specialty that lifts them out of the crowd. Staples are hard to sell, with so many novelties coming into the market. Changes in fashions have to be watched almost as narrowly in the building world as in that of dry goods. Roofing materials are now so varied and complex in character that the general roofer is kept at his wit's end to meet the possible requirements of customers. We are told that terra cotta roofing tiles have made a long step into public favor in the last 12 months. Sheet copper, too, has been more in demand in the Eastern States than ever before; while the various kinds of metal shingles and other coverings are constantly being added to.

PHILADELPHIA.

Next to Chicago, perhaps the most favorable reports of the roofing trade come from Philadelphia. Manufacturers of standing in that city speak of gains in the volume of trade, reaching from 25 to 50 per cent. over the previous year, with business on a firmer basis than before. The demand has been pretty evenly distributed for sheet metal, slate and tiles. This prosperity has existed along with exceedingly sharp competition, and evidences a very large amount of trade. Prices, however, are stated to be exceedingly close, so much so that some of the principal makers refused large contracts in favor of smaller ones, where somewhat larger margins of profit were assured. Specialties have held their own prices pretty steadily, and those manufacturers who handle such goods report far better pecuniary results from them than from their general lines.

New machinery and appliances for the better and more efficient production of metal roofings are noted as having been introduced into several factories, but little of particular note has been done in this line.

Some of our Western friends mention some difficulty in making collections promptly; and this drawback has been also felt to some extent in Eastern States.

Strikes in various quarters have affected more or less seriously the roofing business. This element has been felt in most of the large cities; but that phase has passed, for the time at any rate, and work is now undisturbed by labor troubles.

Iron and Steel Roofing.

Corrugated iron and steel roofing has had an upward tendency ever since the new tariff went into effect. A larger business was done in this material during 1892 than ever before. As a Western manufacturer of sheet iron writes to us, "the volume of business has been much greater than in 1891. Not only the 12 months, but each month has shown an increase over the corresponding periods of last year. Competition has been sharp, but our own territory took so much iron that we did not feel it much. Margin of profit is probably a little better than for 1891."

From one of the largest Eastern makers of steel and iron roofing material we learn there was a falling off in the sale of corrugated iron and -crimp, but a more than counterbalancing gain in high-grade standing seam and roll roofing. The falling off was attributed to quoting higher rates on the material in reply to large inquiries than was done by some Western companies, who are able to purchase the raw material near their plants and save a heavy rate of freight, which the Eastern maker has to pay. The same concern express a belief that the demand for sheet metal in 1893 will be far in excess of 1892.

Metal Shingles.

Increased business in metal shingles for roofing and architectural purposes is reported, with a tendency at the same time to cut prices to a ruinous extent. A Western correspondent in this line speaks of 33⅓ per cent. gain over 1891, with good prospects on a close margin of profit. An Eastern concern tells us of increased foreign trade in metal shingles and siding plates.

Roofing Slate.

A slate company in Pennsylvania give us good accounts of the industry in that district. They remark as follows: "We have had three years of good trade, and this year has been the best. A steady demand that has been fully up to the supply." It is thought, however, that the range of prices might be established on a more profitable basis to producers. The concern above mentioned say: "It is now entirely a question of supply and demand. The jobbers take orders at such figures that they are obliged to ask manufacturers to make concessions to fill them. The indications now are that in the near future Pennsylvania slate manufacturers will enter into an arrangement whereby their goods will pass through one channel, thus stopping the jobber and consumer from peddling their orders."

In New England the granite workers' strike, by causing a suspension of building operations for some time, operated unfavorably on the business of the State quarries. The adjustment of that difficulty has, however, given a new start to the building business, and a greatly increased trade is looked for by New England slate roofers in 1893.

Improvements in the preparation of slates for roofing have been introduced in the drilling and countersinking each slate ready for putting on.

Canadian Roofers.

We are favored with reports from roofing and cornice concerns in Montreal and Toronto, Canada, which speak of increased business during the year, partly attributable to the number of grain elevators erected lately in all parts of the country. Although this source of business is not likely to continue to yield as much profit this year, prospects are looked upon as good. Preparations are being made for a large amount of European travel through the country this year, going to or coming from Chicago, which it is hoped will help general trade.

Competition in the Dominion continues keen, causing a sensible decrease in profits on individual sales.

Conductor Pipe.

From the West, we are advised that the manufacture of corrugated conductor pipe has proved very satisfactory, showing a considerable increase in 1892, notwithstanding the fact that a number of new concerns have lately embarked in the production of this material.

The Country Cornice Shop.—I.

By Cornice Worker.

How many country tinners are often called upon to do some little job or other in the cornice line, but who lack the experience which only long service in this particular branch can give. A tinner who was competent might receive such orders as putting up eave troughs that run around the corner of a building, for which miter patterns would be required, or he may be called upon to put up a sheet-metal hood over a cottage entrance, for which other patterns would be required.

It has often been the case in the writer's experience that carpenters would prefer to have old wooden crosses on spires or elsewhere replaced by those of sheet metal, such as copper, zinc or galvanized iron, owing to the tendency to decay when what is worth doing is worth doing right, one job will bring another.

In some of the country towns, growing in population, brick buildings are put up, for which galvanized sheet-metal cornice work is required, such as molded gutters and cornices, plain crown molds, plain dentil cornices, modillion cornices, cornices with brackets, sills and window caps, door hoods, &c. Garden vases could be constructed with wooden frames on the inside, for plants. Baptismal basins, when not made in marble, are sometimes made from heavy sheet zinc, the outside being painted to represent marble or granite. Or, let us suppose that a flag pole is to be put up on a conical spire, the roof of which is covered with shingles, and it is desired to have a sheet-metal base covering the joint between the pole and shingles, so as to obtain a water-tight job. The tinner, not having a circular molding machine, would have to hammer the metal by hand. The method of doing this work and the way to construct the cheap home-made tools required will be fully illustrated and described in the following articles on cornice work. Again, a schoolhouse being erected, the tinner might be required to furnish a square or octagon ventilator for the roof, for, although not exactly cornice work, it would be required of the cornice maker.

As mentioned before, all this and many other kinds of work would occur in a country cornice shop, which can be done by the tinner, providing he will take a little pains to study out the several articles which shall follow.

To illustrate the work resulting from accurate patterns, obtained by the geometrical rule, and those produced by the cut and try method, I will describe an incident which occurred some time ago.

Being in a tin shop on business, and waiting for the party to return whom I desired to see, I noticed one tinner having three pieces of tin pipe, each about 10 inches long and about 4 inches in diameter, from which he wished to make an offset by the cut and try method. A brick was placed upon the bench and against the wall, which I presumed was the distance the offset was to project over the brick water table on a building. He had now cut his miter on one piece of pipe and was sighting it to see if his cut was straight, and placing the pipe just cut upon the two other pieces, the miter lines were marked and cut. After tacking the offset together, it was found that one angle was too obtuse, and the other too acute, so the tacks were opened and the miters trimmed, fitted and tacked again; then, holding one side of the offset against the wall and over the brick, it was found that the center piece of pipe in the offset was trimmed too much and would not pass the brick projection. The tacks had to be opened again, another sheet of tin rolled up and a new miter cut. All this goes to show that had the tinner been able to cut patterns for elbows of any angle by the

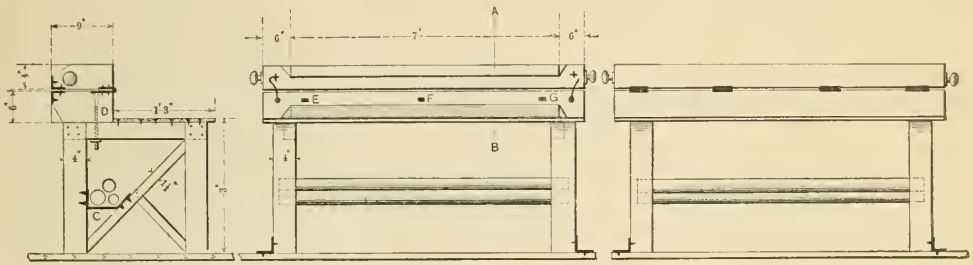


Fig. 1.—End, Front and Rear View of Brake for Country Cornice Shop.

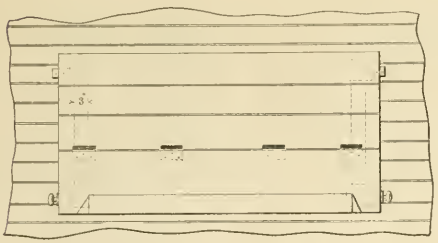

Fig. 2.—Plan View of Brake.

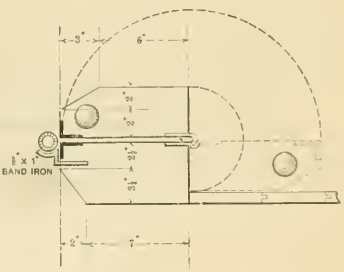

Fig. 3.—Enlarged Section through A B, Front View, Fig. 1.

made of wood. The writer has also seen wooden church spires, the miters of the different moldings having been drawn apart from the heat of the sun, which had to be covered with sheet metal so as to obtain a water-tight job. Such cases are more than likely to arise in any country place, and the tinner or sheet-metal worker would be called upon to do the work. Another job that may turn up is where a sheet-metal sign is required, the letters or figures having perhaps beveled corners; or a lantern is needed having the letters or figures cut out of the sheet metal, and colored glass fastened on the inside for effect when lighted at night. I remember a country tinner for whom I cut two sets of patterns for tombstones, which he informed me he would make of No. 22 gauge galvanized iron or 16 ounce copper, the copper having the preference on account of lasting the longest. I merely mention this because a country tinner might receive such an order for sheet-metal work if it was known he could do it, this class of work being chiefly made of wood in the country towns. Let the tinner become known for doing small jobs of cornice work and, providing

A HOME-MADE CORNICE BRAKE.

As the majority of country tinners have not the service of a cornice brake, one must be provided which shall be simple and inexpensive, but still turn out a fair rate of work.

The accompanying diagrams, therefore, have been prepared to explain how to construct such a brake. Let Fig. 1 represent the end, front and rear view of brake; Fig. 2 the plan. Fig. 3, which represents the enlarged section through A B, front view, also shows clamp and pipe in position, and upper leaf of brake opened, as indicated by the dotted lines.

Construct the bench for the brake as shown in the end and front view, Fig. 1,

the uprights being made of 4 x 4 inch joists, braced with 1½ x 3 inch spruce strips, as shown, and which can be obtained from any carpenter. On each side of the brackets, form, of $\frac{3}{16}$ x 1½ inch band iron, a small angle, which screw to same, as shown at C, end view, Fig. 1. These form a good angle for keeping the pipes when not in use, and where they will be handy when needed. The bench should be fastened well to the floor, with angles bent of suitable band iron, as shown in Fig. 1, front and rear view.

To construct the brake obtain a piece of hard wood, from which saw a piece 6 inches by 9 inches by 8 feet long for the bottom and a piece of 4 inches by 9 inches by 8 feet long for the top, the corners to be beveled as shown on front and end view, Fig. 1, and in plan, Fig. 2. The inner corners of the brake are to be inlaid with angle iron of ¼ inch by 1¼ inches by 1¼ inches, as shown on end view, Fig. 1, and enlarged section, Fig. 3.

make the bend. The different ways of making the different molds and gutters will be fully explained further on. In Fig. 3 is shown one of the clamps, which should be made of ⅜ x 1 inch band iron, three being required for the brake, as indicated in the front view, Fig. 1. In cutting the holes E, F and G in the lower leaf of the brake to receive the clamps, care must be taken that the clamps fit well in the openings made so as to obtain stiffness. Care must also be taken that they are cut on a line parallel with the edge of the angle iron, and that the clamps are all of one size. If the clamps are not of even size, or the holes are not cut on a horizontal line, that is, parallel to the angle iron, the bar or pipe will not rest level on the three clamps. Ordinary gas pipe can be used in 8-foot lengths, made perfectly straight. For each different mold a different size pipe will be required, and for that reason we must have as many different size clamps as we have

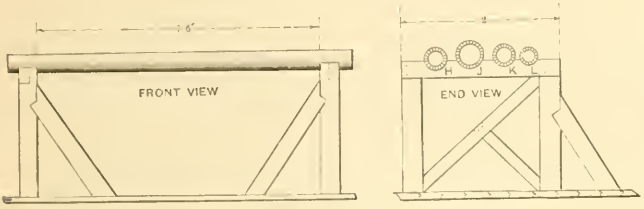

Fig. 4.—Front and End View of Ridge and Gutter Former.

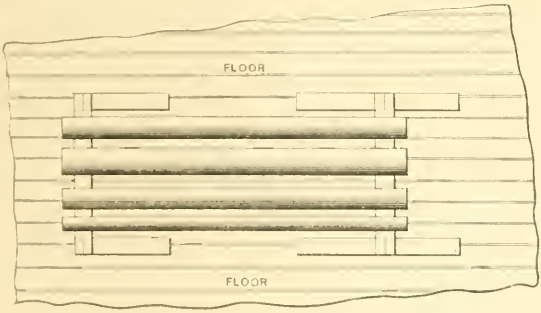

Fig. 5.—Plan View of Former, Showing Pipes in Position.

Four hinges, which can be obtained from any dealer in hardware, are to be screwed on the inside rear of brake, as indicated in the enlarged section, Fig. 3, the dotted lines showing the sweep of the brake. The position of the hinges is also shown on rear view, Fig. 1, and in Fig. 2.

After the angle iron is in place and the hinges in good working order, set the brake upon the two brackets and bolt through the wooden joists with two bolts ¾ inch by 12 inches, carrying nuts and washers, as shown at D, end view, Fig. 1. When the brake has been well secured obtain two large hooks and eyes from a hardware dealer, which place in position as in front view, Fig. 1. Two knobs are also to be attached, as shown in the same illustration.

Having described the construction of the brake, it will be well to briefly explain the way the iron is held, and later the use of the brake will be referred to. First grasp the knobs, and raise the top leaf until it has the position shown by dotted lines, in the enlarged section Fig. 3. The sheet or piece of iron having been placed on the lower leaf in the right position, the top leaf is raised and closed, the hooks drawn through the eyes, and we are ready to

different size pipes. In bending the clamps care should be taken that when the pipe is placed in position half of the pipe will project over the top of bottom leaf, as shown in Fig. 3. With these directions any person should be able to construct the brake as shown.

RIDGE AND GUTTER FORMER.

In making half round gutters and forming ridges, fronts of brackets and modillions, we require two stationary brackets, as shown in end and front view, Fig. 4. These brackets are to be constructed of the same material that was used for the brake. In forming or rolling the gutters, ridges, molds, large pipes, &c, the pipe, when laid across the top of the brackets, has a tendency to roll one way or the other according to the pressure. To obviate this we cut cross grooves on top of the joist, corresponding to the size of the pipe used, as shown by H, J, K and L in Fig. 4, end view. Fig. 5 shows the plan view of former, with pipes laid in position. The use of this former in practice will be explained as we come to the subject.

HATCHET AND MANDREL STAKES.

Fig. 6 is an end view of bench, showing the hatchet and mandrel stakes in position. These can be purchased from any dealer in tinners' tools, the former costing from $1 to $4, according to the length of the blade, and the latter from $3 to $8, according to the size required. The stakes are important tools for moldings of small lengths, such as finials, bases, hoods, caps, panel heads, letters, figures, and many other little things that might be mentioned, as will be explained at the proper time.

Preserving Tin Roofs.

Among the subjects discussed at the second annual convention of the New Jersey Association of Master Painters and Decorators, held at Long Branch in July of the present year, was that of the best material to be employed for preserving tin roofs. The discussion was opened by H. A. Barbier, who spoke as follows: In relation to the wearing qualities of paint and the best paint that can be used on a tin roof, I do not think there has been any systematic examination into this matter by either the local or State association. As I have made roof painting a specialty, I will give the results of my experience, hoping that they may be of benefit to some present. I have found that the three paints most in use are graphite or plumbago, metallic and yellow ocher. When I first learned my trade we used pure yellow ocher in the section where I lived. After preparing the tin by scraping the resin and washing with benzine, we used two coats of ocher ground with yellow. The average life of the roof was two and one half years. Within the last two or three years

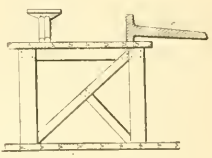

Fig. 6.—Hatchet and Mandrel Stake in Position.

I have taken up the matter of graphite paint. I have tried that in two ways. First, scraping the roof with resin and then washing with benzine, and then giving two coats of graphite. I have found, however, that by applying two coats of graphite there was lacking covering power, the paint was ground coarse and it was not quite satisfactory. I discontinued the method of treatment and gave as a first coating red lead. Then I made a mixture of graphite paint in oil. I kept track of that roof for three years, and I found it in first-class condition, and that it does not need repainting. It seems to me that this matter is of sufficient importance for the association to take up. My suggestion would be that we take up this matter from different parts of the State. Some live far from the sea and others near it, and there is a vast difference in the wear of paints in different sections. I think it would be a good idea to have three or five prepared tin plates with material and expose them and report at the next convention their relative wearing value.

Mr. Test: I happened to learn my trade on the Pennsylvania Railroad, and I think we had as many tin roofs to paint as there

are anywhere. Their idea of painting then was two coats of red lead and one metallic. Prior to that, in 1876, I painted a house in Philadelphia at Twenty first and Vine, and I put two coats of red lead and a coat of ocher on top, and that roof is there to-day and has never been touched since. I knew that this discussion was coming up, so I looked at it two weeks ago. That is too long for a roof to last for the good of the painter. I painted a roof in my place seven years this August, and I put a coat of red lead on that and then red metallic ; that roof is good to-day, and it does not need painting, and will stand two or three years longer. I have noticed in painting gas holders where there is more actual wear and tear that the paint which is used, and which will last longer in the gas holder, is metallic paint. I have used this many years and sell it. I have found that if a person takes pure ocher right straight through it is as good as any, but you don't find a person in a hundred who does, because the people, if you charge them more than a half or three-quarters of a cent a foot, think you are robbing them.

Mr. Buckel: We don't have much roof painting in our section, and I have not given it much attention, but we generally use the metallic. I cannot say that it is generally satisfactory. The best I have used is Venetian red, which is better than the metallic. It strikes me that the use of red lead and the metallic on top is better. I think that the idea of painting tin plates and exposing them is a good one.

H. A. Barbier: I would like to add to what I have said, that I have tried the metallic paint, and that the oil lost all its virtue, and by rubbing the hand over the roof all the outside came off in a powder.

A. S. Barbier: I take it that the best material you can use is one not active in its nature. From the discussion we have had there have been two things suggested, the one ocher, the other graphite. Pure ocher is rather inert, and is durable, and the same applies to graphite. Another thing in reference to graphite—while there may be some graphite paints on the market which are equally good, there is as much difference between graphite paints as there is between ocher mined in France, known as the best French ocher and that mined here and sold as French, which does not act the same under atmospheric conditions. That paint which oil leaves quickest contains the most active material. I have never superintended the painting of a roof with two coats of metallic or graphite paint, but I have put the graphite paint on old metallic and found it durable. One thing must be borne in mind, that Prince's paint is the cheapest that can be used on a tin roof. One thing in their advertisement has struck me and made me think a little. It says : "Mix 7 pounds of dry Prince's metallic paint to 1 gallon of linseed oil." The metallic has the best body of any paint. Did it ever strike you why they take 7 pounds of dry metallic and 1 gallon of oil? The reason is they don't grind it in oil. You can draw your own conclusion. I think it would be better if the painter took, for instance, dry metallic and ground it. I don't think you could get any better If you bought it ground in oil, but you do get better if you grind your own. It shows that 50 cents' worth of this paint will cover 500 feet of roof. I had occasion to see how much surface a gallon of graphite paint would cover. It covered 558 square feet; but it costs $1.20 if you buy it ready for use, and if in bulk and paste it costs you 8¼ cents a pound with oil at 40 cents a gallon. So you see graphite is twice as expensive, yet, at the same time, it is twice as durable as metallic. The nature of good graphite paint is that it is almost insoluble in water, and water runs off it like water off a duck.

Mr. Cottam : I painted a roof on my house in 1886 with metallic and I have not touched it since. It is in good order to-day.

Mr. Holzapfel : My experience is about the same as Mr. Barbier's. I have used graphite on tin roofs and it lasts longer than metallic, but it costs twice as much. Graphite has a further advantage over metallic from the fact that it contains a principle which preserves the tin.

Mr. Test : Where are you going to get graphite paint pure? I had a schoolhouse a year ago, where the architect called for graphite. I sent for it and it all came off in six months. I took especial care to put it on, as I wanted to see what it would do, and we paid 13 or 14 cents for it. The covering power was not anything to begin with. In six months I had to paint the gutters over. If graphite paint is the paint, where are you going to get it? I have the first to see. Last Thursday, Friday and Saturday I painted a roof between 13 and 14 thousand feet. The committee went all around the country to examine roofs. What was their decision? They let me do it as I thought best. After examining graphite, I finally sent to a man whom I thought was honest and put it on.

Mr. Sharrock : We never use a pound of paint other than the metallic.

The President : In Passaic we don't use anything but metallic.

A. S. Barbier: Another point about painting roofs. Is it a good plan to let the roof rust before you paint it? The reason for that question is this : If you let iron rust before you paint, all the paint you put on, unless you clean the rust off, the rust will come through the paint in less than a year. It seems to me the best time to paint a roof is before it rusts, because sometimes the trouble with a tin roof is that the rusting keeps on through the roof. There is no question but what in Jersey City where the roofs are painted with metallic that they should be repainted every two years; they need it badly. The roofs which have been painted with graphite there have stood four and five years and even six. It costs twice as much to paint with graphite as with metallic. I think that it should be the aim of master painters to recommend durable material. If you get a job of painting a roof every four years and get twice as much for it you will make just as much as though you painted it every two years for half the price. I think a great deal lies in the oil used. I think that in roof painting two-thirds boiled oil and one-third of raw should be used. I painted the Mansion House at Moorestown, and if I remember rightly it was five years before it was touched. I had occasion once at New York to have charge of the work on the Academy of Music, and we painted with ocher, and the roof was not painted again for four years. These paints were mixed with two-thirds boiled oil and one-third raw.

Mr. Butler: It strikes us from Philadelphia that there must be something wrong with the tin or the material you use in New Jersey. We in Philadelphia expect a roof to stand four years. It is our custom to expect it to last that long. I have used some graphite and I think it lasts longer than metallic. One thing you have not touched on at all is the application of the paint. You start a man out on a tin roof with a wall or a whitewash brush and he spreads it in all directions. When the rain runs down the resistance is greater than when it is on a level. If the color is laid on smooth and even with the fall of the roof the resistance to the water is less and the wear is less. One will use benzine and color and another oil and benzine. I have not heard what they used when it came off in six months. In badly rusting roofs you will be apt to find that the coating of tin is very thin. The iron stands nothing. You take the old tin which is heavily coated and it will stand for years without painting; but the great trouble with many painters is when they come to paint a tin roof anything will do for it and anybody can paint it, and then we fine fault with the material. We have no right to find fault with the material without taking into account our own shortcomings. I think if we took the same trouble in painting a tin roof that we do in our other work it would last longer.

Mr. Ballinger: "The longer I live the more I learn and the more I am satisfied that we all should be humble students. Another fact that should be considered is the comparative cost between graphite and metallic. I agree with Mr. Butler that we expect properly painted roofs to last four years without difficulty. If a roof is to last six, seven or eight years with graphite paint, it would be a good idea so get at the cost and see whether it is economy to use the graphite or the metallic paint. I want to suggest that so that it will come out in the magazines and the trade can get the benefit. Two or three weeks ago I had a customer applying for an estimate for a roof and wanting the separate cost of graphite as against metallic. I said I had no experience with it and could not give it. If the fact can be got at that graphite costing three times as much is cheaper than metallic or if metallic applied every three or four years is twice as cheap, I think that the fraternity should know it; and I think the cost should come out and appear in the magazine.

Mr. Golden: We do not have as much experience in painting tin roofs as those living in cities. My experience is that metallic is the best in this section of the country. I use Prince's metallic with linseed oil, and I find them in very good condition when I come to paint them again. I think that Prince's metallic is as good as any, if not the best.

A. S. Barbier: I think I can enlighten the trade as to the cost of material. I have taken the pains to figure that point. One pound of graphite paint mixed in oil to the consistency to cover well over metallic will cost you 8¼ cents a pound. That is based on graphite at $12.75 a hundred in paste and oil 42 cents a gallon. One pound of that paint will cover fifty-eight square feet from several careful tests I have made. If you buy by the gallon ready mixed it will cost $1.20. You have in your hand the book of the cost of metallic paint and how many feet it will cover, and you can compare the two.

Mr. Thatcher: I think there is a great difference in the time of year you paint a roof as to how long it lasts. If you do it to-day, before the fall, the oil will be burned out while the hot sun is pouring on it; if you wait until the fall the oil becomes hard before it is burned out, and I guarantee that it will last as long again as if applied at this time of the year. If you take it on the seashore, where you know the salt air is death to any oil, it will not last near as long as a house inland. The house on the seashore must be painted twice where inland once. Another thing about plumbago—it is a first-rate pitch roof paint where you don't have to walk over it. In my own house where I have a pitch roof I painted it seven years ago and it is as good now as then. The oil is gone, but if you put water on it it runs off. I have painted the flat part twice since that time with metallic. It makes a great difference as to the time of year you paint a roof and the way you apply it. If you use a large brush on a stick it is bound to be ridgy, and it will catch the rain, and that surface will crack first. Another well-known fact, if you paint a new tin roof with the best kind

of material it won't last as long as if the roof had been on two or three years, as there is a scum on the tin which will resist the paint, and that is why it is said you should let the roof rust some before you paintit.

FLASHINGS.

A SHEET METAL ROOF, having a standing seam in which the bent or folded line of a cap piece is formed with lateral crimps to interlock with the top edges of the up turned flanges of the roofing plates and extend from the top or apex of the cap piece down toward the base thercof, has recently been patented by Louis H. Britton of New Lisbon, Ohio. A one-half interest in the patent has been assigned to Jacob B. Warner of the same place.

WARREN EHRET COMPANY, 432 Market street, Philadelphia, makers of roofing materials and building papers, announce that they will shortly open a branch office in New York, at the Seabury Building, 59 and 61 Maiden lane.

THE PENN IRON ROOFING & CORRUGATING COMPANY, Twenty-third and Hamilton streets, Philadelphia, have added a number of new machines to their plant for next year's work. The additions include a 40,000-pound stamping and pressing machine; one die-roll machine of 29,000 pounds, with 38 steel dies for the different branches of stamped work; one new swedging machine; 5 to 10 foot dies for special molding work; three crimping machines and 10-foot rotary shear.

AULD & CONGER, 100 Euclid avenue, Cleveland, Ohio, furnish us with a statement of production and shipments of Sea Green roofing slate for the past four years. This slate is handled by the Vermont Slate Company. The following cable shows a very healthy growth in this industry:

	Production.	Shipments.
1889	$138,692.45	$115,339.86
1890	152,958.45	178,304.04
1891	189,608.57	187,356.54
1892	201,527.19	192,997.24

TWENTY OF THE LARGEST slate quarries in the Slating and Bangor districts in Pennsylvania have, it is stated, been formed under a syndicate, headed by James L. Foote of Slatington "to market slate on a more business-like basis than has heretofore been used."

IT IS REPORTED that the Canton Steel Roofing Company of Canton, Ohio, whose plant was completely destroyed by fire week before last, will rebuild their works at Ellwood City, Pa. The proximity of Ellwood City to Pittsburgh, where ample supplies of steel plates and sheets can be secured, is put forward as one of the reasons for the probable change in location.

"BECK'S MAD BOY" is the title on the cover of a wonderfully funny picture booklet, for which we are indebted to S. Bowen's Sons, North Penn Junction, Philadelphia. We thought, on first opening the envelope, that the book was intended as a holiday gift for the juveniles. However, on examining it more closely, we found the pictures to be so excruciatingly funny that we decided to keep it for our own private delight and edification. The work, which contains a dozen illustrations in colors, is described on the title page as a "History of the Uses and Abuses of an Indestructible Paint." It is, in short, designed to advertise the merits and uses of Pecora Plumbago Paint, manufactured by the Pecora Paint Company, to the business of which S. Bowen's Sons are the successors. The first illustration within the cover is the "family tree," showing the genealogy of Pecora Paint, the main roots being labeled "Black Lead," "Plumbago" and "Graphite," mingled with such qualities as "Research," "Honesty," "Knowledge" and "Diligence;" while the branches bear fruit, in the various merits and uses claimed for the paint. The illustrations depict the hero, "Beck's Mad Boy," armed with a large brush and a pot of Pecora Paint, with which he adorns everything he comes across, from a tombstone to a policeman or the sacred white elephant. The situations are most diverting, showing a wonderfully vivid imagination on the part of the artist. The paint is, for instance, recommended for "corporation work," such as railroads, manufacturing concerns, &c. The tableau illustrating this feature represents a festive gentleman seated on a fire main engaged in smoking a large cigar, while a small bootblack is giving him a "shine." The ever-present Beck's Boy is, meanwhile, placing a coating of Pecora Paint on the abdominal protuberance of the unconscious "swell." Each picture is equally humorous; and we are sure the book will be appreciated by all who are fortunate enough to procure a copy. It is one of the most unique advertising pamphlets we have come across.

A ROOFING PLATE or shingle composed of a single piece of metal, longitudinally ribbed, has recently been patented by L. H. Montross of Camden, N. J. The rib has its turning edge bent inwardly and upwardly upon itself in such a way as to form a vertical or upright longitudinal locking groove. It also has a gutter and a nailing strip which is made integral with it. In operation the first shingle is properly laid on the roof board and secured by nailing through the nailing strip. The adjacent shingle is joined thereto by holding at a convenient angle and slipping its locking tongue into the locking groove of the preceding shingle, after which it is pressed down and nailed. The arrangement is such that each following shingle of a row covers the preceding gutter and overlaps the nailing strip, so that the nails are protected from the weather. This patent has been assigned to Merchant & Co. of Philadelphia.

A GUTTER PROTECTOR, comprising a covering portion connected with the front edge of the gutter and extending upward and backward of the roof a short distance, has recently been patented by John Grogarty of Decatur, Ill. The portion extending backward above the roof is perforated in such a way that the water falling on the roof and running down may readily enter the gutter. The covering may be made either of sheet metal or of wire gauze, as may be preferred. The gutters can be supported in the ordinary manner or the protector employed as a support for the outer edge. We understand that the protectors are made in sections in any desired length.

THE ILLINOIS ROOFING & SUPPLY COMPANY of Chicago have favored us with one of the calendars which they are distributing to their customers. It is composed of heavy cardboard, 11 x 14 inches, artistically lithographed and embellished with illustrations of the company's specialties. Attached to the card are leaflets for the months. The company manufacture Perfection steel roofing and handle Gilbertson's Old Method roofing tin, in both of which they enjoy a large trade.

A Steubenville, Ohio, dispatch speaks of the successful use of petroleum fuel in lieu of natural gas, which can now be supplied only to a limited extent to manufacturers in the Ohio valley. The Hall Steel Pump Company of Pittsburgh have furnished the necessary engines and other apparatus, and the oil used is obtained from the McDonald field. The burners used in the Acme Glass Works are made on what is known as the aerated fuel system, where air highly compressed is mixed with crude oil and a tremendous heat is obtained.

Points for Commercial Travelers.

The ideal commercial traveler for Mexico is described by Consul Fechet. He "should be a gentleman in manners and address and should speak Spanish fluently. The Mexicans are a polite and formal people in their counting houses, as well as in their homes, and often do not understand the more familiar manners of other nations. Politeness, patience and tact, joined to a full trade knowledge and ability to speak Spanish, will sell goods in Mexico. Goods are not sold in Mexico in the quick way of our own country; several days of chat and social intercourse often precede the closing order for a large bill of goods. Many questions must be asked and clearly answered; this is especially true when the Mexican buyer knows but little of American goods, and this ignorance is unfortunately but too common. As to the questions to be answered, the commercial traveler must know the weight, size and all the subdivisions his goods may present; manner of packing, sometimes the measurements (cubic or square), rates of freight from the United States to the town where he offers them for sale, customs duties, rates of exchange or difference in value between Mexican and United States money. In other words, he must be prepared to figure at short notice how much the goods he would sell will cost, laid down at the door of his customer, making proper allowances for possible additional customs charges, brokerage and municipal taxes. The commercial traveler able to figure quickly, within a few cents one way or the other, the cost of his goods delivered will get the order in preference to another man who when asked, 'What is the rate of freight, of exchange, the weight, the duty, packing, &c.?' can only answer, 'Don't know.' Every merchant worth dealing with in Mexico keeps a 'book of costs,' in which he has figured the cost prices of all his goods; and he can tell you very quickly how much the same article has cost him at different times, from different sources, and at different rates of exchange."

Here is a pointer on Mexican methods for the benefit of commercial travelers. They should always ascertain, the Consul explains, before soliciting orders in a town, if there is a license tax to be paid. Of late years certain States have imposed a license tax on commercial travelers, amounting in some cases to $150. It is almost certain that a considerable reduction can be obtained by promptly applying to the town authorities for permission to exhibit samples and solicit orders for a specified time. Samples brought to Mexico by commercial travelers are subject to duty if in such shape as to be salable merchandise. Duties may be saved by allowing the customs officers to cut or deface the samples so as to be unsalable, but still available as a sample with which to solicit trade. Or a bond for double the duties, to run six months, may be arranged, and within the six months samples must be returned to the Custom House and the bond will then be canceled.

San Francisco is expecting to derive important advantages from the construction of the proposed Mexico, Cuernavaca and Pacific Railway, upon which the engineers are now engaged When the road is completed San Francisco will be only 350 miles distant by rail to the city of Mexico from the nearest port. St. Louis, which is making special efforts to secure Mexican trade, is 1900 miles distant by rail.

"The Metal Worker" Competition in Skylight Pattern Cutting.

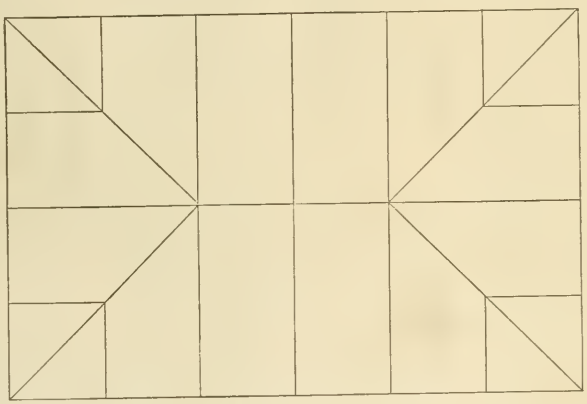
FOR the purpose of calling forth from the readers of *The Metal Worker* the best method for obtaining the patterns of a hipped sheet-metal skylight and to advance the art of pattern cutting, it has been decided to present a prize competition, the particulars of which are as follows :

Each contestant will be required to furnish the plans, elevations, necessary sections and profiles of skylight, also to design the various parts of same, giving to each part the shape that may be considered best adapted for the purpose ; drawings to be of such size as required for publication in *The Metal Worker*.

The skylight to be so constructed that the condensed moisture from below will be conveyed outside, the frame work of skylight to be made of sheet metal, and the usual thick glass to be used in connection with same ; the method of securing glass and caps to bars or rafters to be clearly shown.

While the plan may show a certain size of skylight, indicate the method by which one of similar pitch but different size can be constructed, the same miter patterns being used.

Show method of obtaining length of the various bars or rafters, using for the purpose any diagram, plan or elevation that may be necessary. Also show method of obtaining shape or section of hip bars.



Outline Plan of Skylight.

The skylight for which the patterns are required is such as would be placed over a light shaft, or on a roof or bulkhead, the size of opening being about 4 x 6 feet. As there is no particular rule governing the pitch of the skylight, it can be given such pitch as may be desired. While the wooden curb or frame of air shaft, roof or bulkhead is supposed to extend a sufficient distance above the roof to give ample opportunity for securing skylight to same, contestants will be at liberty to use such methods as appear best adapted for the purpose of fastening skylight, where brick and angle iron constitutes the frame.

The accompanying plan is not intended to give details of construction, but to indicate in a general way the shape of skylight for which drawings and patterns are required. Where there are two or more similar parts in the skylight, so that the pattern for one part will answer for the other, it will be only necessary to show details of one part. As indicated in plan, the skylight is to have a hipped roof, and as previously stated, the roof can be given any desired pitch.

PRIZES.

In the contest above described, two cash prizes are offered, as follows :

First prize.....$75.00.
Second prize..... 50.00.

The drawings and accompanying description may be sent by either mail or express, charges prepaid, and must reach the office of *The Metal Worker* not later than April 1, 1893.

They are to be addressed as follows :

THE METAL WORKER,
96–102 Reade street, New York.
(Skylight Competition.)

Each contestant is to select a fictitious name or device, which is to be placed on the description and each sheet of the drawings. The real name and address of the writer is to be put in a sealed envelope, on which is to be placed the fictitious name or device used on the drawings. This envelope is to be inclosed with the drawings and description.

The manuscript and drawings are to be sent flat, not rolled, and the writing should be on one side of the paper only. It is also suggested that legal cap paper be used for the description, the same size of paper for the drawings, and that ink be used for writing the descriptions ; the drawings to be either ink or pencil.

The various drawings and descriptions received up to the time set for closing the competition will be submitted to a committee selected for the purpose, who will decide between competitors.

In deciding between contestants, four points will be given consideration, as follows :

1. Originality.
2. Mechanical completeness of the method proposed.
3. Neatness of drawings submitted.
4. Clearness in description.

The right is reserved to publish all the drawings and descriptions received in this competition, and also to return to the authors the drawings and descriptions received in the competition in case they are not considered suitable for publication or worthy of an award of prizes.

Steam and Hot-Water Circulation

Steam and Hot-Water Boilers.

DURING the year under review, the progress of steam and hot-water heating has been unmistakable. It has proved equal to expectations in every respect. Reports received from manufacturers in this line in all sections of the country speak of satisfactory growth of business, both as to contracting and general sales during 1892. In Chicago the increase has been particularly noticeable, but this may be attributed to special and transient causes, in connection with preparations for the World's Fair, and will probably not be maintained in the same proportion during the present year.

That the demand for heating apparatus of this description has been at least commensurate with the growth of the country, is proved by the general testimony of the trade; and it is believed to exceed it in most quarters. The production of heating boilers during the past year has been considerably in excess of anything done in the same line before. A number of concerns mention 30, 50 and 60 per cent. increase in output; while, in some cases, business is said to have been more than doubled during 1892. These statements, taken in connection with the fact that in the same period quite a large crop of new concerns have taken up this line of manufacture, show that the adoption of steam and hot-water heating is widespread and growing.

A considerable number of new pattern boilers have been placed upon the market, especially combination types of steam and hot air, or hot water and hot air. Improvements have been generally made in the fittings of those types already known and used, in order to bring them up to modern requirements. Machinery and appliances for manufacture have been simplified and improved, reducing the cost of production; and a much better boiler can now be put on the market at a less cost, than was the case with the heating boilers of two or three years ago. In a word, steam and hot-water heating is coming more and more to the front as an important branch of industry.

Competition does not appear to have affected the trade adversely to any large extent. The field has been ample for the number of concerns hitherto engaged in the business; and the outlook, even in view of the expected increase in competition in 1893, promises well. A disposition is, however, noticed with some firms to take jobs more for the reputation there is in them than for the sake of profit. This is a feature which is to be regretted, in the true interests of the trade. On the whole, nevertheless, prices have been fairly maintained, with a reasonable margin of profit, and a closer affiliation between the manufacturers during the coming year is likely to lead to a more remunerative business. The expenses attending sales have been rather greater than heretofore. The steam fitter has to be assisted, and his customer visited by the manufacturer's salesman, in order to close sales. Appeal to the "house owner buyer" also costs more, in advertising literature of an attractive kind, and personal application. But gradual reduction in the cost of manufacture more or less offsets these increases in expenditure.

As regards the quality of work turned out, a correspondent in a neighboring city writes us as follows: "I think the whole trade is producing a better article than heretofore, and that the work done is of a much higher order. There does not seem to be the amount of work turned out with too little radiation and insufficient boiler capacity, as has often been the case before. In fact, people now demand first-class work and are willing to pay for it."

The car heating branch of the trade, too, has experienced a large augmentation in the volume of business; and our reports speak of bright prospects in this line.

The Master Steam and Hot Water Fitter's Association of the United States continues its good work in endeavoring to lessen the disadvantages of too keen competition and establishing a fair level of prices, by means of local associations throughout the country devoted to maintaining the well-being of the trade. The association has had much encouragement and hopes for more during the present year, in which its annual convention will be held at Chicago.

Radiators.

So far as the amount of business done is concerned, manufacturers of radiators have no reason to complain of lack of occupation. The volume of sales has been very large, and the demand for these appliances continues growing, according to our correspondents in the trade, at a rapid pace. One of the largest concerns making radiators in the Eastern States writes to us: "Our business has increased very materially; so much so, that for a large portion of the time we have been at our wits' end to know how to fill our orders. Never in the history of our business have we been so driven." Others report "much greater" or "doubled" business during 1892. Improvements in form have been effected, tending to simplification of construction and economy in operation, while the decorative capabilities of the apparatus have received special attention. Radiators embodying one or two novel features have been introduced, as noticed from time to time in the columns of *The Metal Worker*, and considerable progress in this line of work has been made.

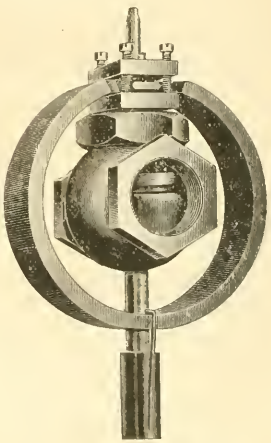
On the other hand, competition has been keener than ever; and the margin of profit on the ordinary run of goods tends to become closer. Those concerns who aim at excellence in their workmanship rather than at cheapening the cost of production, have, however, found quick recognition of the fact at the hands of customers in largely increased sales at fair prices.

From the growing popularity of the radiator system of heating, and the prospect of extensive building operations projected in many sections of the country for the present year, we judge that good business with moderate profits is assured to manufacturers in the coming months, should nothing unforeseen hinder the general trade of the country.

Our Canadian correspondents do not give us quite as favorable a report as do those of our own country. The legitimate radiator business in the Dominion is stated to suffer considerably from the efforts of foundrymen in other lines of manufacture to add this branch as a side line to their own trade, resulting in the stocking of the market with poor and cheap work done on unscientific principles. Profits have accordingly been cut down to a very small margin, showing a material depression since the previous year.

Powers Automatic Gas Valve.

We illustrate in the accompanying cut the Powers Automatic Valve for natural gas, made by the Powers Duplex Regulator Company, 90 Illinois street, Chicago,



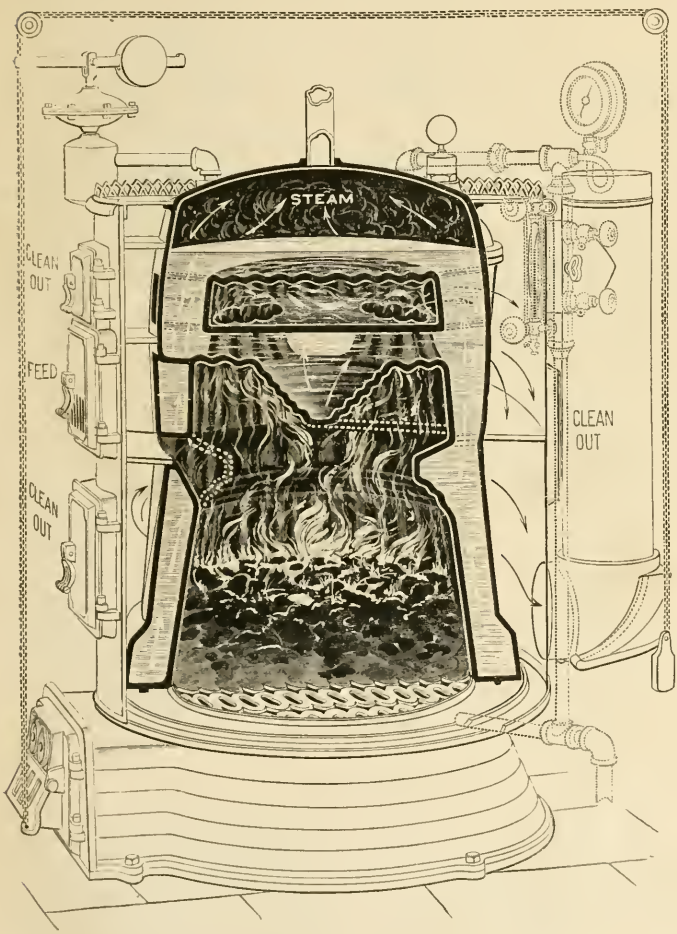
Powers' Automatic Gas Valve.

Ill. The valve is used with a Powers Automatic Regulator to control the supply of gas to any heating apparatus, and is similar in construction to an ordinary check valve. The valve is lifted by a rod resting in a cup into which extends a tube from the bottom of the valve shell, the cup containing mercury, which prevents the gas from escaping. Surrounding the valve and supporting the mercury cup is a magnetized steel ring, and between the poles of the magnet is a brass plate with a stem, to which the chain is attached in the same manner as to a damper. Underneath the poles of the magnet ring is an iron plate, in contact with which the magnet rests when the valve is closed, while above the magnet is a similar plate supported by four adjustable screws resting upon the plate below. When the ring is pulled upward with force enough to overcome the attraction of the magnet to the lower plate, it at once rises in contact with the upper plate, and the valve is lifted sufficiently to allow the passage of enough gas to supply the burner at the lowest stage at which it can be depended upon to burn without flashing and burning back in the air mixer. If the ring is lifted still further the upper plate goes with it, and the valve opens to its fullest extent. When the valve is closed by the thermostat the operation is gradual until the

screws in the upper plate come in contact with the plate below. The magnet is then held by attraction in contact with the upper plate until sufficient power is exerted to detach it, when it drops at once to the bottom plate, instantly shutting off the gas. By adjusting the screws in the upper plate the minimum supply of gas is secured that the burner will consume. The valve is said to be frictionless and very sensitive. It is made in various sizes from 1 inch and less up to 2 inches.

Perfect Safety Portable Steam Boiler.

The accompanying illustration shows a sectional view of the Perfect Safety Portable Steam Boiler that is manufactured by



Perfect Safety Portable Steam Boiler.

the Richardson & Boynton Company, 232 Water street, New York. The boiler, it will be noticed, consists of three sections resting on the ash-pit section or base. There is a conical fire-box section, water-dome section above and at the top the steam-dome section. The fire-pot section is 20 inches high on the outside and 16½ inches high on the inside, and permits a fire varying in depth from 12 to 16 inches. It is constructed tapering from bottom toward the top, and is corrugated and arched at the top, beside being all cast in one piece. Over this is the inverted water dome with circulating and drain connection, which is likewise cast in one piece and has four corrugated smoke flues through it, two of which are shown in the illustration. The manufacturers point out that the inside of the fire pot in the second section can be easily seen and cleaned through the feed door. Another feature noted is the four large water ways to insure a steady water line and perfect the circulation of water throughout the boiler. The steam-dome section, which is likewise cast in one piece, is accessible from the front clean out door. The boiler has a large combustion chamber, taking up the whole of the inside of the boiler, and which gives ample room for the gases to thoroughly consume. The large return flues encircling the outside of the boiler can, it is said, be easily cleaned through front and rear clean-out doors placed in the casing without interfering with the fire. The ash pit is 12 inches high and fitted with the Perfect Triangular Revolving grate. All the inside surfaces of the boiler are vertically corrugated and surrounded by water. The boiler has direct and indirect draft dampers, and is adapted for hard or soft coal. It is made in four sizes with 21 and 26 inch grate and 52 to 62 inches in hight, adapted to heat from 325 to 600 feet of surface. All the joints of the boiler below the water line are made on the principle of a flange union, being held together by 3-inch bolts on the outside of the boiler, and so placed as not to be exposed to the fire. The joints, furthermore, are milled. The boiler is covered with a non-conducting galvanized-iron casing lined with asbestos and wrought iron, and is said to be easily handled and can be taken through any door.

English Practice in Hot-Water Heating.—XVII.*

INDEPENDENT BOILERS.

The subject of gas boilers cannot well be left without referring to an ingenious introduction of Mr. Fletcher's. This is a water heater, or boiler, as Fig. 62. The peculiarity consists in the quantity of solid metal (copper, in this instance), pins projecting from the lower heating surface. Mr. Fletcher, in a paper read before the Gas Institute meeting, describes how he has ascertained by experiment that flame never has actual contact with surfaces which are at or below 212°, the temperature of boiling water. He adduced in evidence several facts to show that surfaces at this heat had a sort of repelling action, and between the flame and the surface there always exists a thin film or space, to the disadvantage of the water receiving the full benefit of the heat. The remedy proposed, and which he has brought into practice, is to furnish the heating surface with these solid pins, protuberances, or gills (all can be adopted to the same end), as, when flame is applied to their free extremities, it has ready contact, owing to the much higher temperature that they (the extremities) can be raised to.

It will be seen that although we cannot get a surface, having water on one side of it, hotter than 212° (and rarely this with boilers), if solid rods or projections extend from this surface sufficiently far, we can get their extremities red hot, although at their other ends they are in contact with water. Mr. Fletcher makes his rods about 1½ inches long; this permits the extremities to obtain 500°, and flame has actual contact at this temperature, and the greater and more effective heat so obtained is readily transferred to the water by conduction. Now, the peculiar effect of these rods does not end here. It has been common knowledge for many years that the affinity of water for heat—its heat-absorbing power—is two and one-half times greater than a plain heating surface can impart the heat to it. This power of water is met with these rods, which, being solid, go to increase the heat-receiving surface to the extent named without increasing the water surface. In other words, if the flat bottom of this little heater be a superficial foot, the addition of the rods make the actual heat-receiving surface some 2½ feet, and the superficial foot of water surface resting on the flat bottom is quite able to absorb all the heat of this greater heat-collecting area. There is now advertised a boiler tube made upon this principle having a series of flanges inside it, where the flames and heated gases have contact, and the makers contend that these flanges, which are solid, and simply additions to the heat-receiving surface, add fully 30 per cent. to the boiler-tube's effectiveness. Mr. Fletcher's experiments showed a really great difference between boilers that had the rods and those that had not. The length of the rods has a limit, as when the heat received is more than the water can dispose of, the extremities perish.

This little gas boiler would require to

* Reprinted from the London *Builder*.

be fixed in a house or little structure by itself, like the others. There must be free ingress of air for combustion, and equally free outlet for the products of combustion. This provision of inlet and outlet ventilation must, however, be unattended by violent drafts, or the flame will be blown out, or caused to "light back." In the former case a disagreeable effect might be experienced when relighting the burner by the explosion of the unburnt gas that may have collected.

INDEPENDENT BOILERS FOR COKE FUEL.

It will not be possible to enumerate more than a few of these, having distinct features peculiar to themselves. The number is too great to speak of them all. About the smallest and least expensive we rather small pipe, as shown. A coil is undoubtedly effective, for it presents a greater surface to the fire in comparison to the quantity of water it holds than any other water heater; it has the advantage of being wholly direct heating surface in contact with hot fuel. The drawback to coils is, however, that accumulation of deposit cannot be readily removed, even if some sort of provision is made for it. With this particular pattern accumulated dirt may soon do harm, as the pipe is small, and would be readily filled. Beard's coil boiler, to which we may presently refer, is considered successful, the pipes being 3 inches and 4 inches.

The next description of boiler to notice is Messenger's Loughborough, as Fig. 66. The peculiarity of this boiler, as every all makers, is the "dome top," as Fig. 68. This is a very good and serviceable form of upright boiler, and has had general use and approval for many years. This boiler has a water-way top, and is the first we have shown with the flow pipe starting vertically, which is decidedly the best way for it to start if the works are of any magnitude. It is unnecessary to describe this boiler in detail, the illustration gives what is needed in this respect, but there is one feature in the drawing which requires specially alluding to.

The feature in question is the water way, shown carried down below and beneath the fire bars. This arrangement, owing to the increased cost it incurs, is not generally adopted, but it certainly has pronounced advantages. In the usual way,

ENGLISH PRACTICE IN HOT-WATER HEATING.

have is what is generally termed the Star, as Fig. 63; it is, however, unsafe to give some of the old patterns, as this is, any specific name, for a similar design of boiler may be found in every maker's list, but not more than two will name it alike. This is a useful little boiler for small purposes, for heating a greenhouse or carriage house, or for two or three coils in an entrance hall. Its size does not admit of taking a charge of fuel to last many hours without attention, but it can be had with an extension, or fuel chamber, at top, as Fig. 64. They are also made with sloping sides that is, slightly conical—which assists the free movement of the fuel in its falling to replace that which is consumed below. These boilers are made to heat from 150 feet to 700 feet of 2 inch pipe (theoretical quantity), and can have the pipe sockets on right or left side or at back, as desired; the smoke nozzle can be on top or at back.

Fig. 65 represents a distinct form of small boiler, if it can be termed such, the heat receiving surface being a coil of reader must know, is its being adapted for building in the wall of the greenhouse. When it is so fixed, the stoking, &c., is all conducted outside, and the flue pipe is similarly placed; but the opposite side of the boiler projects inside the house, and the pipes are there connected. By this arrangement there is practically no loss of heat from the boiler, and the whole of the circulating pipes do good service in radiating heat. The only loss of heat is from the front surface, which faces outward. The writer cannot see any reason for making water-way fronts with these boilers. Messrs. Kinnell's Horseshoe boiler, of a somewhat similar design to the Loughborough, has an air chamber in front, by which the air which enters the fire is heated; this is in lieu of the water-way front, and seems a very good idea. Another good form of boiler for building in the thickness of the wall is Jenkins & Son's Ivanhoe. This has a fire-brick front, as Fig. 67.

A very good pattern of boiler, made by the water way terminates exactly level with the fire bars all round, except where the stoking door comes; it is arched here, as is necessary. Terminating the boiler at this point means that the lowest point of the boiler, where dirt accumulates, comes exactly where the very greatest heat is felt, and where it can bring about the most harm, and what aggravates matters is that a weld or joint has to exist at this important point. If the water way is carried below, as shown, the accumulation of deposit occurs below the point where heat is felt, and the dirt, being at this low point, can do no harm; but in addition to this, it is so much easier to remove the dirt from this flat surface than it is from the cylindrical space higher up. Added to this is the gain effected by the absence of welds and joints immediately near the glowing fuel—it is better to keep them away from this point. Welded joints are, as a rule, strong and very serviceable, but exceptions to this rule are not uncommon. If a boiler of this type is used for the sup-

ply of hot water at taps, and the water it heats is "hard," the water-way bottom is a very great advantage, and cannot be overestimated. The hard deposit is thus almost entirely kept away from the heated points where it so readily causes damage, and the removal of the deposit is facilitated. This hard deposit is difficult enough to remove at any time, but particularly so with cylindrical boilers having the water way ending level with the fire bars. The water-way bottom forms a sort of settling bed for sedimentary or precipitated matter of every description, as very little can adhere to the vertical surfaces just round the fire box. It will be understood that matter deposited anywhere else than just where the great heat is felt does little or no mischief.

There are several effective shapes of independent boilers that are not of vertical design, as we have hitherto referred to, but are horizontal, as Fig. 69, for example. These are nearly all much like square saddle boilers, placed upon iron bases and furnished with the necessary furnace fittings, making them independent of brick setting. The illustration shows one with water-way front and back, with top feeder. This is a very good form of boiler, can be fed to last the night without attention, but a deal of heat can be radiated and lost from its exterior if not covered, or if not fixed in a little close brick chamber. It could have the smoke nozzle on top, if desired. This style of boiler is made to heat up to 2000 feet of 2-inch pipe, and if fitted with internal flue or cross tubes is still more powerful. It is a boiler the writer has used, and has given every satisfaction. A square boiler can be cleared out with comparative ease.

The Business of 1892 in Steam and Hot-Water Heating Apparatus.

BY OBSERVER.

The present may well be regarded as the commercial era in steam and hot-water heating apparatus. The volume of business done in 1892 in boilers, radiators, valves and all that goes to make a complete modern house-heating apparatus has never before been approached since these justly meritorious systems of heating were introduced, and this large volume of business has been done at fairly remunerative prices, we think, to the manufacturer, jobber and local dealer. While prices have uniformly ruled a little lower than in previous years, this is but the result of more systematic methods adopted in the manufacture of this line of goods and the commercial importance of this branch of industry being more fully recognized by those engaged in it.

COMMERCIAL IMPORTANCE OF THE TRADE.

It is with this as with every other business—it cannot be recognized as being legitimately established until its commercial importance is fully appreciated by the public and all its interests treated in a commercial way. This, we believe, has more thoroughly prevailed during the past year than ever before and has been an important factor in impressing the public that these systems of heating have come to stay, that the experimental era has passed, and that the purchasers of steam or hot-water heating apparatus can now obtain that which is perfectly reliable, efficient and durable.

Undoubtedly, in years past this industry has been largely handicapped by the numberless experimental devices which have in many cases been costly experiments to all concerned, but this experience has led up to a more perfected apparatus in its every detail, until to day both low-pressure steam heating and hot-water heating systems are recognized, we believe, in the fullest commercial sense by both manufacturers, dealers and the public.

FUTURE PROSPECTS.

The universal expression among all the trade, as far as we can learn, is that the prospects for the future were never more auspicious than at present. There is no possibility of the trade being diminished in volume, excepting from some financial crisis, which would affect every business alike. The actual annual growth of this industry cannot but be very large, and we think the trade should justly appreciate the situation and endeavor to meet these demands.

The leading manufacturers of boilers, and radiators also, have this past year been pushed to their utmost to fill their orders. In fact, many of them have been literally "snowed under" at times. Consequently the trade and the anxious customers have had to exercise considerable patience, if not actually suffer loss. When we realize that this is the case with manufacturers who have, from year to year lately, increased their facilities by additions to their works, so that their output has been increased to an amount that would, in their judgment, meet the natural demands upon them and yet have fallen short, simply proves that the possibilities of this business are not generally recognized by the manufacturers of this class of goods.

UNIFORM PRICE ON RADIATION.

One thing that has apparently benefited the trade, and especially the local dealers, has been the uniformity in price on radiation. The universal expression seems to be an approval of this wise policy, and the recent action of the boiler manufacturers in organizing an association with the apparent idea of reducing the cost of manufacturing to a minimum and thus giving uniformity in price, will surely be beneficial to the trade and satisfactory to the public if it raises the standard of workmanship on this class of goods and still holds to a uniform minimum price. By these methods the cutting in prices will be avoided, which has proven the ruin of every line of business that was ever engaged in, and we hope that the wisest counsel will prevail in this direction.

NEW BOILERS.

During the past year there has been quite a number of new boilers brought out and many patented which the public as yet know nothing of. This is but natural in an industry as young as the steam and hot-water heating industry. Those who have an idea of a peculiarity in device will avail themselves of the liberal patent laws to protect their ideas; but those who have had experience in this business realize that, practically, there is so little difference between the new ideas and those of reputation established by use that little can be expected from the new enterprises which will naturally spring up. In fact these new enterprises will naturally help the business by bringing more thought and enterprise into it, but it is not preaumable that the demands for this line of goods will be able to afford a profitable business for all the manufacturers, both old and new.

GOOD WORKMANSHIP REQUIRED.

Where skilled mechanics are employed in erecting the apparatus we know of no failures that are worthy of mention. Both manufacturers and dealers in this line of goods can greatly benefit themselves and the trade by fostering a higher standard of work in every department. There, perhaps, is no one thing that has tended to retard the growth of this business so much as incompetent mechanics. This is shown in the manufactured goods, and is especially glaring in the pipe systems throughout the country. This comes largely from the local plumber or tinsmith, who, believing that there is money in doing work of this nature, intrusts the erection of the job to his mechanic, who may be skilled as a plumber or as a gasfitter, but who obtains his experience in steam or hot-water work at the expense of the local dealer and grievous disappointment and annoyance to his customer. No mechanic should be intrusted with the erection of this class of work unless he has had experience as helper, as it is detrimental to the best interests of the business to impose upon customers by putting in apparatus that has to be overhauled and corrected before it works satisfactorily. While we believe that local dealers in small towns can handle the work satisfactorily, they should not allow themselves to do so until they are confident of having in their employ a man fully competent to erect the same successfully without experimenting. While every manufacturer of either boilers or radiators is perfectly willing to give whatever information he can in regard to what the pipe system on any particular job should be to obtain best results, an unskilled mechanic, owing to lack of experience, is rarely able to carry out the instructions, and the result of his work invariably is dissatisfaction to the customer and pecuniary loss to the dealer. In many cases the dealer becomes so disgusted with his experiences that he condemns the systems, when in proper hands everything would have proven satisfactory.

STEAM VERSUS HOT WATER.

As the popularity of steam and hot-water heating increases, many inquire which system is best or which is most used. Both of these questions are difficult to answer, as each system has so many points of excellence; without question, however, the trade in steam boilers and steam radiators has been, the past year, largely in excess of that for hot water, but that the trade, in the smaller sizes of apparatus adapted for residences, is growing steadily with a tendency toward the hot water system, we candidly believe. Each system has a strong following of public approval, based upon their experiences with it, and deservedly so, as either of them, under ordinary conditions, will be found entirely satisfactory.

With the present outlook for 1893 there is every reason to hope that manufacturers and dealers throughout the country will work together for the best interests of this industry and elevate it to a standard of excellence that will merit the confidence and patronage of a discriminating public.

HEATING NOTES.

GEORGE C. BLACKMORE of Newark, N. J., is the patentee of a new form of radiator valve, the object being to furnish a construction of hot water radiator valve by which the valve may be opened or closed with a very slight movement of the hand piece. The invention consists of a flat seat and perforated disk pivoted upon it, with the seat secured in the bottom of a suitable casing and a concealed stuffing box secured in a recess in the top of the casing covered by a circular hand piece.

THE SCHUYLKILL VALLEY stove and heater manufacturers and dealers have had an extraordinary run of business during the past six months and are making extensive preparations for the coming year. In Reading, we are informed by the superintendent of the Keystone Steam-Heating Works that it has been almost impossible to meet the demand for prompt work. Work that ought to have been given out in the early summer was de-

layed until August and September, and although they put in as much overtime as the men could stand, they were constantly behind with their orders. From the same source we learn that about one-third of the work was hot water and two-thirds hot air or steam. An important adjunct to this class of business is ice and refrigerating machinery. The Keystone Steam-Heating Works have a number of orders of this character on hand and expect to be as busy on that work as they have been on the first-mentioned.

E. S. Bomstead & Co. of Colorado Springs, Col., have recently closed a contract for heating the Presbyterian Mission School in Santa Fé, N. M. The building is a large two story structure and will be heated by hot-water circulation. The device used will be the Spence hot-water heater, of which a number have been installed by the firm named in Colorado Springs, and which are said to have given entire satisfaction.

In a note in *The Metal Worker* of December 24 relating to the Fowler Radiator Company, we inadvertently gave the address of their foundry in connection with the name of the concern. We should have mentioned the Fowler Radiator Company of 435 North Broad street, Philadelphia, Pa., which is their business address, and to where all mail should be sent.

John A. Flajole, Bay City, Mich., is the patentee of an improvement in steam heaters, the object being to provide a cheap and easily operated apparatus, and at the same time provide for the full utilization of the heat developed by the combustion. Another object noted in the specification is to provide a combustion chamber and fire pot not liable to burn out and in which all the surfaces in contact with the fire are water surfaces. The type of boiler illustrated has the water space above the fire in horizontal water tubes.

We would express our obligation to the Matthews-Northrup Company, 179–181 Washington street, Buffalo, N. Y., for their new specimen book entitled "Some Proofs," with a copy of which they have favored us. The book is gotten up with the object of demonstrating what has been done, in the various styles of engraving, at the Complete Art-Printing Works of the company. While, of course, primarily intended as an advertisement for their business, the book is one which is of value and interest to any one with a taste for engraving and printing. It contains about 50 pages of engravings, with comments and explanations. The first page presents a colored map of the city of Buffalo, with small views of Niagara Falls, the Buffalo Library and the Matthews-Northrup Company's establishment. These illustrations are executed by the different systems used at the works, and show five separate kinds of engraving on one page. Throughout the work, we are told, specimens are given only of work actually done in the establishment in the regular course of business, no engraving having been specially prepared for the collection. The subjects cover a wide field, and include some exquisite work in wood engraving, metal engraving, phototype, or half line, zinc etching and wax, or relief line engraving, which would be a delight to collectors. The price of the work is $1.

Grand Master T. V. Powderly has bought a farm of 71 acres near Hyattsville, six miles from Washington, for himself and a syndicate of workingmen, with a view to establishing a group of factories and a co-operative workingmen's town. The site chosen is convenient to both the Pennsylvania and Baltimore & Ohio roads.

New York Trade Schools.

The twelfth season 1892–93 of the day classes at the New York Trade Schools, 1260 First avenue, New York, begun Tuesday last, and the usual opening exercises took place in the lecture rooms at 4 p.m., January 4.

It was the first term since their incorporation and the first opening of the day classes at which their founder, Colonel Auchmuty, was not present. In his absence the result of his work was very apparent in the order, routine and discipline he has originated, which, however, did not compensate at the moment for the want of his presence.

In addition to the day plumbing class, whose number is now 98 and which number will be increased to 110 in a few days, there is the bricklaying and plastering class, carpentry, house and fresco painting, and sign painting, as well as the day printing class, which has been at work since November and will continue until May, 1893.

At 4 o'clock the students of the various classes assembled in the lecture rooms. Every seat was occupied and numbers had to stand.

The proceedings were opened by Henry Brill, the secretary of the schools, who spoke as follows:

For the first time in the history of these schools, Colonel Auchmuty, their founder, and through whose benevolence they are maintained, is unable to be present at the opening session of the day classes. That he is obliged to be absent is a source of great regret to him. For some time past he has been confined to his home by illness, but that his thoughts are with you and your work, and that he thinks of your welfare, is shown by a letter he has written, and which will be read later on. I understand that not a few among you have come to the schools on the recommendation of former students, and thereby have heard of the interest he takes in young men. It is seldom that a graduate, when speaking of this institution, does not dwell on the kind treatment received and of the care bestowed by Colonel Auchmuty on those who come to the school. His interest in your progress is not lessened because of his inability to be among you, and it will be a great satisfaction to him when he hears of your well doing.

I have assembled you together this afternoon for the purpose of explaining the system under which you will work for the next three months. Before I begin, I want to welcome to New York all of you who are strangers here, and to all I extend a welcome to the New York Trade Schools.

Continuing, Mr. Brill described the courses of instruction which guide the manual and theoretical work of each of the departments, and explained the banking system in vogue of caring for the money the pupils bring with them and deposit in the office. He also told what medical attendance Colonel Auchmuty had arranged to provide should any of the students become sick, and concluded by introducing John Stanley Thomas of the Union Theological Seminary, under whose charge the Trade School lodging house is conducted. At Colonel Auchmuty's request Mr. Thomas read the following letter:

"*To the Members of the Day Classes:*

"I regret that I am unable to meet you this afternoon, and, as I may be confined to my house for some weeks yet, I send a few lines, which I have asked my friend, Mr. J. Stanley Thomas, to read to you.

I would ask you to remember that you have come here, many of you at considerable expense, to learn a trade; that to get the full benefit of the short course of instruction there is not a day nor an hour that can be wasted, and that the courses of instruction you will follow have been carefully prepared and can produce remarkable results, provided you are as anxious to learn as your teachers are to teach you.

"I would also most earnestly ask those of you who are strangers in New York to avoid saloons and making acquaintances in the streets. Those who seek your acquaintance do not do it for your good. I would also ask you not to indulge in practical jokes or in "chaffing," either in the school or in the lodging house. Although no harm may be meant, unkind feelings are sure to follow which will mar the pleasant relations which should exist among you.

"Mr. Thomas is living in the lodging house. You will find in him a friend to whom you can look for information or advice.

"Many anxious hearts will wonder this winter, are thinking now, how loved ones are spending their leisure time among strangers in this great city. May God grant that no evil befall you and that besides learning a trade you may learn the most valuable lesson in life—that by resisting temptation and turning from evil you can trust yourselves.

"Richard T. Auchmuty.

"New York, January 3, 1893."

Mr. Thomas then addressed the students as follows:

ADDRESS OF J. S. THOMAS.

Would that the thoughts and sympathies which stir my mind and heart could be put into words. There are groanings and impulses and holy purposes which live and move within the human breast that language cannot express. Like the ocean's wave they rise, and roll, and break, and die into a silence as deep as eternity. There are doubtless feelings untellable which exercise your minds as you enter upon a course of study and instruction in this great and growing institution.

Your presence here means that you have a noble desire for advancement in the scale of living. Every true man honors and applauds the worthy ambition of young men. May the highest aim which burns in your souls be splendidly realized is my sincere wish.

In entering upon a course of instruction in the New York Trade Schools you are associating yourselves, you are aware, with a celebrated school, standing pre-eminent among similar institutions. It would be out of place for me to attempt to pay tribute to the "Auchmuty System," so well known on account of the remarkable results produced through thorough application and skilled instruction in the manual and scientific branches of the trades taught. The rapid growth of the New York Trade School during the past 11 years is a living monument of its value and influence. The progress and positions of her students proclaim the expediency and success of the system used.

Sirs, it seems to me a credit to the judgment of any man to become a student in this school. Well may you entertain and cultivate a just pride in being members of the different classes.

I am heartily glad that the false and inconsiderate impressions concerning the trades are fast becoming things of the past. The idea that gifts and education belong only to the stated professions is a false one indeed. The advanced and advancing civilization of to-day declares wisely for more skilled artisans, and our great country, speedily progressing, demands the schooled workmen to meet the requirements of the hour's upward strides in the industrial world. The trade school system is supplying a great necessity of this enlightened age. Surely the founder of this school deserves all the rich and magnificent encomiums given his labors and enterprise. And may God bless him in his works of love, granting renewed health and strength, that he may continue to do good in upbuilding the aspirations of young manhood and to augment the beneficial influence of his thought and life upon the world. This thought reminds us that, by some special providence, men are raised up and endowed to create and promote certain schemes of beneficence. In the minds before me there may be a divine spark of achievement which

shall some day bless and irradiate the trade of your preference. May it be so!

So, gentlemen, let the spirit of earnestness which prompted your coming to the New York Trade Schools be incited by the anxiously guarded motive to do well in your work and studies as one of its members. Whatever success you accomplish the progress you make will not only reflect credit on yourselves, but will be an honor to the instructors of the institution we all represent.

Believing that each one of us shall feel a just pride and interest in the school, its welfare and increased popular reputation, I beg to humbly offer a few hints as we begin our life together in this great metropolis city.

Many a time have we seen bright playful children with cups and pipes blowing soap bubbles. Happy beings! Laughing and their young hearts leaping with merriment, they would blow into the air bubbles of beautiful colors glittering in the heaven-sent sunlight as they rolled out of the cups. You know how easily the orb-like beauty of them bursts in the twinkling of an eye. Just so there are many glittering fascinations of worldliness amid the restless dash and activity of this city that burst into empty nothings. In a heart-throbbing center where are gathered all conditions of humanity there exists the most appalling scenes and horrors of worldliness which thrill and sadden the heart. The temptations of New York life are awful and seductive. Evil in a hundred forms greets the eye and ear and presses hard upon young men to do wrong. Casting our lot here as students, let us beware of the insinuating grasp of worldly desires so subtle and magnetic, so destructive and fatal. The dazzle and glare of gay scenes and revelry are overrated by those who ha ve not experienced them. All is not gold that glitters, and a few hours of recklessness have produced an avalanche of despair, a whirlwind of soul-trouble, a manhood blackened and contaminated for a lifetime. Oh! that men would remember the toil and love of mothers' hearts. There are men who gratify personal desires for a little short-lived sport, and change bright prospects of a successful business career into disappointments and miserable failures. Gentlemen, while the terrible reality of life presses hard upon us, and the drumbeat of time's hurried step in this material world of hustling is heard, let us look above trifling things unto nobler thoughts and feelings and actions.

As each day seems to tick a second on the clock of time, may we push onward and upward, beholding the grand, all-glorious drapery of the universe; proclaiming unending gifts for man's appreciation and enjoyment. In this immense city there are numbers of fine places and sights for amusement free or at small cost. Let us take in these, and we shall enjoy pleasant, healthful and interesting entertainment.

Students, in all candor, let us cultivate the spirit of brotherly feeling, and share the joys and advances of fellow-students in the struggle to attain larger experience and knowledge of the several trades. It seems to me that we ought to delight in cordial conversations and congenial games to enliven and beautify the longing and thirsting of hearts for agreeable associations and companionships. Let us take in the proper entertainments and recreation while away from home—the grand central depot of all our hopes and fears and loves—that we may think the right, feel the right, do the right.

It is my heart's burning desire to be a friend in any way, day or night, in sympathy and word and act.

My rooms in the students' dormitory are open to all students and their friends, who will be most cordially welcome.

And brother men, I do earnestly hope that your progress in the different trades, that your private lives shall give you that satisfaction and happiness which comes from the consciousness of duty done.

William L. Thatcher, secretary of the Students' Movements, invited the students of the Trade Schools to the use of the club house on Lexington avenue near Twenty-ninth street.

A general conversation with the usual light refreshment brought the proceedings to a close.

The following is a list of the members of the day plumbing class:

DAY PLUMBING CLASS, 1892 AND 1893.

Thos. L. Tolan, Hornellsville, N. Y.
Albert E. Weiant, New Britain, Conn.
John A. Mangold, Moundsville, W. Va.
D. Leon Roberts, Moundsville, W. Va.
Edward Weikert, Canton, Ohio.
Thos S. Cochrane, Jr., N. Y City.
Wm. B. Freehsee. Lockport, N. Y.
Edw. Lohr, Johnstown, Pa.
Royal W. Pearson. Calumet, Mich.
Geo. L Roberts, Tunkhannock, Pa.
Frank Drake, Clinton, Iowa.
Hamilton E. Claflin, Hillsborough, N. H.
John S. Huestis, Crown Point, N. Y.
Robert MacNish, Peekskill, N. Y.
Wm. Haun, Lyons, Iowa.
John H. Kelsey, Lowell, Mass.
Walter F. Worth, Davenport, Iowa.
Ransom S. Sholes, Jr., Norwich, Conn.
Fredk. W. Herrich, Beverly, Mass.
Wm. H. Fox, Eau Claire, Wis.
Jas. D. Fellows, Belvidere, Ill.
Fred. A. Stebbins, Williamsburg. Mass.
T. Brainard Rouse, Colorado Springs, Col.
Chas. C. Howard, Mt. Vernon, N. Y.
Chas. W. Kreader, Tiffin, Ohio.
Christian B. Murhead, Portland, Ore.
Abiel H. Wordell, Fall River, Mass.
Geo. Holtz, Jersey City, N. J.
Aaron Serfass, Ashley, Pa.
Robt. W. A. Rodman, N. Y. City.
Bernard G. Dorscher, Charleston, S. C.
Gurdon Potter, N. Y. City.
Edw. M. Law, Fall River, Mass.
Edw. P. Fagan, Saybrook, Conn.
Hezekiah M. Clements, Liberty, N. Y.
Walter L Bell, New Rochelle, N. Y.
Wm. M. Mitchell, Springfield, O.
Chauncey R Morris, Falls Village, Conn.
Alfred E. Studley, Worcester, Mass.
Chas. E. Beardsley, Dunkirk, N. Y.
Geo. D. Herring, Yonkers, N. Y.
Harry D. Bertine, Mt. Vernon, N. Y.
Erneat C. Rosenthal, St. Louis, Mo.
Edw. J. Crowley, Ansonia, Conn.
Thos. H. Horwell, East Liverpool, Ohio.
John W. Onellett, Westbrook, Maine.
Jas. McConbrey, Green Island, N. Y.
Jas. D. M. Hall, Owego, N. Y.
Richard Evans, Lyndhurst, N. J.
Frank Schwarz, Corona, L. I.
Dan'l Merkel, Jr., Carlstadt, N. J.
Frank J. Hauser, N. Y. City.
John H. Demarest, Hackensack, N. J.
Irving G. Dimond, Penacook, N. H.
John Richards, Jr., Morrellville, Pa.
Robert Hoffmann, Milwaukee, Wis.
John V. Denise, Freehold, N. J.
Dennis F. Donovan, Bayonne, N. J.
Harry Wagner, Bayonne, N. J.
Irving Schondel, Highland Falls, N. Y.
Chas. G. Fisher, Catskill, N. Y.
Geo. S. Shumway, N. Y. City.
Charles F. Rudenauer, Wilkesbarre, Pa.
Albert K. Hood, Newport, N. H.
Benton R. Dibble. New Britain, Conn.
Alexander D. Perry, Belvidere, N. J.
Frederick Zulch, Norwich, Conn.
Alphonsus Cassidy, N. Y. City.
Ralph F. Putnam, Danvers, Mass.
Samuel E. Rights, Salem, N. C.
Otto A. Hotopp, Hoboken, N. J.
Chas. A. Babcock, Los Angeles, Cal.
Charles F. Kukuck, Hohokus, N. J.
Louis J. Schultz, Toledo, Ohio.
George. D. Adamson, St. Paul, Minn.
John Fox, New Britain, Conn.
John H Burkhard, Brooklyn.
Frank H. Higgins, Ithaca, N. Y.
Henry Whitehead, Los Angeles, Cal.
Levi V. Gillespie, Pine Bush, N. Y.
William B. Leavy, Bridgeport, Conn.
August Heimann, New Haven, Conn.
Geo. Everard Bauer, New York.

Sheet-Metal Manufacturers and Machinery.

Manufacturers of sheet-metal machinery, tinners' tools, &c., have in general experienced a year's trade which has gone beyond their expectations. The demand for heavier metal-working machine tools is increasing so fast that many concerns have been forced to make large extensions of plant to meet the requirements of their customers. Some of the leaders in this line of manufacture have extended their business to double its capacity during the year. Competition is not noticeably greater. In fact, the consolidation of some of the larger makers of sheet-metal tools has, in a measure, decreased competition. But smaller makers of presses, dies, &c., have lately come to the fore, and have secured some of the local trade of the cities in which they are located. Nevertheless, we are told by a company operating in New York State that "business has increased more than double of what it was last year; and since the latter part of the year we have taken in so much work that we shall be busy until spring, even if we do not get another order."

Another large concern, in the same line of business, who have recently made great expansions of facilities, state: "All our departments have been well filled with orders during the year. The prospects are thoroughly good, and we expect to make further extensions."

TINNING MACHINERY.

Some business is now being done in the manufacture of tinning machinery; and this is likely to grow to be an important branch of trade as the American tin-plate industry progresses and the demand for improved methods of operating the tinning process becomes more urgent.

Can-makers' tools have not been in such request as usual this year, owing to partial failure of the fruit crop; but canners are calculating on a proportionate increase in business this year which will make up for past deficiencies.

SHEET-METAL WARES.

Manufacture of sheet metal goods has progressed steadily, with sharp competition to combat and prices down to a low ebb. For the general trade and jobbing interests the outlook is regarded as good, and no unusual developments are looked for.

From the Pacific Coast come complaints that Eastern competition is considerably keener.

THE TWO PAGE ANNOUNCEMENT of the Mason Regulator Company of Boston, Mass., illustrates and describes a number of devices of much interest to steam users. Among the goods noted are the Mason Reducing Valve, the Mason Pump Pressure Regulator, the Mason Pump Governor, the Mason Steam Damper Regulator, the Mason Balanced Valve, the Mason Elevator Pump Pressure Regulator, and many other devices as well. Illustrations are presented and descriptions, with table of sizes and price-lists, are given in many cases.

THE PROMINENT ANNOUNCEMENT of J. F. Pease Furnace Company, Syracuse, N. Y., contains interesting references to their heaters, cuts being shown of their Hot Water Heater, Combination Hot Water and Air Heater and the Steel Plate Warm Air Furnace. This company make three patterns of steam and air combinations; five patterns water and air combinations; one pattern hot water heater and eight patterns warm-air furnaces.

TIN PLATES.

The American Tin-Plate Industry.

Even a casual retrospect of the American tin-plate industry in its progress during 1892 cannot but convince the most skeptical of the fact that such an industry does exist in this country; that it has attained very respectable proportions, and moreover that its advance has been rapid and gratifying in each quarter of the past year. This has been most noticeable during the quarter ending September 30, the last one for which we have official returns.

The report of Col. Ira Ayer, Special Agent for the Treasury Department, which was printed in *The Metal Worker* of November 5—a report based on the sworn statements of manufacturers, and therefore presumably authoritative and reliable—showed very clearly the large stride made in the manufacture of tin and terne plates in the United States during that period, as compared with the corresponding quarter of 1891, as well as with the first two quarters of the year 1892. The output of American tin plates for the three months ending September 30, 1892, is given in the document in question as having reached a total of nearly 11,000,000 pounds, as against 827,000 pounds in the corresponding quarter of 1891.

ABSENCE OF MERE SPECULATION.

The comparative absence of mere speculative business in connection with the American tin-plate industry is a very healthy feature. The great majority of those concerns who have embarked in it are in it with the intention of staying. True, a few of the firms noted as producers of tin plates in Mr. Ayer's last list may be doing so merely in a tentative way—running a pot or two experimentally. But even these are solid firms, most of which may be counted upon to enter more extensively into the business so soon as they are fully assured of the ground they stand upon. Not more than two or three producing concerns at the most have dropped out or suspended operations during the year. These were probably such as had entered unadvisedly into the business, without sufficient capital or experience to warrant them in doing so. But, on the whole, as compared with what has usually been the case during the inauguration of other novel industries, the proportion of bogus or shallow concerns engaging in the tin-plate manufacture was surprisingly small. The great majority are not merely nominally producing American tin plates, but are doing so in fact and to a very considerable extent. They are pushing the business with vigor and determination.

STEADINESS OF ADVANCE IN THE MANUFACTURE.

Many concerns are extending their plants, and most of them are constantly increasing the number of their stacks—adding new and improved tinning machinery; and in every way showing that, so far as they are concerned, the tin plate manufacturing industry has come to stay in the United States.

That such is the general feeling and determination among producers is evidenced by the reports of the recent meeting of the Tinned Plate Manufacturers' Association at Pittsburgh. Their unanimous intention of pushing forward and taking no backward steps was there voiced with no uncertain sound, spite of the prospect looming in the distance of a reduction of duties by the new Administration and the presumable advantage accruing to foreign competitors.

PROSPECTS FOR THE FUTURE.

The development of the industry in this country may possibly—and naturally—receive a temporary check from the uncertain and unsettled feeling now abroad. Projected extensions of plant and new works which were contemplated will, in some instances, be postponed until such time as manufacturers feel they have more solid ground to go upon. We learn that this has been the case with two or three concerns who had contemplated a large outlay in the erection of tinning plants, but who have now delayed, or temporarily abandoned operations, waiting the outcome of future legislation.

Although we cannot expect the industry now under consideration to be fully grown within a year or so after its inauguration, we may expect that it will not take so long to establish as was the case before it reached its maturity on the other side of the water, considering the advantages gained from the experience of others with which we start.

In no field of endeavor is anything worth doing achieved without struggle and difficulty, and so our newest industry will undoubtedly have to root itself and flourish through checks and probable discouragements which resolution and patience alone can conquer.

And we believe these qualities are not wanting among those concerns who are now using their best efforts in this direction.

POSITION IN EASTERN MARKET.

As to the position of American tin plate in the Eastern market we gather that, while there is a fair inquiry for all kinds, the demand for the better grades of domestic tin and terne is on the increase. The representative of a large tin-plate firm, who are both manufacturers and importers, recently stated that numbers of their old customers, who were of the most conservative, have of late discarded the foreign material, which they had always considered as the only kind suitable for their purposes in favor of American made tin plates, after a trial of the latter. He added that this is the general experience; for "that when once a customer is induced to sample a box and test its merits, he almost invariably adopts the use of the native article in preference to the imported." Consumers would appear to be becoming alive to the fact that not a little of the Welsh tin plates now being shipped to this market are not up to their original and ostensible standard, nor to the standard attained by similar grades of home production. Most concerns manufacturing American tin plates to-day report that they find a ready market for all they can produce, even though they ask, in most cases, slightly higher prices than are quoted for imported material. Little or no stocks are piled up.

QUALITY OF AMERICAN TIN PLATES.

That the average American plate is of a high excellence is admitted even by foreign competitors. It is this high standard that will make it win its way, provided such standard is steadily maintained. For certain guaranteed brands of American roofing plates there is a steadily growing demand in the Eastern market, which it is said to be difficult to meet; and the same is noted for the best qualities of bright tin plates, which for certain manufacturing purposes are in considerable request.

It is true that a large proportion of the tin plates at present sold as "American," have been made from imported black sheets tinned in this country, but coming within the meaning of the act as native production. That proportion is, however, steadily diminishing. More black sheets are being rolled in this country monthly for tinning purposes, while, judging by the official list of concerns who are already putting up mills for this purpose, or who intend doing so shortly, it cannot be doubted that we shall eventually have an ample sufficiency of this staple to meet the requirements of all the tin-plate makers in the country. Little attention has as yet been paid to the production of the cheaper grades of plates, and in these the imported article still rules the market unassailed. These will, no doubt, come in time, and some little attempt has already been made in this direction in one or two quarters.

DEALERS' OPINIONS ON THE SITUATION.

The opinions of a leading tin-plate merchant in the East are worthy of repetition in this connection. The individual in question states it as his conviction that "the higher grades of American tin and terne plate, which form the bulk of the present home production, are better in quality than the corresponding grades of imported plates—they are more carefully finished and evenly coated and are altogether handsomer plates; but," he adds, "I question whether they can yet be sold at a profit to the manufacturer in those cases where the price is brought down to the equivalent of foreign plates. The plates certainly cost more to make than the imported plates cost. The workmen's wages are much higher here than on the other side of the water, and other expenses in connection with the manufacture are in proportion. The plates are more carefully prepared and at a larger expenditure of time and material, and consequently of money, than are the imported plates. Then the main items—the black sheets—are dearer to produce here than they are abroad. If, however, the present high standard of quality is consistently maintained in our American-made material consumers will in time be educated into using the home product even at a slightly increased cost, for it is well known that many of the foreign tin plates of the best reputation which have lately come to this country have not been up to the standard claimed.

ADOPTION OF AMERICAN MATERIAL.

"At present, however, a buyer does not care to pay an advance of 25 to 50 cents per box on American tin unless fully assured of its superiority over the imported

article. Patriotism is a good thing, but it seldom much affects a man when it gets down squarely to a question of the pocket. If you were to put two boxes of tin plates, one of native and the other of foreign make, before your customers, price and quality being guaranteed equal, the majority would probably take the American material, but there would be a considerable number of conservatives who would prefer to use the foreign brands they had known and tried before. It will take a little time for this prejudice to die out; but when prices are equalized—provided the home-made plates keep up to their present standard—there is no question but that the American tin plates will attain general adoption and eventually oust the foreigner from the market. Some of the black sheets now being rolled in this country for tinning purposes are really superior to those imported. The quality of the latter have, I think, deteriorated lately, while the home-rolled sheets are getting constantly better."

PROSPECTS OF MANUFACTURERS.

"I do not think any lasting check will be given to the manufacture of tin plate in this country. Unless an extra session of Congress is held and prompt measures of change inaugurated, which is extremely doubtful, no changes in tariff are likely to be made before 1894. Meanwhile the industry will be growing and strengthening, and it will then be better able to stand alone than is the case even now. The prospects of a removal of duties may result in a weeding out of any bogus concerns, and will probably quash any that may be projected on unsound bases, but the *bona fide* manufacturers who are in to stay will, I think, go right along; and I have no doubt means will be devised to reduce the cost of production. Plates for plates, I am of the opinion that better ones are being made in the United States to-day than are turned out from any Welsh works, judging, be it understood, from the samples of their production sent over to this country."

POSITION OF EASTERN AND WESTERN MAKERS.

Another well-informed merchant, who is considered a good authority, says: "It is sincerely to be hoped that any future legislation may not so far discourage the pioneers of the new industry as to cause them to take any backward movement, spite of their assurances to the contrary. But for the present it is impossible to foretell what effect a reversal of the protective policy under which it was fostered may have on this manufacture. The removal of the present restrictions on the importation of tin plates may render it advisable for the Eastern makers to call a temporary halt in production, or even to suspend altogether for a time. In any case they would naturally be inclined to proceed cautiously for a while; and this I presume will be the course of most of them until something definite is known. Western tin-plate works, however, should have no necessity to interrupt their progress. The advantages gained for foreign tin plates in a reduction of price consequent upon lessened or removed duties would in the Western territories, I think, be almost neutralized by the cost of freight. So that they could not probably be placed upon the local markets at much, if any, cheaper rate than the home-made plates. The possible freer admission of foreign tin plates should not, therefore, much affect makers in the western part of the continent."

SUMMARY OF SITUATION.

To sum up, at present there are some 35 or 36 firms actively engaged in making tin and terne plates in the United States, while others are well forward in their preparations for commencing this industry—some of them independently, and others in connection with rolling mills or other works. Some of the new tinning establishments are among the largest and finest in the world, two or three of them, indeed, are said to be unexcelled by any in the Old World, with an estimated capacity of from 8000 to 15,000 boxes a week each. Tinning pots are being put in operation in all parts of the country, and the supply of native-rolled black sheets is increasing. As for labor, it has been proved that our own supply, in the shape of American youth, is quite sufficient, with brief tuition, to run all the possible tinning establishments likely to needed in this country. We'sh labor is not a necessity, for many works in the United States to-day are running successfully and even advantageously, independently of such help. There is nothing occult about the process of dipping and coating tin plates, and no secrets which cannot be mastered by the average intelligence. The raw material is, or will be, all at hand, with the exception of the pig tin. But that is a comparatively unimportant part of the manufacture, comprising but some 4 per cent. of the material in a bright tin plate, with less in terne. Besides, this metal can be obtained from the Straits and Australia as cheap as it can be delivered in the British market.

Taking all these conditions into consideration, and weighing the two sides fairly, we must put faith in the ultimate secure establishment and success of the native tin-plate manufacturing industry. Our esteemed sage, Mr. Josh Billings, advises against prophesying unless one knows. But we believe the prediction above expressed is warranted, although no one can really speak with absolute certainty on this question just now, as we are ignorant of the precise conditions under which manufacturers will find themselves—say in 12 or 18 months' time.

Speaking generally, it is difficult to look upon the much-discussed "Tin Plate Question" from a point of view entirely unclouded by political predilections. But we have tried to give herewith an impression of the situation as it appears from an unbiased standpoint, drawing our inferences from reports received and from the expressed opinions of competent authorities in the trade.

TIN PLATE.—IV.

Tinning and Cleaning Machinery.

The Rogers Tinning Pot.—Rogers' machine, Figs. 37 and 38, is a much more elaborate affair. It consists of a flux box, C, and grease box, B, fitted to the top of the tinning pot. The plates are fed on to the cradle H, clipped by the spring nippers D, dragged down into the coating metal and directed through the finishing rollers. On emerging from the top pair of these they are seized by the fingers N and automatically transferred to the revolving rack E, standing in front of the tin set. The bars carrying the clips D run at their lower ends in guides and they are given an up and down motion by side levers operated by a crank, F, the levers being balanced at their longer ends by weights. The plate to be coated is passed through the flux box between the guide plates G and caught by the spring clips. It is carried by the clips down into the molten metal, and is caused, by the bars of the cradle H bearing against it, to assume a vertical position, so that when it is afterward raised its top edge will be guided by the ribs M and the guide box I into the finishing rolls. The rack E consists of a pair of cast-iron bosses covered with a sheet of india rubber to prevent injury to the plates as they are dropped, and carrying a series of radial arms, between which the plate may be placed by the pick-up gear. At the moment when the pick-up gear is dropping a plate the rack is stationary, and a mechanical appliance causes it to revolve intermittently. By this means the plates are kept on edge, and separated, until they have cooled enough to be removed to the scouring machines without damage.

The machine is well designed and works with a surprising smoothness and precision. Of all other machines it has the advantage of least parts moving in the molten metal. By its use the wages of the washman and riser are saved, and the plates have simply to be fed one by one by a careful attendant. The output of IC 14 x 20 is about 80 boxes in the day of 24 hours.

Rogers also has a machine for coating large quantities of plates by means of a rack traveling continuously through a long metal pot. The plates, placed one by one in the rack, are dragged through a flux box and immersed edgeways and longitudinally in the coating metal for a greater or less time, depending on the quality of plate desired and the speed of the traveling rack. The rack delivers the plates into a receiving rack, from which they can be taken one by one and passed through the grease finishing pot. By this arrangement a given amount of labor will coat a very large quantity of plates; the weight of tin in the bath is small in relation to the output, and a uniformity of speed obtained in the movements insures a perfect uniformity of coating.

The above machines embrace all those which are typical of what may be called the vertical pot. The half round pot, by which the plates are dipped with a circular motion into a basin shaped vessel, has also met with considerable success. Such a form does away with a cradle and a similar gear rocking in the metal. On the other hand, it has the disadvantages that feeding rollers moving in the metal have to be provided, and these lick up a certain amount of tin, which is lost; there is a larger surface of palm oil open to evaporation; there is usually more than one firing grate necessary, and, finally, there is perhaps a slight tendency to coat more on one side than the other.

The best known machine of this type is probably that of Daniel Edwards, of which Fig. 39 is a diagrammatic view. In the tinning pot are several guides forming a rack, in which three plates at a time may be immersed in the metal. The plates are forced with the tongs into the nip of two pairs of rollers immersed in the flux box (the rollers being worked by intermediate gearing and worm and worm wheel), from which they are withdrawn, and forced under an arched guide into the nip of a pair of rollers immersed in a third vessel containing coating metal, and from thence up through the finishing rollers in the grease pot. The machine has an output of from 80 to 100 boxes in 24 hours, and the wages of a washman are saved.

R. B. Thomas' machine is very similar in idea, as indeed are a number of others. For ternes a very large number of simpler machines are in use, consisting of a half-round pot with one pair of exit rollers.

The Thomas Tinning Pot.—To complete this subject one other machine of this type is shown in Figs. 40 and 41. It is that of John G. Thomas, and is of such a form as to surmount many of the objections enumerated above. The grease pot is connected with the metal pot by a narrow gate or neck into and from which the plates are guided by rollers in the usual way. The difference in temperature of the two pots may easily be maintained as the connecting neck is so small. In the middle of the guides C which conduct the plates through the flux to the first pair of rollers are a pair of asbestos brushes set at an angle so as to clean the surface of the sheet of any

scruff or dross that may be adhering to it. The rollers are so arranged in bearings as to admit of their being adjusted and closed when required, and they are held together with arrangements of spring levers. Each roller is provided with a scraper, the position of which is regulated by rods passing in this country for a labor cost of from $1 to $1.50 per 100 boxes.

It is not unusual to find that the plates, after a preliminary scouring by hand, are passed by india rubber feed rollers between pairs of rollers covered with sheepskin and revolving at a high speed, a method which table at the moment of passing over a third drum. The action is illustrated by the diagram, Fig. 42. By this method, as will be seen, the plate is not plunged immediately into the bran, but in its passage has time to cool and harden, and it is turned completely over between the first and sec-

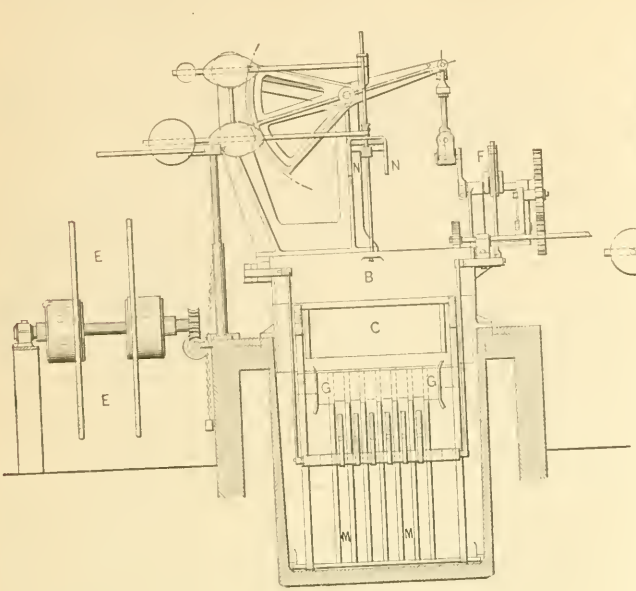

Fig. 37.

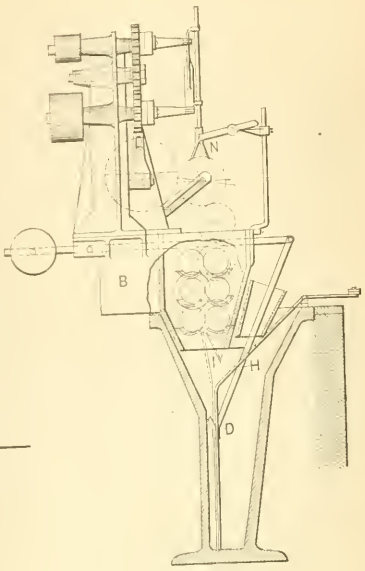

Fig. 38.

THE ROGERS TINNING POT.

to the top of the pots. The scruff which may collect on the top of the outgoing guide P may be removed by a scraper, R, shown in both views. At the surface of the metal, and where the grease rests upon it, are a pair of scruff doors, O, which practically inclose the guide P and retain the floating dross. The sweeping motion is given to these doors by connecting them with rods to the framing L. The levers shown have fingers which are acted upon by tappets fixed to the sliding bar B, and the doors are kept in their normal position, shut, by the spring Q.

Whatever machine is used, in order to keep the labor cost at the lowest possible point, arrangements should be made to deliver the plates one by one as they leave the finishing rolls on to a traveling endless belt or upright rack by which they may be carried to the scouring machines. Such a contrivance, though by no means generally used, will present no mechanical difficulties.

The oxide and scruff that is removed from the surface of the metal and grease from time to time is collected and melted in a cast-iron pot, the fining being done in the usual way with stirrers and chips of oak. Although ferruginous and not good in color, the ingots obtained may be used for ternes or the first coating pot. Zinc or other valuable elements in the flux are not usually recovered.

Cleaning and Dusting.—It is unnecessary to describe the well-known operations by which the plates are freed from grease and polished with bran and sharps and sheepskins, but it may be remarked that the appearance of the plate is not at all an unimportant matter to the seller and this department should receive much attention. When cleaned by hand, it is done gives a polish much superior to that obtained by hand and frees the plate of dust. Such dusting machines are commonly used. But scouring machines are not used to the same extent.

The Thomas Machine.—Thomas' machine may be described as follows: The plates, as they are removed from the grease ond bran boxes in such a way as to insure the proper cleaning of both sides. The cant given the plate in leaving the bran causes little of the latter to be carried away and wasted. The whole machine may be mounted on a wooden frame, inclosed on the sides, and it works with great precision.

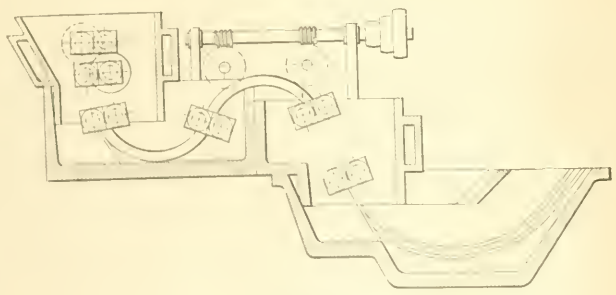

Fig. 39.

THE EDWARDS TINNING POT.

finishing rollers, are placed one by one on a fixed inclined cradle, from which they are taken immediately by fingers attached to an endless chain band traveling in a horizontal direction into the first bran box. The chain is turned over a drum in this box and travels again horizontally toward the second bran box, over another drum toward the far end of the machine, and the plate is dropped by gravity upon a

The Abbott Machine.—Abbott's machine consists of a pair of drums revolving in opposite directions in semicircular boshes and mounted with parallel axes sufficiently near to each other to allow the cradles or fingers on the periphery of the first drum to engage with those of the second. The plate from the tinning pot is placed as before on an upright inclined cradle and automatically released at the

proper moment so as to drop into the slow-traveling fingers of the first drum, which seize it across the edges with a claw-like action and drag it edgeways around the bottom of the semicircular bran tub. At half a revolution the claws disengage and those of the second drum, traveling in the opposite direction, carry the plate through the second branning, the upper side of course now being underneath. The distinct advantage of this machine is that the plates are held edgeways throughout and cannot be injured. On the other hand, the fingers require very nice adjustment, and too often foul the plates in the most disastrous way. There are a considerable number in use, but machines requiring such absolute mechanism cannot be considered satisfactory.

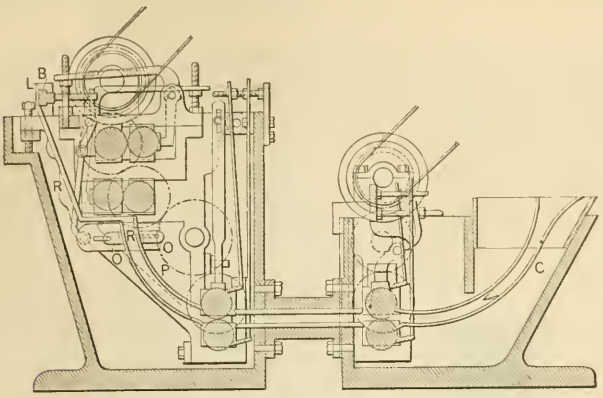

Fig. 40

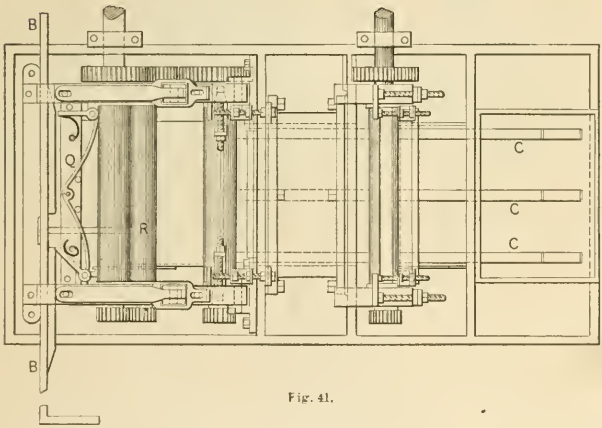

Fig. 41.

THE THOMAS TINNING POT.

The Hopkins Machine.—The claws in Abbott's machine are done away with in that of Hopkins', Figs. 43 and 44, which is otherwise very similar in idea, namely, fingers traveling in a semicircular bran tub, save that the second tub is entirely omitted. In this machine the plate A is placed by the riser in the box B, which has doors, E and F, opened periodically by tappets, C, acting on the lever D, Fig. 44. A drum revolving in bran has four nippers, G, opened and closed at the proper times by the ring cam H, through the rods I. The plate drops at the proper moment into the open clip, is taken through the bran and is released at such an angle as to slide quietly down the table leading to the finishing rollers. These consist of alternate pairs of feed rollers covered with india rubber and sheepskin rollers, the last pair of the latter being cleaned by flying rollers running in the opposite direction.

The Rogers and Player Machine.—Large as is the saving of labor and material in such machines, they have a natura tendency to clean in streaks as the wool rollers wear, and it goes without saying that the best results will be obtained by a machine giving in addition a reciprocating motion. Figs. 45, 46 and 47 give side and end elevations and plan of the Rogers and Player machine, which has such motions. In these figures, C C, &c., are pairs of feed rollers to carry the plate from right to left, and they are driven by the gearing shown in Fig. 46. Upon the frames L L, and parallel to them are mounted pairs of reciprocating frames moving on rollers, M M, and actuated by two pairs of eccentrics on the first motion shaft. The bran troughs B, the dusters D and the brushes C being mounted on the reciprocators, share in the motion, which, as between the upper and lower, should be in opposite directions, and the bran troughs B B are divided horizontally so that the plate passes throughthe descending stream of bran. The upper halves of the troughs have brushes, *n*, on their exit side to prevent an excess of bran being carried off. The lower halves have also brushes inclined at an angle to hold the plates up against the top weight of bran. The three pairs of dusters D are covered with sheepskin, and though free to revolve they have no positive motion except a rhythmical step-by-step motion by ratchets and pawls (not shown), in order to prevent the sheepskin wearing into flats. The bottom dusters move in the same direction as the plates and the top dusters in the opposite direction. The bran escapes from the troughs into the hopper K, and is circulated by the traveler H and elevator F.

The finished plates are delivered on to the table X. The inventors of the machine claim that "the reciprocating motion of the bran troughs and dusters in opposite directions and transverse to the travel of the plates through the machine, while thoroughly cleaning the plates, offers such slight resistance to their passage that the finest gauges are operated on without damage, as there is nothing to interfere with the action of the bran, all the grease is removed before they come to the dusters, and they are finished free from scratches and buckles."

The cost of cleaning and dusting by machine, with an allowance for motive power and interest on $800, is no more than 60 cents per 100 boxes, labor being confined to one man at $2 per day. This, like many other departments, may perhaps be suitably let by contract to a responsible man, who, if he were paid 35 cents per 100 boxes on the output of a four-mill plant, should make a very good thing of it. There is no doubt about the economy effected by machine dusting.

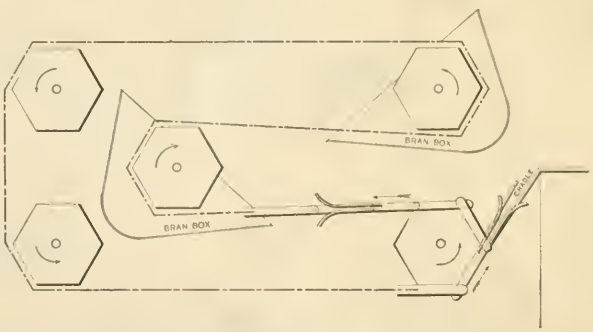

Fig. 42.—THE THOMAS CLEANING AND POLISHING MACHINE.

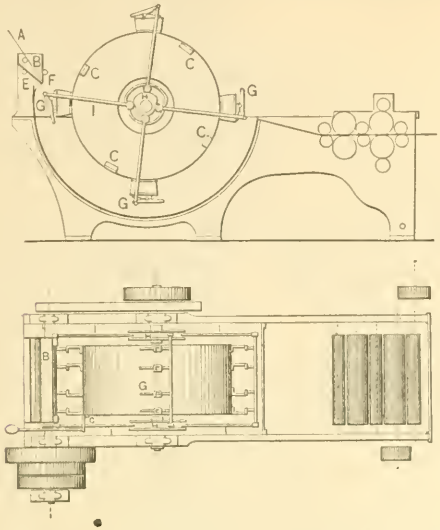
Among recently authorized corporations in Illinois are the following: The United States Stoker & Anti Clinker Grate Bar Company, Chicago; capital stock, $1,000,000; incorporators, Charles E. Bean, Fred. S. Bean, Watson Ryder and Frank W. Blair. Charles Kaestner &

Co., Chicago; capital stock, $300,000; for the manufacture of machinery; incorporators, Charles Kaestner, Robert L. Tatham and Timothy F. Mullen. Chicago Facing Mills, Chicago; capital stock, $50,000; incorporators, Samuel J. Sloan,



Figs 43 and 44.—THE HOPKINS CLEANING MACHINE.

Carroll B. Kinsey and Arthur F. Leslie. The Snow Windmill Company, Batavia; capital stock, $50,000; incorporators, Franklin L. Chase, Joseph W. Eliel and W. C. Hawley. The Caloric Furnace Company, Chicago; capital stock, $500,000; incorporators, Charles K. Pickles, E. J. Stannus and Aug. Borlinghaus. The Dealers' Steel Fence Company, East St. Louis; capital stock, $300,000.

Miscellaneous.

Lying outside the immediate circle of the leading trades, to whose interests *The Metal Worker* is more particularly devoted, are a number of different industries, the products of which are used by those trades, or which are themselves in some way brought into relationship with them. From representatives of these various industries, who we count among the supporters of this journal, we have received reports in relation to their business which will be of interest to many of our readers. It will be noticed by a glance at the following notes that it has been almost uniformly the experience of the different concerns that business has been brisk, but profits either stationary or less in margin, owing to the excessive competition which appears to exist in all lines of manufacture:

ELEVATORS.

Elevator builders in New York, Philadelphia and Chicago apprise us of rather larger business during the last 12 months, but without corresponding profit on sales. The competition in this branch of construction is stated to be very keen, involving so material a reduction of prices as to leave but the minimum of gain to makers. Improvements in action and construction are noted, which bring these appliances up to a very high standard of excellence. The increased adoption of lofty buildings in most of our large cities has called for a larger supply of elevators, and orders steadily grow in volume.

SPEAKING TUBES.

A maker of speaking tubes and electrical supplies, in one of the Eastern States, gives similar testimony to the above as to competition. Although the quality of goods is constantly being improved, and a good and growing demand exists for these specialties, the prices are cut so fine that the margin of profit has been less than in former years, and tends to decrease still further. For volume of business the outlook is considered very good.

PORTABLE FORGES.

An Eastern manufacturer of portable forges speaks of much greater bulk of business, with but the same net profit in dollars and cents as in 1891. He places the shrinkage in gains on individual sales at 10 per cent. The expectation is expressed of doubling his output this year, owing to increased facilities.

NICKEL PLATERS' SUPPLIES.

Increased competition again comes to the fore, in the report of a prominent firm, making a specialty of nickel platers' supplies. The margin of profit is said to have been much less, and, although far more business was taken than in 1891, the net gain was but a trifle larger. The concern in question writes as follows regarding competition in this line of business: "Small houses, without adequate means, and obliged to borrow to meet obligations, sell at a loss, giving a downward tendency to trade. Also the well known fact that some houses pay a commission to purchasing agents, and pay the workmen, makes it harder each year for those who are opposed to such practices." As to prospects for 1893, it is noted that: "From

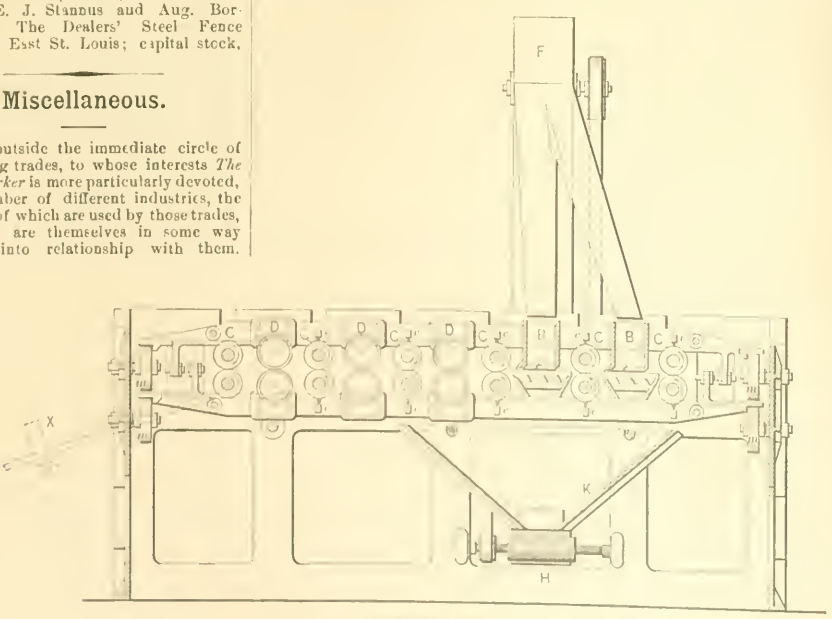


Fig 45. Elevation.

THE ROGERS AND PLAYER CLEANING MACHINE.

reports of customers, and orders received, it does not promise to open as briskly as last year, although trade is continuing to be pretty active up to the end of this year. We have not as many orders as usual for deliveries after January 1." Raw material is reported to have been delivered in a purer and better state, tending to improve manufacture, and decrease in cost has been secured by the adoption of better machinery.

HOLLOW WARE.

Hollow ware manufacturers give an estimate of 10 per cent. increase in total sales, but no corresponding advance in net profits. Prison competition is said to be a leading cause of the drop in prices. Makers of this line of goods are reported as booking orders ahead at little or no profit in order to make sales.

GRAPHITE.

Stress of competition and consequent low prices are experienced also in the line of graphite products. A concern engaged in this business notify us as follows: "We have been obliged to improve our appliances, buy goods cheaper, discount our bills as much as possible and economize in that direction so as not to reduce wages." Volume of business is reported as largely increased during the past year, and prospects are regarded as good for the present year.

MICA.

Manufacturers of mica goods report very largely augmented business for 1892. The cost and scarcity of raw material has, however, caused a contraction of the margin of profit.

PAINTS AND CEMENTS.

From a leading manufacturer of paints and cements, in this State, we receive the following information in regard to his business of last year: "Business in general has been as good as for several previous years, and, although collections have been slow in some sections, the general result has been satisfactory. Competition has been of a more healthy tone than for some years past, as producers and manufacturers find it to their best interests not to sacrifice reputation and quality by competing with houses of mushroom character, whose cry is that they sell the cheapest goods in the market. Buyers, as well as consumers, are looking more closely into qualities, as well as price. My business has been more profitable this year, from two circumstances—viz., increased demand for my goods, and large purchases of material which I was able to make for cash, although my standard of quotations has remained as high as formerly. The prospects for the ensuing year are very flattering." Another firm, engaged in similar business in a neighboring State, apprise us that 1892 yielded to them a larger volume of sales than any year since 1862. They complain, nevertheless, of great and growing competition, with annually increasing expenses, which reduces their profit on sales very much. No improvement is anticipated in these respects during 1893.

VARNISH AND JAPAN.

A concern manufacturing varnish and japan in one of the Western States announces considerably greater trade, but with less profit, owing to sharper competition.

STOVE POLISH.

We hear from Eastern producers of stove polish of 50 per cent. increase in sales, and a steady growth of business during 1892. At the same time competition is stated to have increased 100 per cent., causing a reduction of profit on sales. The outlook in this trade is regarded as bright.

ENAMEL.

From a western iron enamel company news is to hand of 20 per cent. larger volume of business done last year than ever before, with unchanged conditions as regards competition and profit. A tendency to cheapen goods in this line is noted, making it a hard fight to maintain prices and augment sales of staple productions.

Price-Lists, Circulars, &c.

THE ST. JOSEPH PUMP COMPANY, St. Joseph, Mo.: The Perfection Water Elevator and Purifying Pumps. In their catalogue No. 5, 1893 descriptions and illustrations of the Pumps are given, also reasons why dealers should handle the Perfection Pump The aim in presenting the catalogue is not only to acquaint the trade with this style of pump, but to present to the public the facts showing the necessity of using pure water and how to obtain it.

E. C. MEACHAM ARMS COMPANY, St. Louis, Mo.: Catalogue No. 524, to dealers only. Illustrations are shown of Guns, Rifles, loaded Shells, Traps, Hunting Coats, Gun Implements, Bicycles Roller Skates, Tents, Foot Ball Goods, Cartridges, Revolvers, &c.

STOVE TRADE NOTES.

The Stove Trade.

IN ESTIMATING the progress and results of the stove trade during 1892 it can unhesitatingly be said that they have, generally speaking, fully realized the favorable opinion as to its prospects formed at the opening of the year by the majority of stove men, and expressed in *The Metal Worker* at that time.

With the exception of some sections of the South, we have received excellent reports of the volume of business done last year, compared with previous seasons. With one voice Western manufacturers acknowledge having passed through an exceptionally successful campaign. Eastern stove men, with but few exceptions, testify to increased sales and a gratifying growth of business, varying from 5 to 75 per cent. over that of 1891, while expectations are entertained that 1893 will yield results at least equal, if they do not exceed, those of the past year. And, although the majority of reports from Southern stove men do not present as satisfactory a picture of the trade in their neighborhoods as could be desired, yet, even from thence comes intelligence of a decided improvement in general business conditions now setting in, which conveys hope and expectation for something better in the near future. We hear, furthermore, few or no complaints in regard to collections. On the contrary, the evidence received tends to show that in most territories collections have been unusually easy during the year.

Higher Qualities of Goods.

The growing demand for the better class of goods and specialties, as against cheaper articles, is a healthy sign, which gives assurance that the public are becoming alive to the advantages of good workmanship and materials and are willing to pay for them. A correspondent in the West writes to us on this subject to the following effect:

If the stove manufacturer could only be made to realize that his business was more like the coffin business, it would undoubtedly increase his profits. That is to say, like coffins, a stove will not be bought until necessity compels the purchase, and two stoves will never be bought simply because the price is reduced, when only one is wanted.

This, we think, puts the case in a nutshell. If manufacturers, taking hold of the present opportunity, where a large and growing demand for higher grade, and, consequently, higher-priced goods, undoubtedly exists, would take advantage of the conditions and adjust their prices to a profit-paying basis proportionate to the improvement in quality of their productions, a much more healthy and satisfactory condition of things would unquestionably result.

As it is now the makers of high class stoves, who lose no opportunity of improving their goods, find the cost of production seriously augmented by disbursements for new patterns, more expensive trimmings and increased cost of labor, without, in most cases, any corresponding gain in higher prices. The margin of profit is, therefore, worn down almost to the vanishing point. This is a serious consideration with many stove men, and one that will have to be adjusted before long, for all concerns cannot expect to do such an immensely increased volume of business, as is now imperatively necessary if a fair and legitimate percentage of gain on capital invested is to be obtained.

Increase of Business.

A moderate estimate of the average of increase in volume of business and in output from foundries during the past year places the amount at from 10 to 15 per cent., taking the Eastern manufacturers as the standard. Western concerns show a volume which is nearly as much in excess of this figure as that of the Southern trade falls below it. But even taking the lesser amount, which is about on a par with last year's results (and the balance of opinion is that 1892 has decidedly overstepped its predecessor), the trade is to be congratulated upon a good and healthy year's business, which on the whole leaves little or no cause for complaint, except in the South. We do not, however, lose sight of the fact that with the increase of business other factors have kept step, which prevent manufacturers from realizing as satisfactory profits from their sales as was formerly the case. Competition is, if possible, keener than ever, and prices have been in some quarters so reduced as to leave a very small margin of profit to the maker. That margin is being steadily reduced, so that a very considerable and constant augmentation in the volume of sales is necessary to maintain the same net profit as was secured on a much smaller output but a few years ago.

One circumstance has specially helped the stove manufacturer by reducing the cost of production. The very low prices of iron which have ruled for some months enabled those who had been cautious in their purchases of pig metal in the early part of the year to obtain it at a very cheap rate later in the season. This advantage is one which will have tended toward a better showing on the balance sheets of foundries than would otherwise have been the case; but it has been to a certain extent discounted by an increase in the price of labor, as well as some rise in foundry supplies.

The Fall Trade.

The backwardness of the season caused the fall trade to be a good deal later in beginning, but when it did take a start business was extremely brisk. So much so that many foundries East and West were soon entirely sold out, and became unable to fill the orders which crowded in, and which far exceeded their expectations. Orders for forward deliveries, too, were carried a good deal further ahead than usual. Many dealers who had hitherto generally placed them for August, September or October deferred the date of delivery a month or two months later. The orders received by foundries were, as a rule, for smaller lots than heretofore, but these orders were more frequently recurring, showing that dealers were disinclined to carry large stocks, but supplied themselves with only sufficient goods for current demand. This hand to-mouth method of purchasing is becoming more generally adopted in the trade, in spite of the inconvenience it occasions to the manufacturer.

Maintenance of Prices.

Prices have been fairly well maintained, particularly for high-class goods. The cutting has been confined generally to the cheaper lines of stoves, and to those of old pattern, of which the makers were anxious to rid themselves at any figure. But with the larger makers, and for standard goods, prices have been kept firmer, on the whole, than usual. The better understanding between stove makers, nourished by such conferences of stove foundrymen as have taken place in New England and Eastern Pennsylvania, &c., have tended to the steady maintenance of prices by many, especially of the larger manufacturers. This understanding has also mitigated the keenness of competition in more than one quarter, and rendered it less of a "tooth-and-nail" scrimmage, and more of a natural, business-like rivalry.

The "original sin" of the stove man—improvident sales and low prices—is not yet, however, eradicated. Some concerns still have a mania for making sales at any price, without calculating the cost, and these are the "demoralizers" of the trade. The large majority however are, we believe, well impressed with the necessity of maintaining fair prices, and are resolved to do so while giving good work in exchange. Nearly all concerns speak of improvements, of one kind or another, in plant or goods, which have been effected during the year. The enlargement of foundry capacity in growing and thriving works and the addition of new patterns and machinery are necessary conditions to those concerns who would be abreast of the times. There is little "unearned increment" in the stove business now-a-days. The "live" and "bustling" concerns are those which show the best results when books are balanced; and such is evidently the condition under which success is to be obtained in the stove business in common with most other branches of trade in the future.

Prospects.

From several quarters, both East and West, it is reported that stocks now on the customers' hands are less than ever before, and the demand for stoves is steadily increasing. The same appears to be the case pretty generally throughout the country in which building is going on and in prospect. Good business, accordingly, is looked upon as well assured for, at any rate, the earlier portion of the year, but opinions differ materially as to the outlook for the year 1893 in general. Many hold that prospects of changes in fiscal policy of the new Administration will tend to disturb trade generally, and so, more or less directly, affect the stove business. But the balance of opinion—notably in the West and South—inclines to more favorable conclusions. On the whole, it would seem, that indications point to 1893 as likely to be, at least, as prosperous a year for the stove trade as has been the year through which we have just passed, while

for the Southern branch of it there is every prospect of a decided return of prosperity, with the better financial conditions now developing in that quarter. Should 1893 prove to be as good a year for stove men, take them all round, as was 1892, we see as good reason to congratulate the trade on the outlook as we now do on the results achieved in the past year.

The brief summaries of reports and extracts from letters which we present below will give our readers an intelligent idea of the present situation of the stove trade in different sections of the country.

New England.

MAINE.

From the State of Maine we have reports of a larger volume of business done, with unchanged margin of profit. Competition sharp. The outlook for the present year regarded as promising.

CONNECTICUT.

Connecticut manufacturers write of larger sales than in any previous year, notwithstanding increasing competition. Expenses enhanced in order to compass the same business as formerly done. Similar news reaches us from New Hampshire.

MASSACHUSETTS.

From Boston and vicinity come tidings of increased business, variously estimated at from 5 to 25 per cent. Competition stronger than ever, and profits tending to decrease in margin. General improvements have been made in goods and appliances, showing, collectively, a distinct step in advance of last year. An old-established stove foundry company write, under date December 22, as follows: "Our business compares very favorably with last year. We never knew such good prospects. Have sold, up to the present, all the ranges it was possible to put together with our force. In the parlor stove line the warm season operated disadvantageously, leaving more of that stock on hand than usual. But, on the whole, business has been very satisfactory. Wish we could be confident of its continuation." Several young concerns report great encouragement from the year's results.

RHODE ISLAND.

A correspondent states business to October 1 to have been much larger than for some years, but a drop in the fall trade, attributable to the mild season, somewhat discounted the earlier gains. A good year is forecast for 1893.

Middle States.

NEW YORK.

In New York City the stove trade has held its own, and more. Though makers generally do not speak of very large increase of sales, a steady and moderate gain on conservative lines has ruled. Competition has been keen. A year of good business in stoves is looked for in 1893, provided cholera or other unforeseen impediments to general business do not intervene.

From a number of stove manufacturers throughout the state, we learn that the volume of business has increased in nearly every case; although competition is steadily increasing and profits becoming proportionately lower. The increase in sales for the past year is variously estimated at from 5 to 40 per cent. Prospects for this year are regarded as excellent. A leading firm from the northern part of the State advise us as follows: "The heating trade in general has been very satisfactory to the manufacturers this year, and we see no reason for any change in the coming season. Our business has been subjected to a healthy increase every year since we started." The representative of a prominent stove factory in a neighboring city reports business as "25 per cent. greater than in any previous year, although competition was sharper on both prices and terms and margin of profit less. We consider the prospect as good, stock in customers' hands being smaller than usual."

A Hudson River concern tells of trade which was double that of any season for the last seven or eight years, and difficulty in supplying their customers' wants. Business "booming" and competition not felt. Collections are reported as good.

EASTERN PENNSYLVANIA.

From a large number of Philadelphia, Reading and Schuylkill Valley foundries we receive cheerful reports of the condition of the stove trade in that section. Although a few speak of stationary business, the large majority mentioned sales showing a considerable advance on 1891—5, 10 and even 25 per cent gain is specified, the last figures being given by one of the largest concerns in Eastern Pennsylvania. The press of orders toward the close of the year was beyond even the capacity of some of the largest producers. A Philadelphia firm of long standing mention a larger business than in any previous year. Since October 1 they have been, for the first time, behind their orders. The same tale is told by one of the most prominent concerns in the Schuylkill Valley. "Our orders," say they, "were ahead of our capacity; hence we lost some trade that was offered us. Competition did not touch us. Although some parties were offering at cut prices, legitimate business was, on the whole, but little interfered with. Margin of profit is probably a little better than last year, owing to lower prices for iron. Outlook for 1893 is promising, as the trade we visit appear to have cleaned out their stocks pretty well."

Collections are, by some, said to have been a little slower; but, aside from that, business is healthy. Some authorities, however, do not take an altogether favorable view of the outlook. A Philadelphia manufacturer, standing high in the trade, gives it as his opinion that "buying will be done in a very conservative manner, although I do not think prices will be lower. Uncertainty as to legislation will, I presume, keep buyers from anticipating their wants, causing them to purchase only for current needs."

Considerable extensions of facilities have been carried out in various quarters, with general improvement in manufacture.

Southern States.

MARYLAND.

Those of our Baltimore correspondents whose trade is generally confined to their own neighborhood report an unusually gratifying season. Local sales have uniformly exceeded those negotiated for some years past. This is accounted for by the great impetus given to industrial enterprises and municipal improvements in the city during the past year. A large amount of Northern capital has been invested in manufacturing ventures in and around Baltimore, and building operations have been exceptionally active, giving an upward tendency to trade of all kinds. A continuance of this improvement is considered assured during the year now begun.

One of the leading stove companies intimate an increase of one-third in the volume of their business for 1892, with very encouraging prospects before them this year. They add: "From our personal knowledge we do not see that any stove manufacturers have cause for complaint, as we know orders could not be filled, and every foundry seemed to be sold out."

On the other hand, those concerns who trade mainly with the more southerly States are not able to speak of favorable experiences during the past season, although generally hopeful of better results in this year. One of the firms who stand in this position write: "The business for 1892 will be fully 15 per cent. less than that of 1891, and 10 per cent. less than in 1890, owing to the extreme dullness of trade in the South."

SOUTHERN FOUNDRIES.

Business done by Southern stove men in 1892 has been even less than that of the previous year, which was by no means a brilliant one. "Hope springs eternal in the human breast," however; and our reports, although generally of a somber nature as to late achievements, take a much more cheerful view in regard to future prospects. The amelioration of existing conditions is thought to be guaranteed this year by the better state of the cotton market and improved feeling in iron. Recovery from the disastrous effects of wild land speculation in Virginia is taking place, and a much healthier tone prevails generally than has been the case for some time past. The sentiments of stove men as to the outlook in various sections of the South are expressed in the following terms: "We expect one of the best years we have ever had." "We can see a splendid year's business looming up." "Prospects very favorable." "A good year's business promising." "We look for certain increase of trade this year," &c. But even in the South all have not been equally unfortunate, for from one concern we are advised that the volume of orders since November 1 has been so large as almost to counterbalance the slackness of the rest of the year.

TENNESSEE.

Leading manufacturers in the State report generally a shrinkage in the volume of orders during the year, owing to dullness of trade and lack of money. Competition keen for such business as was about, and profit smaller than ever, on account of the necessity of making material concessions to effect sales. More confidence, however, now prevails, and the outlook is favorable.

KENTUCKY.

Stove foundrymen in Kentucky give poor accounts of the trade up to within a month or two of the end of the year. Competition was unusually severe, and improvident sales by some parties had demoralized legitimate business. Things were looking much healthier in this district, however, by last accounts.

Western States.

OHIO.

A "banner year" is announced by one company in Cleveland as the result of last year's sales. The business in December exceeded that of November, which was an unprecedented occurrence. Competition in the cheaper grades of goods is noticed to be greater, but in the higher class it has been less keen.

Competition has been less felt in Cincinnati, as all producers have had as much business as they could manage. The expectation in that city is for a good, healthy business of fair proportions during the year now opening.

Reports of varying tone as to future prospects come in from a round dozen of towns in Ohio. All, however, agree as to the satisfactory nature of last year's business in the stove line. Large estimates of increase are presented: "Double," "105 per cent.," "much larger," "the best year on record," "20," "15" and "10 per cent." are given, the last being the most moderate figure.

MICHIGAN.

From a letter from a correspondent in Detroit, we quote: "Our volume of business this year will show an increase of 10 per cent. Competition has not been as noticeable, I think, or any more so, the past year than in previous years. Prices have been more substantial among our leading manufacturers, and there has not been so much of a tendency to cut them as formerly. In regard to prospects—of course we in the West, and in fact the entire country, depend a good deal upon the crops and their favorable condition. But I do not see anything at the present time to lead us to suspect anything disastrous during the coming year. It may be that this being World's Fair year, business may be a little affected, but I cannot see any good grounds for concluding that this is going to have a bad effect upon general trade. It should, in certain localities, even benefit it."

IOWA.

Iowa stove men tell of good business and flattering prospects in the stove trade, while from Illinois centers we learn of gains in business by various stove foundries, averaging from 5 to 20 per cent., with fair profits on sales and a promising outlook.

INDIANA.

Improved agricultural conditions are stated to have quickened the trade in Indiana, causing a noticeable growth in the volume of orders for stoves and ranges; but a tendency to cut prices has been felt, with consequent reduction of profits. The situation is regarded as favorable for at least normal business in 1893.

WISCONSIN.

Sales fully up to the average of 1891, which was an exceptionally bright year in this district. Competition not excessive and prospects hopeful.

ST. LOUIS, MO.

The makers of a high class of goods in the stove business are said, by an authority in the trade in St. Louis, to have been making from 10 to 15 per cent. more sales during the past season than in any of the previous five or six years. But the volume of business with those turning out cheaper qualities has not increased. Competition has not been so fierce with the former class, although more active than ever among the latter. The writer states that the prospect for increased consumption of stoves was never better than in this year, and he considers that no class of manufacturers has a better opportunity to make money than the stove men, if they will only adjust their prices on a reasonable, profit-insuring basis.

KANSAS CITY.

In Kansas City the latter months of the year made a very good showing, although the first part of 1892 yielded but dull business in that city. Stocks in hand are very light and good prospects ahead.

COLORADO.

One of the pioneer stove companies of the Far West, located in Colorado, forward a report of doubled business last year, with good margin of profit. General conditions of trade encouraging, and every prospect of a further increase in 1893.

Canada.

Very satisfactory returns of the stove trade in Canada come to hand. An increased business, estimated at from 15 to 20 per cent., is recorded, although the farming interests have suffered severely during the year, more or less affecting all branches of trade. Strikes, during the earlier part of the year, had somewhat dulled competition, but it revived latterly, and is described as keen during the last months of 1892. The outlook for the present year in Canada is considered to presage a very fair business.

Hot Air Furnaces.

Furnace manufacturers, even in larger measure than stove makers, appear to have reason to congratulate themselves upon the returns of the past year, if we may judge from the letters of representatives in the trade which have reached us lately. From these reports we gather that sales of furnaces have in most parts of the country developed to an altogether unprecedented extent since the beginning of 1892.

Furnace men with a really good article to dispose of have found their sales remarkably facilitated. They can report, as quite a number of concerns do in fact report, a volume of business for 1892 doubling or even trebling that of any former season. The latest and most improved types of furnaces find ready sale, almost regardless of cost. "The public," we are told, "will have the best to be had in the heating line, and are willing to pay a good price for it." Quite a considerable percentage of sales throughout the country is composed of the larger-sized and higher-priced furnaces, which have been placed in fine residences, churches, schools and other large buildings. This is partially accounted for by the unusually large building operations which have been carried out during the last twelve months; but also, in a measure, by the fact that furnace heating has been adopted in many cases in place of or as an adjunct to stoves, especially in the average dwelling house.

The remarkable growth of so many Western cities during the year has given a healthy impetus to the furnace trade in that direction, and the prospects for the present year are generally considered to be very favorable by Western manufacturers. The World's Fair has induced a good deal of building in Chicago and the middle West; and, although makers look for no great increase of business in the cities and manufacturing towns this season, this is expected to be offset by a much wider distribution among the towns of lesser size. The Southern States in this particular, as in all other branches of trade, have fallen short of expectations during the past year. The depressing financial conditions which have prevailed in that section up to within the last month or two have been unfavorable to building operations or to outlay of any kind which was not absolutely imperative; and the tendency on such sales as have been made has been to give extended credit to purchasers or even to the cut prices which have ruled. Indications exist now, however, of a much better year for furnace men in 1893, the financial condition of the South having greatly improved, and promising to be still better this year.

Competition in the furnace trade has been stronger in the cheaper grades of furnaces, but is less felt by makers of high class goods and specialties, whose prices have been, on the whole, steadily maintained. A good many more or less ephemeral concerns, exploiting new forms of furnaces of a cheap class, have sprung up and died natural deaths during the year, but solid concerns have in all cases advanced prosperously and reports of enlargements of plant to meet the expected increase of business during 1893 come in from all sides.

Many new types of furnace and improvements on old patterns are noted. Makers all round are alive to the necessity of constant progress in the revision of old methods and the adoption of every system which will facilitate manufacture and enable them to put out better goods. The cost of raw material has been less, but that of labor having increased, together with greater expense in the sales department, the margin of profit on individual sales remains about the same as it has been. The largely increased business done, however, which we put down at from 20 to 25 per cent., means a very material balance in favor of the manufacturers for the year 1892 over that recorded for its immediate predecessors.

Gas, Oil and Vapor Stoves.

Our advices from makers of gas and gasoline stoves and heaters show the business done in this line to have been considerably larger than that of any previous year. The use of gas for fuel is becoming yearly more general; and manufacturers of gas stoves and ranges—while finding increased competition yearly—are able, as a rule, to dispose of all the goods they can produce. In some cases during the past year they were unable to fill all their orders.

Constant increase of facilities on the part of concerns engaged in this line of industry are taking place, and improved machinery for turning out the work has been very uniformly adopted; reducing the cost of manufacture, while improving the quality of goods. Progress has been marked along the line of design, utility, convenience and safety; so that the goods put out to-day reflect, in every way, the greatest credit upon their makers.

In oil stoves, trade has been very satisfactory during the year just closed, and considerably in excess of the business done in 1891. Improvements in the details of construction, and better appearance and workmanship, in the various lines of goods, are reported as having enjoyed the attention of all manufacturers of oil stoves and heaters during the year. Quite a long list of new stoves are announced for the coming season, which is confidently expected to be as much better than the last as that was an improvement on its predecessor.

Manufacturers of vapor stoves give us good reports of business done in their line last year. These goods have been improved, owing to greater experience in manufacture, and now present a much better front in quality of material and workmanship, as well as in operative merit. Still a good deal remains to be done to this the latest type of stove before the system is brought to the perfection it will eventually reach. Competition has not yet reached such a pitch in vapor goods as to cramp those makers who are now engaged in the business. Consequently, at present, a fair remuneration can be secured by those who are in the field.

In this line a distinct advance can be chronicled, with good prospects of a brisk and paying business for the present year.

Stove Patterns.

The communications which have reached us from stove pattern makers indicate a larger all round business during the past year, but with considerable activity in competition and smaller margin of profit than ruled formerly. A large concern engaged in this branch of manufacture in the West report "the largest volume of business we ever had," while others note increases of 10 and 15 per cent. over any previous year. Prospects for 1893 are generally regarded as favorable. New lines of stoves and re dressing of old lines are announced as disposed to be taken in hand all round before next season. Stove pattern men consequently look for plenty of work, with possibly a little better prices during the present year.

Stove Repairs.

A slight average increase is reported in 1892 business, by those concerns engaged in the stove repair trade throughout the country. The fall business is stated to have been exceptionally heavy, compensating for a somewhat light spring trade. In this latter respect a better condition of things is looked for in the early months of this year, as more than one concern speak of preparations for greatly augmented business in 1893. Competition is about normal, that is to say, lively, and profits are cut as close as possible.

Stove Miscellany.

Manufacturers of foundry facings, stove linings, nickel work and stove trimmings generally, give us an impression of steady business, with no very startling changes, either for better or worse, during the year which has just closed. On the whole the demand for their productions has been fully up to the average, and perhaps as much as 5 or 6 per cent. above it. Prices have been generally fairly maintained, in spite of close competition both in the metal and brick lines of supply. The undertaking of their own nickel work business by so many large stove manufacturing concerns—and the number is constantly increasing who do this—has curtailed the outside supply of nickel trimmings very materially. The prospects for the coming year are considered by stove foundry supply men to be hopeful for at least as good a business as during the past year.

Traveling Salesmen for 1893.

Supplementing the list of stove travelers for 1893, which was presented in our columns last week, we give the names of salesmen representing the interests of several additional concerns:

Duncan & Masters, proprietors of the Kansas City Stove Works, Kansas City, Mo., will be represented the ensuing year by C. A. Mann, who will travel in Missouri, Kansas, Oklahoma, Indian Territory and Texas; W. Masters, in Kansas, Nebraska and Missouri, and J. A. Duncan, in Colorado, Arizona, New Mexico and Utah.

The Bridge & Beach Mfg. Company of St. Louis, Mo., will make no changes in their staff, and it will therefore remain as for the year 1892. The company, it is evident, do not believe in frequent changes of travelers, as has been the rule of late years in the stove business, but their policy is to educate their salesmen by selecting them from among young men who have grown up with the company, who thoroughly understand their goods and methods and who become identified with them. As being of interest in this connection, however, we give the territory covered by each salesman: Ralph S Buck will cover San Francisco, Cal.; Leroy M. Dyer, Portland, Ore.; L. H. Booch will travel in Western Texas; Hugh McCallon, in Eastern Texas; James R. Henry, in Arkansas; B C. Arand, in Illinois; E. H. Clayton, in Northern Missouri; F. A. Goetz, in Southern Missouri; A. Weiskirch, in Northern Kansas and Nebraska; R. J Guthrie, in Southern Kansas, and E. H. A. Van Sittert, in Iowa.

The interests of the Chicago Stove Works of Chicago, Ill., will be looked after during 1893 by the following salesmen who will cover the cities and States named: P. J. Coppens, in Michigan; J. Y. Horn, in Indiana; R. F. Ingraham, in Illinois; J. W. Roraback, in Wisconsin; F. W. Lucas, in Minnesota and North Dakota; E. S. Kurtz, in Southern Minnesota; W. H. Lautzenheiser, in Northern Iowa; E. S. Ferguson, in Southern Iowa and Missouri; J. B. McKewon, in Northern Nebraska and South Dakota; Thos. F. Harrow, in Southern Nebraska; W. M. Everts, in Kansas; A R. Creigh, in Washington, Oregon, Idaho, Montana and Utah, and F. M. Baird, in Chicago.

The Ringen Stove Company of St. Louis, Mo., will be represented by William S. Ley, who will travel in Ohio, Indiana and Michigan; C. C. Hoppe, in Missouri, Arkansas and Texas; William A. Lockwood, in Kansas, Nebraska, Colorado, Oklahoma and Indian Territory; L. A. Buck, in Minnesota, South Dakota and North Dakota; A. X. Smith, in Iowa; E. G. Spindler, in Montana, Washington, Oregon, Utah, Nevada and Idaho; J. A. Preston, in Florida, and William Straube and J. C. Buckley, in Illinois and Wisconsin.

Terstegge, Gohmann & Co. of Louisville, Ky., will be represented the coming season by James R. Crawford, who will travel in Indiana; Thomas R Bryan, in Western Kentucky and Western Tennessee; W. J. Handley, in Northern Kentucky; Col. E. M. Hooe, in Central Kentucky; E. F. Evan, in Eastern Kentucky; W. H. Lyon, in Southwestern Kentucky; A. J. Terstegge will cover the trade in Louisville; Louis Drautman, in North and South Carolina, Georgia and Eastern Tennessee, and R. E. Finch in the State of Texas.

The interests of the Indiana Stove Works of Evansville, Ind., will be looked after during 1893 by Major J. E. Gorham, who will travel in Texas; Major W. H. Brennecke, in Illinois, Southeastern Missouri, Northern Arkansas and Western Tennessee; Col. F. O. Headly, in Missouri, Kansas and Oklahoma; W. F. Karges, in Iowa, Wisconsin and Minnesota; A. J. Shultz, in Indiana and Kentucky, and E. C. Speck, in Louisville and Mississippi.

The Estate of P. D. Beckwith, Dowagiac, Mich., will be represented on the road during the ensuing year by salesmen who will travel in the territory named: State of Michigan will be covered by John L. Parker; Wisconsin, Minnesota and Dakota by George T. Adams; Missouri, Nebraska and Arkansas by I. N. Beeson; Illinois by R. R. Elliott; Iowa by E. O. Adams; Kansas and Indiana by Charles Starrett; Ohio, Kentucky, Tennessee, Texas, Colorado and the Pacific Coast by H. L. Mosher. O. G. Beach, sales manager, will have general supervision of the territory.

The Stove Trade of Albany and Troy.

Judging from the opinions of experienced men long in the stove business, says our Albany correspondent, the past year has been a profitable one, and there is promise of good business for 1893. There are now in Albany four sizable stove manufactories, as through various misfortunes the Albany Stove Company have not been in operation the past year. The concern is now in the hands of a receiver, pending a petition for voluntary dissolution. Whether, when the property has been sold so that the receipts may be shared among the stockholders, the plant will be put in operation again by the purchasers is a matter of question; some are of the opinion that it will. Before the company's fire, which wiped out the entire plant some time since, after which a new one was erected, the concern had a good line of parlor stoves and ranges, and were doing, it is understood, a very fair business.

A representative of Rathbone, Sard & Co. said to *The Metal Worker* correspondent that business had increased during 1892, the plant here running pretty full during the whole season. The only shutdowns were during the terrific heat of the summer. A part of the time the plant of the company has been in operation up to 9 or 10 o'clock at night in order to supply stoves to customers. Most of the night work was in finishing goods and loading them into the cars. The stove man said that he was not prone to making predictions, but trade is influenced largely by many occurrences, and the company reveal their opinion that the coming season will be a good one when they make arrangements to handle an increased business, and such arrangements have been and are being made. During the year Rathbone, Sard & Co. added a blower to their plant, and have put a new elevator in their warehouse for raising and lowering stoves from the storage department to the shipping room. The elevator is fitted with all the latest safety devices. The company also brought out and placed on the market a long list of new patterns, including cook stoves, ranges and heaters, embodying the modern features and decorated in an artistic style.

The company wil offer a number of new patterns to the trade when the season opens, while a number of attractive advertising novelties are in preparation.

The Perry Stove Company have done an increased business all the year. They have offered a number of new patterns which have become popular. One of the largest features of the company's business is the immense quantities of heating goods which they send all over the world. Their representative told *The Metal Worker* correspondent that in their opinion 1893 holds a good trade in store for the stove men in this section, if general indications are to be relied upon. The company have, as usual, made improvements here and there in their plant during the year, and are able to turn out large numbers of all sorts of heating apparatus. They are now the only company in the city who make oil and gas stoves, and they have sold quantities of them and will have all of the latest patterns to offer for the season of 1893. Superintendent Liddle is constantly making improvements in the oil and gas stove line. During the year past he invented an entirely new gas stove and a burner for oil stoves which has numerous superior features. During the year the company have added extensively to their lines of ranges and heating stoves. Among these may be mentioned the pair which have proven so popular, the World's Argand range and the parlor stove of the same name, both of which were greatly improved for the season. The trade may expect some new goods from them in the near future.

J. Van Wormer & Co. have done a good business and hope to do more next season. Their brand of parlor stoves and other goods are well and favorably known, far and wide. The trade will probably receive some new and attractive goods from them in the future.

According to the report of the Littlefield Stove Company, they have sold all the West Shore ranges they could make during the year. They say business has been better in 1892 than the year before, and the outlook is considered good. They have added another traveling salesman and will during the coming season cover New York and the New England States thoroughly. They are now preparing patterns for three new sizes of the West Shore range. Not only this, but the company expect to largely increase their facilities in the spring. They are now considering the project of building a warehouse on the site south of their present building, part of the land occupied by their range foundry which was destroyed by fire.

The Fuller & Warren Company of Troy get out some very attractive goods, and during the year past have done a large business. They always keep their plant

abreast of the procession in the matter of improvements, and add from time to time such facilities as are called for. They will offer some of their new and attractive goods during the coming season. The prospect seems bright to this progressive concern.

Burdett, Smith & Co. of Troy have had a very good year's trade; in fact, they say better than for a number of years past. Their prospects and the prospect for trade in general are pronounced as looking good for 1893. They see no reason why it should not be as good as 1892, if not better. They have run their foundry eight weeks longer the past season than for the past three years, and hope this year to beat this record. In the spring and summer they expect to have some new goods for the trade. They have kept up with the procession during the year, and are deserving of success.

The Empire Stove Works—Geo. W. Sweet & Co., proprietors—Troy, have made extensive improvements throughout their stove manufactory during the year past. They found that their goods on hand sold well, and they did not therefore get up any new designs. Their best goods are modern and up to the times. Their trade during the year has been excellent. They have done better, in fact, than during any one year of the past five. They have not found it necessary to increase their capacity.

These reports from the stove men in this vicinity show that all are encouraged by the outlook. The industries hereabouts are growing stronger year by year, and are holding their own in the growing competition. No more attractive goods or more new devices in the stove line are turned out in any section than in this, and the manufacturers here are proud of it. The companies have thinking men with ingenuity and advanced ideas, and it is safe to say that the stove finishers in this section will hold their own during the seasons of 1893.

Changed Conditions in the Stove Trade.

By Stove Maker.

For several years the stove trade in the section around about New York has, owing to extraordinary conditions and elements unusually perplexing, been both unsatisfactory and unremunerative. Three or four years ago *The Metal Worker* was weekly filled with letters and articles asking "What can be done to improve the stove business?" Various causes were assigned for the conditions that existed and all sorts of opinions expressed as to the remedy. No real solution of the problem was forthcoming and no remedy every applied, for the reason that trade was undergoing fundamental changes which individual policies were powerless to control. The whole base of the trade was shifting.

At no period in its history have so many changes affecting the interests of the stove business occurred as during the years from 1882 to 1892. Slight changes in all lines of trade are constantly taking place that necessitate departures from established customs of the past, and the stove business is no exception to the rule, but the changes in this branch of industry during the decade referred to have been radical and revolutionary in character, and we find it to-day practically transformed in the *personnel* of its patrons and followers among the retailers from what it was ten years ago, with the channels it formerly followed closed and new ones opened. It needs but a few minutes' reference to old ledgers to substantiate this statement. Retirement from business, failures, death and the natural loss and gain of customers cause great changes in the names found on ledgers that did service ten years apart, but no comparisons for 50 years back will show such conspicuous difference in the names as the ledgers of 1882 and 1892.

It is as though a scourge had swept over the country during this period, carrying off the major portion of the inhabitants, and new concerns had started into being to replace those whose founders had been swallowed up; or one would be apt to received the impression that the ledgers represented different industries, so few names are alike. The reason is that the retail stove trade of the East has broken through its old lines and changed hands almost entirely.

CONDITIONS PREVIOUS TO 1882.

To get at the causes of this great change one must go back of 1882 a few years, for the purpose of examining the business condition of the country and the general policies under which the stove business was formerly conducted. Besides the regular stove and house-furnishing goods stores, a large percentage of the number of stoves distributed in the city of New York in former years was sold by tinsmiths; small jobbers and traders who had small stores for the display of samples, and a tin shop in the rear. From appearances on the surface, one would think they sold a stove about once a year; and wonder how, from the apparently limited business, they managed to keep soul and body together. A look at the cellar of the building, however, would give a different impression, for there, piled to the ceiling on both sides, would be ranges and stoves in all sizes and varieties, with duplicates and sometimes dozens of each. They bought from the wholesalers in July and August, giving their stock orders early so as to have the stoves blacked and piled away. When people wanted stoves they did not think of going anywhere but to stove stores for them and the result was a traffic among them any day of the season with which the activity in a stove store nowadays is like Sunday in comparison. When their stock run low they ordered more and, until the season waned, in quantities to be delivered by the load. When the demand fell off and single stoves only were wanted, they sent their express for them and paid the expressage without a murmur. In fact, the idea of calling on the wholesaler to deliver free a stove or two was one that could hardly originate with any dealer whose sanity there was no reason to question. If plates were found broken after stoves were delivered by the wholesaler in good order and a clean receipt obtained therefor, pieces were ordered and paid for and the stoves repaired, and claims for allowances thereon made only by very unreasonable dealers, a continuance of whose custom would not be sought for or specially desired.

They blacked their own stoves, assumed their own burdens of carrying unsold stock, fathered their own mistakes and generally demeaned themselves in accordance with the recognized principles of business and the established relationship between buyer and seller. They were practical men able to put up a stove, make the pipe and fire board, put on a chimney cap and do anything else necessary to make it work as it should without calling on the wholesaler to send an expert. They bought and sold for cash, and notwithstanding the immense amount of detail and anxiety that belong to the stove business at its best, it was rest to do business with them compared to the perplexities incident to the pursuit of business with the rank and file of the dealers of to-day.

Having thus briefly reviewed some of the old conditions that have suffered most in the changes that have taken place, we will look at the status of general business and the prosperity of the stove trade in years prior to 1882.

THE ZENITH OF PROSPERITY.

The zenith of prosperity in this industry was probably reached in 1872, when returns from money invested in it were large and flattering. In 1873, the year of the panic, a great slump occurred, and the percentage of profit was cut in two, followed in 1874 by a further shrinkage of 50 per cent. in the net amount of the profits of the year before. In 1875 there was a slight rally due only to favorable conditions of weather, and in 1876 there was another tumble, and profits were wiped out altogether. The next year brought no relief except the consolation that things could be no worse and values no lower than they were. The debit side of the profit and loss account still held sway with such concerns whose capital was large enough to keep them afloat, while thousands of weaker ones in all lines went down in the general business wreck. The year of 1878, which may be called the last of the panic series, found the stove manufacturers still struggling for existence. The tide had ceased to ebb, and instead of the great losses of the few years before, their balance sheets showed that they had about held their own, and the crisis had passed.

(To be continued.)

Broken Out Again.

"Curious thing about a stove," observed the exchange editor, as he came in shivering, took off his coat, hung it on its accustomed peg, sat down, examined the points of his shears to see if they could be depended upon in a sudden emergency, and glancing furtively over his shoulder at the financial editor, "curious thing about a stove is that it is always hottest when its coaled."

"Chestnut!—coal," remarked the financial editor, slowly, "is a grate deal more—"

"Now don't get out of your range," interposed the exchange editor."

"If I should," retorted the other, "you couldn't furnace me with any ideas on the subject!"

"But you might get stove up."

"You think you're a pretty large egg, don't you?"

"I don't want any of your slack, anyhow," said the exchange editor, breathing hard.

"If it doesn't soot you," snorted the man of finance, "you can lump it!"

"You needn't get so warm over it!"

"Then don't stir me up."

"I haven't bin stirring you up."

"It's mighty hod if you haven't."

"Such a remark as that coming from a man who is always getting scooped—"

"Or from a man who can't hold a cannel to—"

But here the railroad editor hastily interposed.

"Gentlemen," he said, "not another word, by chim'ney."—*Chicago Tribune.*

Horace K. Tallmage of Buffalo, N. Y., is the patentee of an improved form of furnace construction, a patent for which was granted on November 29. The furnace has a horizontal bottom ring or plate provided with inclined abutments and a dome provided with an inverted conical central portion with horizontal lugs arranged between it and the wall of the dome. The combustion chamber also has a series of upwardly converging flues secured at their upper ends to the conical portion of the dome and at their lower ends to the inclined abutments of the bottom ring. There are also vertical flues arranged in the combustion chamber between the converging flues and secured at their upper ends to the horizontal lugs of the dome and at their lower ends to the horizontal surface of the bottom ring.

The Western Stove Trade.

By Geo. W. Cope.

The columns of *The Metal Worker* have faithfully chronicled the course of events in the stove trade during 1892. Glancing over them, one will be reminded of many things that have happened which are even now of general interest. We see announcements of new enterprises about to be launched on the great ocean of business, some of which were doomed to immediate destruction, while others were blessed with happier destinies and are now enjoying prosperous voyages over untroubled waters. Our accounts of fires and casualties have been pleasantly few, not many concerns having been burned or storm-swept during the year. Financial reverses have been still fewer, which speaks well for the financial outcome of the business of manufacturing stoves, albeit millionaires in the stove trade are as yet unknown. A considerable amount of space has been devoted to reports of improvements in plants, numerous manufacturers having found increased facilities necessary to meet the requirements of their growing trade. Personal mention has not absorbed so much of our space as might be imagined, because *The Metal Worker* is not given to mere gossip, but aims to furnish its readers with information having more than ephemeral interest. Our departed friends have received deserved tributes at our hands, but this service, we assure our readers, we are in no haste to render any of them. One of the most pleasant features of our references to trade the past year was the frequent occasion to note

THE PROSPEROUS CONDITION OF BUSINESS.

The two years preceding had been such busy periods that stove men looked forward with some misgivings to 1892, fearing that it would be almost too much to expect three good years to come in succession. But now that the year has ended, it proves to have been the best of the series. For a portion of the fall the demand for stoves was so heavy that the trade was only limited by the capacity of the foundries, according to the personal testimony of many in the trade who were interviewed on the subject. At the same time other manufacturers of heating apparatus were also highly favored with an active demand for their products. Oil-heating stoves were never before so popular, gas stoves sold very freely, furnacemen were driven almost to distraction by the importunities of their patrons, and the hot-water and steam-heating trade was exceedingly active.

The year was a phenomenal one for the vapor-stove manufacturers. All of them enjoyed the best trade they ever had. This business has been more concentrated in recent years, and is now almost wholly in the hands of those who make a specialty of vapor stoves, or else combine the vapor and gas stove or the vapor and oil stove business. Makers and jobbers of coal stoves have very generally relinquished the vapor stove trade, as they claim, much to their own satisfaction. The progress of the vapor-stove trade is well demonstrated by the statistics of sales published by the Ringen Stove Company of St. Louis, who advanced from 22,290 stoves in 1890 to 36,242 in 1891, and to 54,715 up to the beginning of December, 1892. Other manufacturers state that their trade has also increased remarkably.

The prosperous condition of the country inspires the hope that the new era of activity which has favored the stove manufacturers for three years has not reached its climax. No one will object to the increased work which an enlarged business imposes, and the preparations which have been made or are now in progress for doing a still heavier trade will, we earnestly hope, be found to have been necessary before 1893 has been far spent. It is interesting in this connection to note some of the

IMPROVEMENTS IN PLANT

which have been brought to our attention during the past year:

The Art Stove Company of Detroit, Mich., built a four story and basement brick and stone structure, 50 x 100 feet in size, to be used for offices and salesroom and for storage purposes.

The Columbus Steel Range Company of Columbus, Ohio, removed into a new three-story building, 84 x 108 feet, erected to meet their special requirements and used for offices, salesroom, construction department, pattern making and storage purposes.

Schwab & Sercomb of Milwaukee, Wis., erected an additional building, 40 x 76 feet, four stories high, to be used entirely for manufacturing purposes.

The Farquhar Heating Company, formerly at New Wilmington, Ohio, built a much larger plant at Wireton Park, near Chicago. Their building is 210 feet square, covering a full acre of ground, and is fitted with the most approved machinery, much of it of special design, for the manufacture of the company's specialties.

The Born Steel Range & Mfg. Company of Cleveland, Ohio, removed their city warehouse to a much larger building having five floors, two of which are used as sample and display rooms, one for offices and two for workrooms.

The Collins & Burgie Company erected a new plant at Marengo, McHenry County, Ill., the foundry being 250 x 150 feet, tumbling room 55 x 75 feet, mounting shop 75 x 200 feet, two stories high; engine house 50 x 75 feet, warehouse 100 x 200 feet, two stories high, and pattern house 50 x 100 feet.

The A. J. Lindemann & Hoverson Company of Milwaukee, Wis., put in machinery for the manufacture of gas, gasoline and oil stoves.

W. L. Sharp & Son of Steubenville, Ohio, completed new works to replace those destroyed by fire, the foundry being 72 x 326 feet, mounting shop 30 x 150 feet, two stories; enameling building and ovens 42 x 60 feet, stock and flask building 24 x 120 feet, two stories, and warehouse 50 x 100 feet, three stories.

The Cincinnati Steel Range & Furnace Company of Cincinnati removed to new quarters, the principal building being 26 x 100 feet, four stories, used for sale and ware rooms and office purposes, with the manufacturing department in a separate building, 65 x 65 feet, three stories, having an extension 30 x 65 feet.

S. S. Jewett & Co.'s Chicago branch erected a new warehouse three stories high, containing 86,000 square feet of floor surface and having storage capacity for 14,000 stoves.

The Lexington Foundry Company of Lexington, Ky., rebuilt their stove works which had been burned and purchased the patterns formerly used by the Miami Stove Works of Lawrenceburg, Ind.

The Brand Stove Company of Milwaukee, Wis., erected a five-story building, 102 x 153 feet, to be used for general offices, sample room and storage.

E. Bement & Sons of Lansing, Mich., added a three story building 80 x 120 feet, the first floor to be used as an addition to the molding department and the second and third floors for cleaning and mounting rooms.

Rathbone, Sard & Co. added to their stove works at Aurora, Ill., an extension of 150 feet to their four-story warehouse and mounting shop, increasing their storage capacity about one-half.

Buck's Stove & Range Company of St. Louis added to their molding shop a four-story structure 90 x 130 feet, providing more room for mounting, nickeling and storage.

The Aurora Vapor Stove Company of Cleveland, Ohio, removed to a new factory with much greater capacity than their old one.

The National Vapor Stove & Mfg. Company removed their plant from Cleveland to Lorain, Ohio, where they enjoy largely increased facilities for the production of their specialties.

Intimately connected with improvements in plant are steps taken for

EXTENSIONS OF BUSINESS,

among which we may note the following as events of some importance:

The Detroit Stove Works opened a branch house at Portland, Ore., to meet the requirements of their trade on the Pacific Coast.

The Superior Furnace Company of Little Falls, N. Y., arranged for a full stock of their furnaces to be carried at 84 West Washington street, Chicago.

The Front Rank Steel Furnace Company of St. Louis increased their capital stock from $5000 to $50,000.

The Brand Stove Company of Milwaukee, Wis., established a branch house at 57 Lake street, Chicago, in charge of De Witt Van Evera.

The Highland Foundry Company of Boston Highlands, Mass., established a branch office at 114 and 116 Lake street, Chicago, under the management of Rubel & Co.

The capital stock of the Quick Meal Stove Company of St. Louis was increased to $200,000.

The Ringen Stove Company of St. Louis increased their capital stock to $100,000.

NEW ESTABLISHMENTS

started during the year were not numerous. We have reports of the following:

The Milhuff & Gage Mfg. Company of West Superior, Wis., whose foundry made its first cast January 21.

The Huette-Barler Mfg. Company of Chicago, who began to manufacture oil stoves also in January.

The Steel Stove Company of Des Moines, Iowa, organized to manufacture steel ranges.

W. J. McKay & Co., who established themselves as wholesale dealers in stoves and furnaces in Chicago.

The Sioux City Stove Works, formerly the Daniel E. Paris Stove Company, whose new works at Sioux City, Iowa, were at length put in successful operation with good prospects.

The Minnesota Stove Company were incorporated at Shakopee, Minn., with a capital stock of $50,000.

SOME IMPORTANT CHANGES

occurred in the trade during the year. The Keokuk Stove Works of Keokuk, Iowa, were reorganized and resumed operations on a larger scale, with H. C. Hinskamp, president; L. C. Ingersoll, vice-president, and John W. Hobbs, secretary and treasurer. The Anshutz-Bradbury Company of Pittsburgh organized with W. J. Bradbury, president; Frank Anshutz, vice-president; Lewis A. Anshutz, treasurer; William McCullough, secretary, and L. M. Armor manager of sales department. The Harvest Stove Company of South Pittsburg, Tenn., having failed, the bondholders purchased the plant and changed the name to South Pittsburg Stove Works. The Klein Furnace Company, formerly at Rochester, N. Y., removed to Marion, Ind. The Joseph Bell Stove Company of Wheeling, W. Va., transferred their plant to Muncie, Ind., where they will shortly have their works in full operation under the name of the Joseph Bell Stove & Range Company. Henry C. Burgie retired from

the stove trade after many years of arduous devotion to business, and the management of the Collins & Burgie Company passed under the control of the Greenlee Brothers. W. M. Shaddinger, for several years manager of the Chicago branch of the Detroit Stove Works, was elected secretary of that corporation and removed to Detroit, being succeeded by B. W. Dodson, who united the duties of second vice-president to his function as manager. J. Breton Copp succeeded B. W. Dodson as manager of the Chicago branch of the Michigan Stove Company.

LABOR TROUBLES

were happily few, owing to the excellent understanding between the Molders' Union of North America and the Stove Manufacturers' Defense Association. An important conference was held in Chicago in February between representatives of these two organizations, at which an agreement was made touching all points likely to be in dispute between manufacturers and their employees. April 1 of each year was made the time for adjusting the rate of wages for the next 12 months. Apprentices were to be permitted in the ratio of one to every six journeymen, or one to every seven floors. Mechanical improvements increasing molders' output were to be recognized as due to manufacturers' enterprise and corresponding reductions in molders' wages were to be made so as to net the same per day as before; new molding work was to be done for the same price as old work of a similar character. These items formed the basis of the agreement, full details being provided for carrying them out to the satisfaction of both parties. The recognition of the union was so completely secured that no room was left for complaint by molders on that score. All stove foundries, however, are not operated under this agreement, as all manufacturers do not belong to the Defense Association. Among these some labor difficulties occurred, but they were not serious. We take very great pleasure in alluding to this agreeable condition of affairs, as other branches of manufacturing industry suffered considerably from strikes and lockouts in 1892.

THE DEATH ROLL.

Death reaped an unusually large harvest in the past year among stove manufacturers, beginning on New Year's Day with John M. Brown, treasurer of the Chicago Stove Works. On January 16 Marcus L. Filley died at Lansingburg, N. Y. In February the Baxter Stove Company of Mansfield, Ohio, lost their president, Thomas Baxter, Sr.; Frank H. Gohmann of Terstegge, Gohmann & Co., New Albany, Ind., died, and the Victor Stove Company of Salem, Ohio, suffered the loss of their president, Daniel Koll. In June the president of the National Association of Stove Manufacturers, Jesse Orr of Reading, Pa., died very suddenly, much to the regret of the entire stove trade, who esteemed him highly as a man and recognized his ability as a manufacturer. He was cut down in his prime, with the prospect of many years of usefulness still before him. In the same month also occurred the death of J. H. Roelker, president of the Roelker Stove & Plow Company of Evansville, Ind., a man who had by his own merit and energy advanced himself from the humble position of a stove blackener to the management of a large business. Another man of great prominence, Col. John A. Price of Scranton, Pa., died in August. In him the stove trade lost a student, a scientist and a prolific inventor, a man who left his impress on the times in which he lived. E. D. Seavey of the Seavey Mfg. Company, Chicago, died in September. Alden B. Knapp, superintendent of the Barstow Stove Company, Providence, R. I., died in October, the same month also terminating the earthly career of George W. Floyd, of Floyd, Wells & Co., Royersford, Pa. In December John O'Keefe of St. Louis died. Mr. O'Keefe had been superintendent of the foundry of the Excelsior Mfg. Company for many years. May we have fewer deaths to chronicle the coming year!

THE NATIONAL ASSOCIATION

has not of late played the conspicuous part in stove affairs that it once did. The annual convention was held in Chicago on May 4 and 5, and was quite well attended by members of the trade from all sections of the country. The meeting was a pleasant occasion, and its social features were keenly enjoyed. Opportunity was thus given for manufacturers to meet each other in a less formal way than would otherwise be possible, and to exchange views with one another on practical questions coming up for daily solution. There was a time, not very far back in the history of the association, when it was thought possible, by action through the association, to remedy the ills which occasionally afflict all kinds of trade; but that impression has faded. With it, in the estimation of some, has gone the hope of maintaining a strong association, as they argue that men need a pressing inducement to bring them together. This is not necessarily the case, and we look to see the association continued as a means of annually bringing the trade together for the purpose of comparing notes about business or keeping up acquaintanceship, if for no other purpose. The officers selected to serve until the next annual convention were as follows: Jesse Orr, president; E. W. Peck, first vice-president; George D. Dana, second vice president; Walter S. Stevenson, treasurer; D. M. Thomas, secretary; H. W. Buttorff, Lazard Kahn, J. W. Van Cleave, C. A. Ducharme and W. H. Pfahler, Board of Managers. The death of President Orr has caused the duties of that office to devolve on Vice President Peck. The organization is well manned and in good shape to handle any emergency which may arise calling for prompt action by national representatives of the stove trade.

THE WORLD'S FAIR.

Arrangements are being made to render the space allotted to stove exhibits in the World's Fair as attractive as possible. A large number of stove manufacturers intend to exhibit samples of their goods, and from statements made in a general way the impression is gained that no effort will be spared by leading companies to make a display which will not only be creditable to the stove trade, but will also be an interesting feature of the exposition.

William H. Roelker.

The stove trade of the West will learn with regret of the death of William H. Roelker, which occurred on the afternoon of Friday, December 23, at his residence in Evansville, Ind. He was the son of the late John H. Roelker, and was born in Evansville, January 16, 1857. He began his business career at the age of 18 years, and at the time of his death was a member and vice president of the Roelker Stove & Plow Company. Up to the time his health failed he traveled for the concern through the South and Southwest. In 1884 he was married to Miss Amelia Worth of Quincy, Ill., who, with a daughter seven years of age, survives him. For the past three years Mr. Roelker had been in failing health and a little over a year ago he made a trip to New Mexico, remaining there for six months, since when he had been confined for most of the time to the house. Mr. Roelker was a member of the Business Men's Association, and during the first year of its existence was a member of the Manufacturers' Committee. He was also connected with the Commercial Travelers' Association of Evansville and a member in good standing of La Valette Commandery, Knights Templar, under whose auspices his funeral services were held.

ODD PLATES.

THE WALKER & PRATT MFG. COMPANY of Boston, Mass., have added to their interesting assortment of cook stoves and ranges a very attractive construction known as the Columbia. It is a six-hole range embodying the modern features and is embellished in a style which cannot fail to command the attention of the trade. It is referred to by the manufacturers as possessing more live, practical, sensible selling points than any range in the wide world.

THE CLEVELAND FOUNDRY COMPANY, Cleveland, Ohio, make the interesting announcement to the trade that for the convenience of their New England customers they have opened a branch office and store in Boston at 82 North street, where they will carry a complete line of goods of their manufacture, including oil stoves, gas stoves, warm-air registers, sad irons, &c. The Boston branch house will be in charge of F. A. McMann and E. F. Brainard, who are well known in the New England trade.

IN FRONT of the new plant of the Littlefield Stove Company, Albany, N. Y., is a sodded area, which has been christened "West Shore Park" in honor of the range turned out under that name by the company.

THE DANGLER STOVE & MFG. COMPANY, of Cleveland, Ohio, are giving the gas stove branch of their business special care and have secured as foreman in this department E. C. Warren, who for the past six years was superintendent of the Van Wie Gas Stove Company. The company are at present actively engaged in the preparation of a gas stove catalogue, which it is expected will be ready for distribution to the trade about the 20th of the present month.

JOSEPH ALOIS SUPPIGER of Hirslanden, near Zurich, Switzerland, has recently been granted a patent for a form of stove construction possessing many interesting features. The device makes use of an ordinary lamp for generating the heat, the arrangement of parts being such that this is done, it is claimed, without disagreeable odors.

A STOVE LEG FASTENING forms the basis of a patent lately granted to Louis E. Covert and Charles W. McCutcheon of Peekskill, N. Y. The object of the device is to simplify the process of mounting and handling the legs of stoves. The fastenings may be of any form necessary to perform the work required and for extra heavy stoves or constructions requiring long leg shanks two or more fastenings may be used.

THE PHILLIPS & CLARK STOVE COMPANY of Geneva, N. Y., have shut down their plant, according to custom, and will remain closed about six weeks. The business of the establishment has been splendid during the past year.

THE READING STOVE WORKS of Reading, Pa., are about making some improvements in their establishment by the addition of a 125 horse-power boiler in their No. 1 plant and a 100 horse-power in their No. 2 plant. They are also adding to their sheet-iron department about $3500 worth of new machinery and have purchased a new lathe for the wood pattern shop. In their Millmont plant they are

making some additions, among them being a new No. 7 Baker blower. The trade prospects for the ensuing year are considered favorable and the company will place eight new stoves and ranges on the market during the next few months.

THE MAGEE FURNACE COMPANY, Boston, Mass., whose headquarters in New York have been at 117 Beekman street, have leased the premises at 242 Water street, where during the coming year they will be pleased to see their friends. By those familiar with New York it will be noticed that the new location is but half a block from the old one.

ONE OF THE HANDSOMEST and most artistic calendars which have come to our desk this year is that sent out with the compliments of the Weir Stove Company of Taunton, Mass. In general make-up it resembles the artistic novelties of this character which have been distributed by the company named in previous years. The calendar proper is a long strip of fine-quality paper, carried upon two black enameled wooden rollers, mounted upon heavy cardboard. The rollers work in metallic bearings, and are so placed that the scroll of paper carrying the calendar for the twelve months of the year may be rolled upon the lower rod while it is unwound from the upper rod. The scroll is divided into sections giving to each month a panel of 6½ inches, which, in addition to the days of the week and month, is embellished with a familiar quotation and a quaint design. The printing is done in colors, with artistic effect. Across the heavy cardboard upon which the rollers carrying the calendar are mounted is the word "Glenwood" printed in old gold letters upon a white mottled ground. Down the sides are designs of a floral nature, while across the bottom is the inscription in old gold letters, "Compliments of Weir Stove Company, Taunton, Mass., Designers and Makers of Glenwood Ranges and Heaters." Through the top of the card is a cord of a delicate shade of pink for hanging it upon the wall.

AN IMPROVEMENT in vapor stoves forms the basis of a patent recently granted to Arthur J. Parker and Robert G. Hunter of Williamston, Mich. The various parts are so combined as to provide an auxiliary section of the casing carrying a stove pipe and a damper so made that the section may be inserted or detached at will. When attached the products of combustion may be either directed to the chimney or allowed to pass into the room, as may be preferred. Above the burner is a deflector so placed as to throw the heat against the sides of the stove, after which it takes a circuitous passage to the top of the heater, where it is discharged at a high temperature into the room.

THE MAGEE FURNACE COMPANY of Boston, Mass., have furnished through their branch house at 86 Lake street, Chicago, A. A. Spear, manager, Boston heaters for some of the finest residences in Chicago. Among others may be mentioned the dwelling of A. M. Lynch, 4220 Grand Boulevard; the residence of Dr. J. H. Woolley, Forty-third street; that of J. W. Faxon, 3331 Indiana avenue; as well as those of M. W. Atwood, 4324 Ellis avenue; Dr. T. N. Jameson, 3937 Vincennes avenue, and Dr. A. W. Freeman.

EDMOND RAFTERY, associate manager of Rathbone, Sard & Co. at Chicago, spent "Merry Christmas" in London, England, with his family. He will return from abroad early in the new year.

FLOYD, WELLS & CO., Royersford, Pa., are the assignees of a patent for an oven plate having a corrugated surface, recently granted to Isaac Brooke of Pittston, Pa. To the walls of some of the corrugations are secured plates forming flue which are open at the top and bottom and leaving passages near the top whereby the hot air in the oven may enter the flues and escape therefrom in such a way as to re-enter the oven and cause a circulation of hot air therein. Another flue is so formed as to be open at the bottom and closed at the top. Some of the openings communicate with the exit flue in such a way that some of the air may escape from the oven, thus causing a draft in the latter and permitting fresh air to be drawn in.

THE ECLIPSE STOVE COMPANY of Mansfield, Ohio, state that although their traveling men have not been on the road since last July and the works have been run at their full capacity, they were unable to keep within from four to six weeks of their orders. They have decided to provide adequate facilities for the future and are displacing their present 80 horse-power boiler and 60 horse-power engine with a plant of double the capacity. They have just completed an addition 130 x 135 feet to their molding department and are putting additional machinery in their mounting and nickeling rooms. When the improvements are completed the company expect to be able to ship all goods promptly on receipt of orders.

THE SUPERIOR STOVE COMPANY, Superior, Wis., are distributing a neat advertising novelty in the shape of what appears to be an ordinary firecracker. Upon pulling the fuse a strip of paper is drawn out upon which we find the statement that "This cracker is not made to explode, but to boom our Great Northern Wrought Steel range, which we make in all sizes and styles for coal, coke or wood." There is also reference to the location of the company at the head of Lake Superior and to the fact that their goods are made from Lake Superior charcoal iron. The little device is gotten up by Livermore & Knight of Providence, R. I., who, as our readers will remember, have brought out a great many interesting novelties which have been distributed by the stove and other trades.

THE PRESBREY STOVE LINING COMPANY of 212 Somerset avenue, Taunton, Mass., send us a neat catalogue for the new year embellished with a panel picture and entitled "Favorites." The card carries the name and address of the company across the center, while below is the calendar proper, consisting of 12 sheets printed in black upon white paper. At the left-hand margin of each sheet are given the various phases of the moon for the month. Across the bottom is a line calling attention to any holiday that the month may contain, together with the statement that the World's Fair opens May 1 and closes October 30. A blue silken cord through the top of the card is so arranged that it may be suspended on the wall.

ON CHRISTMAS EVE one of the members of the firm of Rathbone, Sard & Co. received, through their old agent at Belvidere, Ill, John Plane, who was one of the pioneers in introducing Acorn stoves in the West some fifty years ago, a magnificent specimen of a turkey, together with a very pleasant letter, wishing the compliments of the season. As an incident in the business of Mr. Plane's successors, Tompson & Tousley, of Belvidere, Ill., he writes that he wishes to have Gen. John F. Rathbone informed of the fact that a little wood stove bearing his name, and sold by Mr. Plane in 1852, was lately replaced by a Duplex Acorn range, the old stove having been in constant use since it was sold.

G. L. NYE, manager of the Minnesota Stove Company, Shakopee, Minn., was presented by the employees with a Christmas present of a heavy gold seal ring. The presentation speech was made by John Squires. The popular foreman of the works, W. V. Johnson, was also given a handsome fountain pen.

WILLIAM F. SHULZ, formerly of the Albany Stove Company, has connected himself with the office and traveling force of the Littlefield Stove Company, Albany, N. Y.

THE CHICAGO & ERIE STOVE COMPANY, LIMITED, of Erie, Pa., have their Chicago office and salesroom piped for natural gas, and have on exhibition samples of the company's line of patent burners for the fuel named. These burners are in active operation, and are the objects of no little interest to all who visit the salesroom. The burners are made in a variety of styles and sizes, including long burners for basket grates for open stoves or for inserting in fire places; round gas grates for heating stoves; gas grates for ranges, and also what is known as the Miller burner for plumbers' use. These grates and burners, we understand, have been in use for some years past in the natural gas districts of Pennsylvania, Ohio and Indiana, and have given such satisfaction there that the company are in a position to recommend them from actual experience. One of the great advantages obtained in their construction is said to be the fact that should a temporary stoppage in the flow of gas occur from any cause, coal or wood can be used on the burner without disturbing the fittings, or sending for a man to displace the grate.

J. M. LITCHFIELD will continue with the Perry Stove Company during the ensuing year, representing the New York house, 74 Beekman street, on Long Island, and in Brooklyn and nearby cities.

VICE PRESIDENT GRANGE SARD and Superintendent Robert Shaw Oliver of Rathbone, Sard & Co., Albany, recently returned from a Western trip which included Aurora and Chicago, Ill.

J. H. CORT, manufacturer of gas heating and cooking apparatus, also dealer in stoves, ranges, furnaces, &c., 220 and 222 Water street, New York, has admitted his son, Warren L. Cort, as a partner, the style of the firm from January 1, 1893, being J. H. Cort & Son.

J. D. LINCOLN of J. D. & C. C. Lincoln, dealers in stoves, ranges, heaters, &c., at 236 Water street, New York, refers to the season's trade just closed as very satisfactory, and anticipates an increased demand for the ensuing year.

JOHN E. FRENNING, treasurer of the S. M. Howes Company, 40 and 46 Union street, Boston, was married at Cambridge, Mass., on Thursday, December 29, 1892. Mr. Frenning is a young and popular member of the trade, and is receiving many congratulations, to which *The Metal Worker* adds best wishes.

THE AURORA VAPOR STOVE COMPANY of Cleveland, Ohio, are now fully settled in their new factory, which has recently been completed for them in that city. The main structure is 50 x 200 feet in size, two stories in hight, with a wing 50 x 100 feet and two stories and basement in hight. The japanning and paint department, which is a separate building, is 30 x 50 feet, and equipped with the latest improved ovens. The improvements which have been made by the company have increased their manufacturing facilities nearly five-fold and will enable them to promptly serve their customers in the future. The Aurora line of stoves have established a wide reputation, and with the assortment of Aurora Hot Generating and Process stoves which will be on the market the coming season, the manufacturers feel certain that they will be able to give entire satisfaction to all who may patronize them. They also manufacture a

full line of gas stoves and ranges, soldering furnaces, plumbers' pots, oil and gasoline torches, burners, &c. The officers are: Charles A. Pope, president; George M. Clark, vice-president, and A. C. Pope, secretary.

THE DANGLER STOVE & MFG. COMPANY, Cleveland, Ohio, send us a copy of an exceedingly attractive catalogue and price-list which they have issued, relating to gasoline vapor stoves and ranges. It is a publication of 40 pages, neatly printed on good paper and bound in colored-paper covers with a side title embossed in gilt letters. This is the fourteenth annual catalogue which the company have issued, and in it they call special attention to the improved design of the frame for their individual and single-generator burner stoves. The great merit of these goods is claimed to be that they are made with the company's "H.K.D." Excelsior and single-generator burners, which have been in constant use for the past thirteen years. The Dangler Surprise has also been the subject of several important changes after one season's use, and the manufacturers believe that the stove will rapidly come to the front and continue to grow in popularity. The catalogue illustrates cabinet gasoline ranges, gives a sectional view of the burner employed in connection with the Surprise stove, together with general views of individual burner constructions, Junior stoves, ovens, waffle irons, plumbers' and tinners' furnaces, gasoline torches and directions for operating the Dangler Process stove. Another interesting feature of the catalogue is repair lists for various sizes and styles of burners. There is also found a number of pages devoted to gas stoves, including the Surprise, a sheet-iron cylinder construction, and the Dangler, a six-hole gas range of very attractive construction. The catalogue closes with an official price-list adopted by the Vapor Stove Manufacturers' Association of the United States and a telegraphic code for gasoline stoves, ovens, &c.

THE MICHIGAN STOVE COMPANY are furnishing their customers with unique posters for store use. They are made of ordinary manila wrapping paper, printed in imitation of lettering with a marking brush. The language used is pointed and vigorous. One says: "Are *you* going to buy a new stove? The Garland is the world's best." Another reads: "A new arrival of the celebrated Garland stoves and ranges." A third remarks: "Step in and examine our new line of Garland stoves and ranges." A fourth announces: "Just received—a new line of the celebrated Garland stoves and ranges." Every sheet bears the well-known Garland trade-mark. If these sheets are hung in a merchant's window for a while or tacked to boards outside the door, they will undoubtedly attract more attention than an ordinary printed poster in conventional type, as they have the appearance of having been done by hand.

House-Furnishing Goods.

The term "house-furnishing goods" covers a wide field; and the reports of our correspondents which are classed under that heading will give a very good clew to the condition of general trade throughout the country. Nothing should be so good an index of the well-being and prosperity of the community at large as the demand for household goods. Money spent to a large extent in the articles which come under that name, shows that money is abundant and well distributed. We are pleased, therefore, to see that, in almost every line of house-furnishing supplies, the reports which have come to hand testify to more or less flourishing business having been experienced during the year. A few extracts from reports will give a better general idea of the state of this trade than it would be possible to do in a summary, on account of the variety of goods treated.

ENAMELED AND TIN WARE, ETC.

A home firm importing and manufacturing enameled ware writes of a business which has doubled in the past year. Competition in this line is keener, and a great deal of poor quality goods are put on the market to compete with the better grades. In regard to prospects, the writers consider the outlook for business as good. They add: "Our goods are bulky, and dealers are forced to order small lots and often. They cannot be overstocked. Those who have looked for prices first and quality afterward have had so many complaints and lost so many customers that they have concluded it better policy to sell prime-quality goods."

From a new England concern making granite and agate ware as well as tin and Britannia ware, we learn of increased business at slightly smaller margin of profit, owing to more active competition, with a tendency to lower prices, and a cheapening of the class of goods marketed. The certainty of at least a fair business in the new year is expressed.

HARDWARE SPECIALTIES.

Trade generally good throughout the Eastern and Western States. A prominent concern in the East making specialties in hardware house-furnishing goods report 10 to 12 per cent. increase in volume of business, but smaller profit proportionately than in 1891. An excellent business is predicted for 1893.

From a Western house engaged in the same line of manufacture we receive the following report:

"We have during the past ten years made a yearly gain in gross sales of about 10 per cent., in spite of the fact that in that time prices have grown very much lower. We should have made a better showing this year but for the failure of the cabbage crop, which caused us to sell less cutters than during any previous year. Cost of manufacture is rather less, but prices being also lower makes the margin of profit about equal. We think the prospect good if the World's Fair does not affect business."

From a wholesale tinware house in Indiana, we are told of growing business, with no drop in the margin of profits. The outlook is thought to be better for business this year, than in any preceding it.

WASHING MACHINES.

A 25 per cent. increase is expected in the business in washing machines, for which a growing demand is noticed.

HOUSEHOLD UTENSILS.

Business in pails, wash basins, cuspidors and other household utensils is reported as better than before experienced. Sharper competition and lower prices are stated to rule in the Western States, where dealers are buying cautiously.

ICE CREAM FREEZERS.

Freezers have had a good year, we are told by more than one maker of these utensils in the East. The export trade in ice cream freezers is said to reach a very much higher figure this last season than usual. Severe competition and consequent close prices obviate, however, any large margin of profit.

Twenty five to 30 per cent. is given as the gains in volume of business last year.

REFLECTORS.

A manufacturer who makes a specialty of reflectors states that he has found business much better than any other year. He complains of irresponsible competition and low prices, reducing profits to a minimum.

TRADE REPORT.

The Outlook in the Iron Market.

VERY little need be said concerning developments in the Iron and Steel markets during the past week. There have been very few transactions of magnitude to test the market in any line or in any leading distributing center.

The consensus of opinion, so far as the coming year is concerned, seems to be that for many months to come nothing but a low range of values can be expected. The Iron and allied trades are expected to share largely in the general quickening of commerce which is likely to develop in certain directions as one of the effects of the World's Fair. Conservative business men are nervous, however, concerning the possibility of an invasion of cholera. Another question which is beginning to come forward as a possible disturbing factor is the danger of a premium on gold.

So far as the Iron trade proper is concerned, the principal argument for a continuance of low prices is based on the prediction that Lake Ores will be very cheap this year. First of all, it is undoubtedly true that considerable quantities of Ore now on the docks at lower lake ports remain unsold. That is conceded by the mining interests themselves. The point is made, however, that relatively little Bessemer Ore is unsold on the docks. If this be true, then there is sure to be a pressure on the non-Bessemer varieties, which will react on Gray Forge Pig and crowd down Muck Bar, thus helping the puddling furnace in its struggle with the Bessemer converter.

The principal cause for the cheapening of Bessemer Lake Ore for the coming year must be sought in the invasion of the markets by the product of the Mesaba range. These new Ores must fight their way into favor. For the present they can be very cheaply mined, and it is intimated that $3.75 at Cleveland is expected to be the selling price. This may crowd a good many of the weaker miners in the older ranges to the wall, but even then the market is likely to be heavily supplied. The most conservative estimates of the 1893 Mesaba Ore product place it at 750,000 tons, this figure being based rather on the probability of inadequate transportation facilities than upon the producing capacity of the mines.

Should developments in the Lake Ore markets take this course, which can be interfered with only by labor disturbances, then the producers west of the Allegheny Mountains will possess a tremendous advantage. They are likely to become fiercer competitors than ever before in Eastern markets in all Soft Steel products. They will probably crowd the Southern Pig Iron makers back from markets which they have thus far invaded. The Southern producers may then be expected to put even greater pressure upon the markets east of the Allegheny Mountains.

Relief can apparently come only through a continuance of the enormous consumption of this country, encouraged by low values. It is in this direction that prospects are brightest. Comparatively little increase is expected from the Steel Rail trade, since financial matters are not in such shape as to encourage much construction of new mileage. But the outlook in engineering construction, in architectural work and in the general trade is regarded as excellent.

The Eastern Iron Trade in 1892.

As the controlling Eastern market, the following review of the trade in Philadelphia and Eastern and Central Pennsylvania closely reflects conditions prevailing during 1892:

Pig Iron.—There is not much room for comment in regard to prices during the year just closed, as they were uniformly low, the extreme point of depression being reached during the months of July, August and September. Prices opened in January, 1892, at about $1.50 to $2 better than could be realized during the month just closed, and from $2 to $3 better than was obtainable during the summer months. December, 1890, showed the weekly output to be the largest on record up to that time. Production kept on increasing during the three following months, reaching in March the enormous aggregate of 194,000 tons. This, as might be expected, was the last straw that broke the camel's back, and from that date on until October there was a very rapid curtailment, a difference in fact within six months of about 42,000 tons per week. From the course of the market during the past year it may be inferred that 190,000 tons per week is more than the market will take and that 160,000 tons is below its requirements, so that if consumption during the next six months averages about the same as during 1892 the present average output of 175,000 per week ought to keep prices pretty steady. The decline in prices was simultaneous with the increase of production beyond 180,000 tons, the recovery was also simultaneous with the decrease in production below 160,000 tons. That is to say, prices begin to weaken when production is over 180,000 tons, and begin to stiffen when it gets below 160,000 tons. It is therefore fair to presume that our normal consumption will average about 175,000 tons per week. Any material falling off from that tonnage will be likely to affect prices unfavorably, and on the same basis, any marked increase in consumption will also be likely to influence them in the opposite direction. The monthly reports of furnaces in blast ought therefore to be a fairly correct indication of the course of the market from time to time. From present appearances there is nothing to suggest any material departure from the conditions recently prevailing. The Steel Rail trade is liable to become a factor of some importance, but that interest has been dormant so long that the trade almost entirely ignore it. All the same, some of these days it will surprise people when they least expect it. Meanwhile many important changes are being worked out. Steel is usurping Iron to such an extent that the demand for Gray Forge is almost a thing of the past. A few local furnaces, with one or two in Virginia, virtually supply all the first-class Mill Irons that are called for in eastern Pennsylvania, while the foundry trade, which is rapidly extending, absorbs Iron from all parts of the country. Some local brands still retain their former high reputation, but they no longer have a monopoly. Western Pennsylvania (to some extent Ohio), Alabama and Virginia are all contributors to this market, and are supposed to be here permanently. Some of these brands from a distance find a market because of their superior quality, others because of their low prices, each particular brand having become fairly well known for its distinguishing feature, either in price or quality. In regard to prices during the coming year, it is hardly possible to form any very decided opinion, except that they are likely to rule very low. There is some prospect of a lower cost of production, apart from which we should be rather inclined to expect a slight improvement, but under present conditions it will require a good deal of heavy buying to impart either strength or vigor to the market. In any case, matters are in such a shape that consumers have no fears of being taken unawares, and this, in fact, is one reason why there is so little variation in prices. There is not enough concerted buying to put prices up, but, on the other hand, consumers are so dependent on the frequent renewal of their purchases that they have no chance to go down. The extreme limits of quotations have, as we said before, been about 50¢ below the figures of to-day, and at the highest from $1 to $2 above them, as shown by the following, which were current quotations in Philadelphia at the beginning of each month in the year:

1892.	Standard Pennsylvania. No. 1x.	Standard Pennsylvania. No. 2x.	Standard Virginia. No. 2x.
January	$17 50	$16.00	$15.00
February	17.50	16.50	16.00
March	17.25	15 75	15.00
April	15.50	15.00	14.50
May	16 50	15.00	14 50
June	15.75	14.75	14.00
July	15.00	14 00	14.00
August	15.00	14.00	13.75
September	15.00	14.00	13.75
October	15.00	14.25	14.00
November	15.25	14.50	14.00
December	15.25	14.50	14.00

Steel Slabs and Billets.—Some rather wild fluctuations have been met with in this department. Prices opened steady in January at about $27, which was maintained with slight variations until early in February, when a decided feeling of weakness began to manifest itself. This continued almost without a single reaction until July, at which time the complicated appearance of the labor question began to attract attention. Meanwhile prices had reached $24.50 for deliveries to points equivalent to Philadelphia, and it is believed that $24, or very close to it, was done in some instances. During August spot lots began to be at a premium and so continued until about the middle of November, after which date business gradually assumed its normal condition. During the fall months prices ranged from $25.50 @ $27, price being graded according to the necessity of the consumer and the condition of the seller's order book. There was no uniformity in prices, each transaction being a law unto itself. To-day's prices are to some extent of the same character. Sellers ask $24.25 @ $24.50, but buyers are unresponsive, and, while it is hardly possible that there can be any appreciable decline from these figures, it is believed that business will not start up to any extent until makers are willing to quote about $24. A few days will test the matter, but in the meanwhile it is understood that bids at that figure can be had for moderate sized lots for delivery during January and February; beyond that buyers are disposed to hold off. A few odd lots have been picked up at a trifle less than $24, but for the time being that is probably a minimum quotation.

Sheets.—A large business has been done in Sheets, and if the mills had full justice shown them a much larger business would have been done. The manufacture of Tin Plates ought to have absorbed 100,000 tons of Thin Sheets, but imports have been so large that Sheet manufacturers have not had anything near the proportion of business they ought to have had. Nevertheless, mills have been almost continuously full of work, and if there is no tariff tinkering they are likely to do still better during the year upon which we have just entered. Prices have not varied to any extent, but are to-day very close to the lowest on record.

The Western Iron Trade.

The influences of the course of events in the West are clearly set forth in the following review of the markets in Chicago:

The year just ended has been more than usually eventful. It opened with excellent prospects in almost every branch of the Iron trade. General prosperity prevailed throughout the West and Northwest. Agriculture, the basis of all business, had recovered from its depression of years and farmers were again most liberal buyers of all classes of manufactured products. Transportation lines were crowded with freight and stockholders looked forward to dividends with old time confidence. Industrial activity was quickened in every direction. Building projects were numerous in every city and town. Capital promised to embark in new enterprises with much less timidity than for the previous two years. The consumption of Iron and Steel was therefore expected to increase considerably, and as a matter of course, a more profitable business was anticipated by Iron and Steel manufacturers. Preparations for the World's Fair in Chicago were also to be pushed vigorously in 1892, and this was looked upon as a decided assistance to general trade. With millions to be expended on the fair grounds, millions more in local preparations outside the grounds, and millions more in providing greater transportation facilities, the effect of the coming fair, it was thought, would be very favorable for all classes of trade in the Northwest.

But adverse influences possessed sufficient strength to overcome these favorable conditions. Chief among these, it is believed, is not only the almost complete cessation of the investments of foreign capital in American enterprises, but also the withdrawal of a considerable portion of that already invested. The change from a long-continued stream of foreign capital pouring this way to a steady drain is a discouraging reversal of commercial conditions. Fortunately it came at a favorable time, or the consequences to this country must have been serious, as indeed may yet be the case if it continues for any considerable period.

The bright prospect with which 1892 was ushered in did not continue beyond the month of January. Values were determinedly seeking a lower level. The course of affairs was from bad to worse as spring opened. Crude iron and steel fell to lower and lower levels, and diminished production failed to check the decline, as the decrease in consumption outran the falling off in production.

Midsummer found the lowest prices prevailing in the Chicago market that had ever been known there, except for steel rails and common bar iron, but the decline was checked by the stoppage of the Western rolling mills and steel works in July and August, pending a settlement of the wages question.

The improvement in the Iron and Steel trades, which was stimulated by the long stoppage of the mills, continued until the middle of November notwithstanding the shadow of the Presidential election. Manufacturers smiled to think that they had ever regarded a Presidential election as a disturbing influence and the remark was often heard: "If this is a sample of Presidential election year business we would like to have an election every year." After the election they felt otherwise. The demand fell off and prices receded until the condition of trade resembled that of the spring. December was a month of general quiet in trade circles.

Pig Iron. January was a month of such activity in Coke Iron that strong hopes were entertained of an improvement in prices. This led to efforts by consumers to place contracts for long deliveries, in which they found local producers willing to join. Sellers of Southern brands were not permitted by their companies to sell so far ahead, and they consequently failed to get as much business as they would otherwise have probably secured. February was inclined to quietness, and March became exceedingly so. Special efforts were made this month by some of the local producers to force trade, and transactions occurred in No. 2 Foundry at the unprecedentedly low rate of $12.50, which was, however, so exceptional that sellers could not be induced to repeat the performance.

April witnessed some improvement in the demand for Coke Iron, and trade was quite active in May, tapering off again in June. During this quarter of the year Southern companies pushed for business more aggressively, and very low prices were made on some transactions, No. 2 Soft receding to $12.50, which was low water mark for the year.

July was comparatively quiet, August was dull until toward the close of the month, when active buying was renewed, and September was a month of very heavy trade. Southern makers surrendered to consumers during this quarter and numerous large transactions occurred at prices which were close to the lowest of the year. Prospects grew brighter for manufacturers toward the close of the month. Consumption was perceived to be very rapidly increasing, stocks at furnaces were known to be diminishing. The foundries around Chicago and through the Northwest were never busier than now.

October was a very attractive month, perhaps surpassing every other month in the year, and November started out equally well, but trade dropped off quite abruptly after the second week, and did not recover even in December.

The following table shows the course of prices at Chicago for the leading varieties of Pig Iron, based on cash payments and averaged for the month on weekly quotations:

Months.	Local coke No. 1.	Ohio strong soft No. 1.	Southern coke, No. 1.
January	$15.25	$17.75	$15.75
February	15 00	17.75	15.75
March	14.50	17.50	15.50
April	14.75	17.00	15.25
May	14.50	16.75	15 50
June	14.50	16.50	15.00
July	14.50	16.25	14.75
August	14.50	16.25	14.50
September	14.50	16.25	14.50
October	14.25	16.25	14.75
November	13.75	16.25	14.75
December	13.75	16.25	14.75
Av'ge for year	$14.50	$16.75	$15.00
Av'ge for 1891	15.50	18.00	16.00
Av'ge for 1890	17.50	20.00	17.25
Av'ge for 1889	16.75	18.75	16.75

Finished Iron and Steel.—If it were possible to obtain statistics of the total quantity of Finished Iron and Steel marketed in Chicago and its immediate vicinity in 1892, it is believed that the figures would be greatly in excess of any previous year. Season contracts by the agricultural implement works which were placed early in the summer ran far ahead of previous years. Other manufacturing interests intimately connected with agriculture were also heavier consumers of Iron and Steel than at any former period. Thousand of tons were used in elevated railway construction. Requirements for the World's Fair buildings were large. The consumption by car works and manufacturers of railway supplies was heavier than usual. The building trades were very active, more Iron and Steel structures having been erected in 1892 than in any former year. Yet prices for the 12 months averaged lower than ever before, and in some cases very much lower. Steel made further inroads upon the domain of Iron. Agricultural Implement manufacturers purchased Soft Steel in notable instances at lower prices than they had previously been able to secure on Iron. Bar Iron prices were lowest in May, having steadily declined from January. They stiffened

up in June, influenced by the prospects of a general stoppage of the mills in July. During the three following months there was great scarcity, and prices advanced still further, being well maintained until December, when concessions were made by mills running short of orders. Bar Iron jobbers in the Northwest enjoyed a phenomenally large business while the mills were closed down and for some time afterward. Large consumers, who usually buy direct from the mills, were forced to draw on jobbers' stocks and paid dearly for their failure to anticipate the stoppage of the mills and lay in supplies.

The Chicago market is now coming more closely under local influences than a year since. At that time the bar mills in the immediate vicinity were shut down, to all appearances permanently. Now they are in active operation, or will be in a few days, and besides new mills have been started in Indiana within a reasonable distance, so that they can easily reach the Chicago market. Sheet mills have also been built within the Chicago district during the past year, and competition is stronger in the Light Sheet trade.

Average prices for 1892 were lower than for many years, perhaps lower than ever before, although they ran up to a fairly high point in August and September, when the influence of the lockout was most felt. The following table shows the course of prices on mill lots, Chicago delivery, averaged from weekly quotations:

Months.	Common bar iron. Cents.	No. 27 common sheets. Cents.
January	1.65	2.90
February	1.67½	2.90
March	1.62½	2.85
April	1.57½	2.85
May	1.52½	2.75
June	1.55	2.80
July	1.62½	2.90
August	1.65	2.95
September	1.65	2.90
October	1.62½	2.95
November	1.62½	3.00
December	1.62½	2.95
Average for year	1.62½	2.90
Average for 1891	1.70	2.95
Average for 1890	1.82	3.17
Average for 1889	1.68	3.21

The Metal Trade in 1892.

Copper.—The year 1892 was one of considerable fluctuations in the Copper trade, a considerable part of the year being influenced by uncertainties as to the character of the understanding among the leading American producers and some of the principal mining companies represented in Europe of other principal producing countries throughout the world. For some years past a few of the giants in the Copper trade have been pursuing the policy of attempting to outdo one another and to crush the smaller companies. This has led to prices which at times have been very close to the cost of production of the average mine. The consumption also has fluctuated within apparently wide limits, and has thus added a further element to the uncertainties of the market.

The year was entered with Copper showing a rising tendency, advancing early in January from 10¾¢ to 11¢ ₱ lb for Lake Superior Copper as the results of large purchases by consumers for delivery over the first quarter. In some cases the contracts covered the first five months of the year. As is usual, the market was flat and lifeless after the majority of the leading Brass and Sheet Copper manufacturers and Wire drawers had bought, and in view of further supplies forthcoming the price was not maintained at the highest figure reached in the advance. The absence of an important export movement contributed to the easing tendency, which continued until the middle of February, when prices had fallen to 10.65¢. Then further contracts with consumers on the basis of about 10.50¢ @ 10.75¢ cleared the market of its surplus. At the same time large sales for export of Matte, involving about 10,000 tons, over six months' delivery, and transactions covering 4000 tons of Ingot for export, aided the situation.

It was a little later, early in March, that rumors began to obtain credence concerning negotiations pending between the leading American and foreign producers. These and the absence of any pressing supplies enabled producers to mark up prices from 10.75¢ to 11.50¢, and further export sales of Matte led to a rising of values up to 12¢. This remained the nominal quotation during the balance of March and the greater part of April and of May. During all this time consumers, having fully covered their requirements, maintained an absolutely indifferent attitude and there were periods in April when small quantities were offered by second hands at a shade under the sellers' quotation of 12¢.

Negotiations among the producers on both sides of the Atlantic were continued throughout these months, the delay encouraging buyers in the conviction that a final arrangement might not be reached. This feeling appears to have been shared by some of the smaller outside companies, who in June began offering supplies at lower figures. Simultaneously the opportunity was seized by bankers to dispose of upward of 6,000,000 or 8,000,000 lb of Copper still held as the balance of material carried over from the time when the French syndicate was operating.

June brought some specific information concerning the arrangement entered into through the international agreement. It was understood that nine of the principal American companies, including the Calumet & Hecla, Tamarack, Osceola & Quincy, on Lake Superior, Anaconda and Boston & Montana, in Montana, the Phelps-Dodge interests and the Old Dominion, in Arizona, had agreed not to produce more than 100,893 gross tons of fine Copper during the year ending July 1, 1892, as compared with an output of 90,625 tons during the preceding year. It was understood that the outside American producers represented a total output of about 36,160 gross tons. At the same time the American producers made the concession to foreign mine owners that their exports should not average more than 3333 gross tons per month. On the other hand, European mining companies, representing undertakings in Spain, Germany, the Cape, Australia, Mexico and Venezuela, bound themselves to reduce their output from 5 % to 10 %. It was reported that these associated companies represented about one half of the total production of the world outside of the United States.

Consumers having been pretty well supplied by bankers' stocks and through other sources kept aloof from the market, which early in July declined to 11.25¢. In the middle of that month the cheap Copper had been pretty well absorbed and prices were marked up to 11.75¢, at which figure they were kept during the greater part of July. Slow sales, however, induced a decline to 11.50¢, a figure which ruled with some irregularity during early September, but could not be upheld. The determination of manufacturers to withhold from the market was the feature until early in October, when somewhat more liberal orders were placed at 11½¢. Then manufacturers entered the market for larger quantities, causing an advance up to 11.50¢. This movement was helped by the announcement that the Anaconda Company would close down their works early in November. Although the impression prevailed that this shutdown was not entirely voluntary and though it was evident that it was utilized for speculative purposes in the English market, consumers become uneasy and the price was rushed up to 11.75¢.

In the first half of November manufacturers bought quite heavily for December and January deliveries, and at the same time a considerable export movement in Ingots and in Matte was attained. This advanced the price to 12¢ and was followed by a very large sale of Lake Copper for electric purposes for delivery during the first half of 1893 at the reported price of 12.50¢. As usual, the struggle between buyers and sellers after culminating in large transactions led to a prolonged period of inactivity, which characterized the whole month of December and promises to be the feature during the early weeks of the current year.

Tin.—During the whole year under review this metal has been juggled with by a set of speculators operating both in this and in the London market. At times prices have been rushed up to squeeze outsiders who have attempted short sales and at other times the market has been artificially depressed in order to punish operators working in the other direction. A feature of the trade, particularly in the earlier months of the year, was the keen competition among importers, which manifested itself chiefly in making special prices for out-of-town customers. The whole course of events has been exceedingly puzzling to consumers and to jobbers, and matters have been complicated by the expectation during the summer that prices would advance in anticipation of the imposition of a duty on Tin under the McKinley law on July 1, 1893.

Tin declined from 19.85¢ for large quantities for spot early in January to 19.50¢ in the middle of February. March developed a more active speculative movement, culminating in prices rising to 20¢ at the close of the month. It was in April, however, that the argument coupled with the Tariff law began to have its first effect in the form of a rise to 20.75¢. The early weeks of May witnessed a very heavy speculative movement, leaving at the end of the month the bull clique in full control, with the price up as high as 21.50¢. The cornering of a short interest in London is supposed to have been the principal cause of a continued rise during early June for Straits Tin to 22.20¢ for large lots. Then came a drop, coupled with a complete standstill of purchases on the part of the trade and of jobbers.

The whole of the rest of the year was characterized by the fact that the speculative element alluded to was in absolute control of the market, at times running up the price and at other times letting it down. These fluctuations up to early November were between 20.15¢ and 21.15¢.

The result of the election threw doubt upon the enforcement of the Tin clause of the tariff bill, and brought about a decline to 19.50¢ in December. Some relief has been sought since then by shipments of stock to England, and by the diversion of metal afloat for America to the London market. Throughout the greater part of the year the supplies were ample, so far as ordinary consumptive requirements demand. It was estimated that at one time the speculative clique was carrying fully 3500 tons of Tin in this country, and was supposed to control the greater part of the metal in Europe.

Lead.—In spite of influences which should have aided the metal, Lead has throughout the year developed an almost persistent declining tendency. The year opened with a continuance of a contest of endurance between producers and consumers, which culminated in the middle of January with considerable sales at 4.10¢, one of the depressing influences being the possibility of foreign Lead being landed in seaboard markets. Buyers did not again reappear until the middle of February, when they

took round blocks at 4.05¢ @ 4.10¢. Then a somewhat stronger undertone carried the market along until March, when consumers were again able to place larger orders at 4.10¢. In April, under good sales, the market improved until 4 27½¢ was reached, at which figure additional sales were made in May.

It was at this time that the labor troubles began in the Cœur d'Alène region, Idaho, a district which furnishes by far the largest quantity of Lead Ores in the country. In spite of this curtailment of supplies of raw material, the market continued weak during June, July and August, falling as low as 4¢. In anticipation of a good fall business producers assumed a firmer attitude and were able to carry the market back in September to 4.15¢. From this price the decline was almost uninterrupted until 3.70¢ was reached in December. Since then there has been a slight recovery, the year closing with the market steady at 3.85¢.

Spelter. — Under the weight of an enormous production on the part of American Spelter makers the markets throughout the country have weakened during the greater part of the year. Prices started at 4.65¢ and were only fairly maintained during the first four months by repeated export sales, the prices made by the European syndicate of producers making it possible to market Spelter abroad. August brought a somewhat better tone, which was aided in September by the fact that floods in the Missouri and Kansas mines curtailed heavily the supply of Ore. Spot metal was carried up from 4.50¢, the lowest price reached, to 4.90¢ in June. Then, however, the chance of the further relief of the market by export orders was cut off through the collapse of the European combination, and Spelter started on a downward course which carried it to 4.40¢ in October. Efforts to support the market were made in October and November, but were without effect, and the price settled down to 4⅛¢, closing down at that figure.

Tin Plate.—We review at length elsewhere the condition of this industry in the United States, and in referring to the markets on foreign Tin Plate need only state that fluctuations throughout the year were within a very narrow range, IC 14 x 20 Bessemer Coke Tins of full weight selling at $5.30 during the first six months. July brought an easing to $5.25, followed by $5.20 as the regular quotation for large lines during August and September. October witnessed a recovery, which brought values up to $5.30. A further rise to $5.45 was realized in November, while December closed with quotations advanced to $5.50.

Financial.

It is generally conceded that in most lines of business the year just closed has been one of exceptional prosperity, despite the fact that it was a "Presidential year," and such a result might have been anticipated as naturally following a year of unprecedented agricultural abundance. The volume of trade was of unusual proportions, but as a rule prices were low and the margin of profits unsatisfactory. Cotton manufacturing seems to have been a notable exception. The present condition of trade throughout is pronounced sound, but the outlook for 1893 must be regarded as uncertain, chiefly on account of financial problems, of which the silver question and a possible Treasury deficit are uppermost. Europe, too, is under a cloud, both financially and politically, so that a conservative policy on the part of business men with reference to the future is the suggestion of wisdom. Owing to the low prices of cotton and grain and the reduced value of exports, together with the return of American securities in exchange for gold—the latter at a period as unseasonable as it is inopportune—in respect of Treasury operations, the outlook for foreign trade is less satisfactory than could be wished. On the other hand, the traffic stimulated by the Columbian Fair cannot but impart a wholesome influence, and the unprecedented accumulation of grain at Western points for forward shipment in the spring gives promise of unusual activity on the opening of navigation and remunerative freight. Even for the month just closed railroad earnings were larger than for the corresponding month last year. Payments through clearing houses outside of New York in December were the largest ever made in any month, exceeding those of 1891 by 15 %, and the year's transactions exceed those of any previous year by nearly 8 %. At New York the increase in December was 10 %, but for the year over 8 %.

Coal.

Another interesting development in the Anthracite Coal trade is chronicled this week which is capable of various constructions, viz : the separation of the Lehigh & Wilkesbarre Coal interests from the Reading management. President Maxwell of the New Jersey Central Railroad, being likewise president of the Lehigh & Wilkesbarre, is supposed to be desirous of restoring the *statu quo* so far as possible to the conditions existing prior to the Reading combine, in order to conform to a recent ruling of the courts. Naturally, it is reasoned, Mr. Maxwell takes with him the Coal company, from prudential considerations. Accordingly, the latter has issued its circular recognizing the fact, and Percy B. Heilner is sales agent. Combine prices are nowise affected, and the market remains as a week ago. Pea alongside is $2.85, Buckwheat $2.25. Some dealers in the trade assume that the separation of the Lehigh & Wilkesbarre from the Reading Company following the new finance arrangement indicates weakening which precedes final dissolution somewhere in the future. The relative importance of the financial and legal complications respectively is variously understood

Bituminous Coal is in good demand, up to the supply, and the market is stiff. Cumberland is quoted $3.25 @ $3.50, alongside; Clearfield, $3 @ $3.25

The Hardware Market.

Notwithstanding the fact that trade is characterized by the inactivity which is expected at the opening of the year and before the accounts of the past year have been balanced, there is evidence of an excellent feeling in regard to the prospects for business during the season. There have been thus far few changes in price and few announcements of new lists, but some of the manufacturers are sending out new catalogues and there is evidently a good deal of enterprise being shown in putting new goods on the market, improving plants, &c.

Advices from Chicago: Shelf Hardware jobbers report trade quiet, as their salesmen have not yet started out. Prospects are bright for the coming year, as the Northwest is in excellent shape. Farmers have enjoyed two very prosperous years, with good results to all interests directly connected with them. Heavy Hardware jobbers report their trade starting off well this year, manufacturing consumers taking liberal supplies of all sorts of stock handled in this branch of trade.

Advices from St. Louis: Trade has not quite recovered from the holiday dullness, and as it will be a week or ten days before traveling men will be on the road again, business is not likely to be very heavy. The local cold snap has enabled jobbers to clean up their stock of Skates, some of which they have been carrying for several years. Barb Wire and Wire Nails are dull and prices are somewhat weaker. Jobbers are all busy preparing for a big trade during the present year and say the outlook is decidedly encouraging. The Southern trade is not as good as might be expected, but shows a decided improvement over the corresponding period of one year since. Texas trade has been large on account of cut in freight rates.

Notes on Prices.

Cut Nails.—The Cut Nail market continues sluggish and without special feature. The demand is small but stocks are not increasing, owing to the largely diminished production as the result of the agreement among the Eastern manufacturers and the usual stoppage for repairs. Prices in New York city are $1.75 to $1.85 for small lots from store. Carload lots on dock are held at $1.60 to $1.75, according to average.

Chicago.—Cut Steel Nail are quiet, factories being shut down for repairs. Very cold weather is interfering with outdoor work, so that consumption is light at present, and manufacturers recognize the futility of endeavoring to force sales at such a time. Small lots are unchanged at $1.65 to $1.70 from stock.

Wire Nails.—The Wire Nail market continues weak and irregular, and it is understood that Nails have been sold at lower figures during the past two weeks than ever before.

Chicago.—Wire Nails are quiet on account of the light consumption. Rumors that heavy buyers are in the market to cover future requirements were in circulation last week. Small lots are selling at $1.70 to $1.75 from stock.

Barb Wire.—The market appears to be characterized by a somewhat better tone, and manufacturers are pursuing a conservative policy with reference to

orders for future delivery. The regular quotation for small lots from store in New York is $3.10 for Four-Point Galvanized, an abatement of 10 cents being made in carloads.

Chicago.—Barb Wire is steadily growing is demand, and prospects are brighter than ever for a large spring trade. Large lots are, of course, selling at lower prices than carloads, but manufacturers claim to have been able to secure an advance on such sales during the past week. Small lots from stock are still in selling at $2.30 and $2.75.

Shot.—Under date January 2 the manufacturers of Shot, without making any change in their regularly announced prices, quote them in a different form. The quotations at present are given as below, it being stated that in lots of 2000 pounds and upward taken at one time a discount of 5 cents per bag of 25 pounds will be allowed ; terms, net cash 30 days, or 2 per cent. for cash in 10 days :

Drop Shot, sizes smaller than B, per 25-pound bag	$1.45
Drop Shot, B and larger sizes, per 25-pound bag	1.70
Buck and Chilled Shot, per 25-pound bag.	1.70
Dust Shot, per 25-pound bag	2.00
Drop Shot, sizes smaller than B, per 5-pound bag	0.35
Drop Shot, B and larger sizes, per 5-pound bag	0.40
Buck and Chilled Shot, per 5-pound bag..	0.40
Dust Shot, per 5-pound bag	0.45

Freight is equalized with New York, Philadelphia, Baltimore, Pittsburgh, Cincinnati, Chicago, St. Louis, Kansas City, Omaha and St. Paul. The price at New Orleans has been advanced 3 cents per bag of 25 pounds. A change is also made in regard to Gunnies or Pockets, which will be credited at the prices charged if returned in good order, without deducting freight as heretofore.

Stanley Rule and Level Company.—This company make no changes in the discounts on their entire line of Tools. They call attention to a new form of Plane Iron recently adopted by them, and for which they claim improved features.

Practical Saw Jointer.—A. E. Rogers, Melrose Highlands, Mass., manufacturer of the Practical Saw Jointer, quotes these goods at $4 per dozen.

Wrought Butts.—The manufacturers of Wrought Butts have adopted a new list correcting the inequalities which have existed in the one which has been in use for so long a time. We give below the list of the Stanley Works, New Britain, Conn., and 78 Chambers street, New York, which is subject to a discount of 40 per cent. :

Eave Troughs and Conductor Pipe.—The revised lists on Eave Troughs and Conductor Pipe, which were referred to in a recent issue and which are printed in a condensed form on another page, were adopted from a desire on the part of the manufacturers to equalize the list on the 2 and 3 inch sizes, on which advances were made, the balance of the list remaining the same. The change will probably have the effect of stimulating the use of larger sizes, as herotofore the 3-inch has been so very low that it was used many times where 4 inch ought to have been the capacity of the Pipe. The advance made is, however, a very moderate one.

Tin Plate.—Prices have stiffened slightly on Bessemer Coke Foish Plates, as a result of fairly liberal purchases of large quantities for spring season delivery. Sales for immediate delivery of almost any kind of Plates are small, with no change in prices. Importers are closing accounts with their customers for the year, taking account of stock and making arrangements for the coming year; in fact, they anticipate little business at present. Collections are reported as fairly good, though importers complain of the small profits during the past year. From various sources the general feeling throughout the country is reported as encouraging for the coming year, the merchants seeming unanimous in the opinion that the prospects for future business are bright.

Glass.—The cold weather with snow and storms during the past week has caused somewhat of a suspension in building operations throughout the country, and will probably cause a lull in shipments of Glass from the factories. Most of the factories, however, report small stocks on hand and plenty of orders. Local trade is about at a standstill, though the price is firm, and no disposition is shown to force sales at a sacrifice of profits. The price of imported Glass remains unchanged. It is reported from Pittsburgh that a general agent has been appointed by the Plate Glass manufacturers of the United States to sell the product of the 11 Plate Glass factories and to distribute the orders. All orders will pass through the agent's hands and will be distributed by him between the factories on the basis of production. Headquarters will be in Pittsburgh, and it is understood the arrangement will go into effect about the middle of the present month. Quotations on Glass are as follows: American Window Glass, 1000-box lots or more, 80 and 15 per cent. discount; carloads, 80 and 10 per cent. discount; less than carloads, 80 and 5 per cent. discount. French Window Glass, 75 and 10 and 5 per cent. discount. American Plate ranges in price from 50 and 10 and 7½ per cent. discount to 60 and 10 and 5 per cent. discount. Imported Plate Glass, 60 per cent. discount to 60 and 10 and 5 per cent. discount.

Old Rubber.—The following are the current prices paid for Old Rubber delivered in New York:

Car Springs, in ton lots, ℔	@	$0.03¼
Rubber Shoes, in ton lots ℔	@	.03
Large Hose, ℔ ton	@	9.00
Wringer Rolls, ℔	@	.04¼
Wringer Wire Rolls, ℔ .01	@	.02
Syringes, ℔	@	.05

Old Metals.—The following are the current prices paid for Old Metals in New York:

Heavy Copper, ℔	10¢
Light and Tinned Copper, ℔	9¢
Heavy Brass, ℔	7¢
Light Brass, ℔	6¢
Lead, ℔	3½¢
Tea Lead, ℔	3½¢
Zinc, ℔	2¾¢
No. 1 Pewter, ℔	14¢
No. 2 Pewter, ℔	7¢
Wrought Scrap Iron, ℔ gross ton,	$17.00
Heavy Cast Scrap, ℔ gross ton,	10.00
Stove Plate Scrap, ℔ gross ton,	7.00
Burnt Iron, ℔ gross ton,	5.00

Old Rags, Paper, Etc.—The following are the current prices paid for Old Rags, Paper, &c., delivered in New York.

No. 1 White Rags, ℔		4 ¢
No. 2 White Rags, ℔		3 ¢
Mixed Rags, ℔	1½ @	1⅝¢
Blues and 3ds, ℔	1⅝ @	2 ¢
Hard Sized White Shavings, ℔	3 @	3½¢
No. 1 White Book Shavings, ℔	2½ @	2⅝¢
No. 2 White Book Shavings, ℔	1½ @	1⅝¢

Hemp Twine, ℔		2¼¢
Manila Rope, ℔		2¾¢
Jute Rope, ℔		1¾¢
Mixed Rope, ℔	¾ @	⅞¢

Trade Notes.

J. J Sweeney & Co , 236 Water street, New York, manufacturers of Stove Boards, are congratulating themselves on the successful trades of the past season, and announce that they are prepared for increased demands during the coming year.

Among the New Year's reminders which have reached our desk is a large wall calendar from the Wm. Cabble Wire Mfg. Company, 43 Fulton street, New York. Each month occupies a whole page, the upper portion of which contains the name and address, with a list of the various productions of the house. It is neatly printed, in various shades of red, blue, green, buff and violet, the whole forming a handsome and useful office or store calendar. On the back is a view of the Company's factory in Brooklyn, N. Y.

Charles C. Chase, Jr., has withdrawn from partnership in the Tin Plate and Sheet-Metal business of Riter Bros. & Co., 213 Race street, Philadelphia. The firm now consists of Charles J. Riter, M. M. Riter, Jr., and R. Pearce, Jr.

The double page announcement of the Highland Foundry Company, printed elsewhere in this issue, shows a general view of their stove works, which are described as the only works of the kind located in Boston, the office, salesroom and foundry being at 139-165 Pynchon street. The concern also have a salesroom at 114 Lake street, Chicago.

A. B. Kingsland & Co. of Burlington, Vt., make an interesting announcement about Kingsland's Improved Portable Oven of their manufacture. They give a list of reasons why the Kingsland Oven should be made use of, 11 of its principal advantages being noted. An illustration shows the general appearance of the Oven.

The Exeter Machine Company, 32 Oliver street, Boston, Mass., in an advertisement elsewhere, direct attention to the Exeter Radiators, in various styles. A special note is made of the artistic design and quality of finish of these Radiators, a cut presenting the appearance of the Exeter Ornamental.

A card in our advertising columns this week of the J. D. Smith Foundry Supply Company, Cincinnati, Ohio, directs attention to Radiant Foundry Facings, Blackings, &c., of their manufacture.

Fayette R. Plumb, Frankford, Philadelphia, for the better accommodation of his customers in Chicago and the West, has made arrangements with Trout & Sackel, 228 Lake street, Chicago, to carry a complete stock of all goods of his manufacture. Edward F. Ross will continue to act as Mr. Plumb's direct representative, and will carefully look after the territory assigned to him as heretofore.

Stransky & Co , New York, announce that they will on February 1 remove to 27 Murray street and 31 Warren street, the building running through the block.

S. B. Thompson, Broken Bow, Neb., announces under date December 15 that he has bought all the interest of A. L. Davis in the former firm of Davis & Thompson, dealers in Hardware, Stoves, Tinware, &c.

Wright & Hutchison have bought out Mitchell, Moser & Co., Slate, Tin and Sheet Iron Roofing, Hardware, Stoves, &c., Warren, Ohio, and will carry on the business at the old stand. C. Wright of the new firm was formerly of the firm of Kane Bros. & Wright, Caldwell, Ohio. Mr. Wright was also at one time in the grocery business at Caldwell. L. G. Hutchison was formerly located in Morristown, Ohio.

Gilbert & Bennett Mfg. Company, New York and Chicago, call the attention of the trade to the change which they have made in their Poultry Netting, from annealed wire to bright wire. It is remarked in a circular pertaining to this change that bright steel wire very much increases the strength, stiffness and evenness of the fabric, and affords a surface free from scale, to receive and retain the extra heavy pure zinc finish. All sizes will continue to be made with three long regular unwinding twists, standard mesh and full weight, length and width. Also Nos. 19 and 18 will have three strand twisted selvages. Their circular No. 92 includes illustrations of Netting and revised price-list.

Trout & Sacket, 228 Lake street, Chicago, Ill., have opened a house in that city for the introduction of the special lines which they affect. They will make a specialty of goods manufactured by the Wire Goods Company of Worcester, Mass., including their Steel Door Mats, Wire Coat and Hat Hooks, &c., and will carry a full and complete stock, and be ready to take care of the wants of the trade after January 5.

Cooper & McKee, 119 Gwinnett street, Brooklyn, N. Y., issue a neatly engraved folder in which the compliments of the season are extended to their customers. It illustrates one or two winter scenes, and calls attention also to their New Columbia Refrigerators.

Hibbard, Spencer, Bartlett & Co., Chicago, send a hanger, entitled "A Trip to the World's Columbian Exposition." Sixteen of the buildings of the exposition are shown in colors, and are numbered, indicating the order of the buildings in a tour of the grounds from the main entrance, at Fifty-ninth street. Near the top of the hanger is a larger view, showing the block of buildings used for the business of the above company. At the lower end are attached calendar sheets for 1893. The idea is a pleasing one, and will give their customers an excellent idea of the magnitude of the firm's business, and also of the coming exposition.

A prominent announcement in this issue is made by Hibberd & Spinner, 9 Cliff street, New York, who show a number of Sheet Metal Tools and Machines. Other goods referred to are Plumbers', Roofers' and Slaters' Tools, Cornice and Skylight Makers' Tools and Machinery, &c.

Joseph Huse & Son, of 95 97 Blackstone street, Boston, make an announcement in another part of this issue relative to Stove Repairs. The firm have issued a catalogue of interest in this general connection, a copy of which, we understand, will be mailed to any address upon application.

H. M. Hillson, of 247 to 251 North street, Boston, Mass., is offering the trade an extensive line of Tinware at prices which cannot fail to attract attention. An illustrated catalogue of the goods has been issued by Mr. Hillson, and he will send, upon application, a copy to those interested. The catalogue covers Stamped and Japanned Ware, Agate Iron Ware, Enameled and Wooden Ware, Wire Goods and a general line of House Furnishing Goods.

In their advertisement appearing elsewhere in this issue, the Apollo Iron & Steel Company, Pittsburgh, Pa , direct the attention of the trade to their Apollo Best Roofing Plates, Galvanized Sheets, Open Hearth Special Soft Steel Sheets and Refined Iron Sheets. The plant of this firm is located at Apollo, Pa., and is being operated to its full capacity.

The announcement on another page of the Kelsey Furnace Company, 339 West Fayette street, Syracuse, N. Y , directs attention to the Kelsey Corrugated Warm-Air Furnace. Illustrations also show the chief features of the Heater. In addition to the home office the Kelsey Furnace Company have offices in Buffalo and Denver, Col.

George T. Chambers & Co., of Livingston, Mont., have opened a branch store in Lewistown, Mont., with W. A. Selvidge as manager.

In their advertisement, appearing elsewhere in this issue, the U. S. Iron & Tin Plate Mfg. Company, of Demmler, Pa., call the attention of the trade to the different roofing plates they are putting on the market under the names of "U. S Bright" Tin Plates, "U. S. Redipped" Terne Plates and "U. S. Monongahela" Terne Plates.

Review of the Metal Trade

We are indebted to Bruce & Cook, 186 Water street, New York, for one of their pretty calendars for the year 1893. The general design of these card calendars has not varied, and the trade now recognize the appearance as belonging to the old firm of Bruce & Cook, and yet it seems to us that the decoration is a little brighter this year, and that colors are added with a more pleasing effect. The center of the card is arranged with the months in panels on either side of an illustration of the warehouse of the concern. Accompanying the calendar is their usual New Year's Greeting, containing a review of the trade and an estimate of the future. From this interesting review we quote as follows:

The year 1892 was without any special features in the market for Metals, if we except the question of tariff on Tin Plates. What action may be taken, or when it may be taken in this matter, must largely be conjecture. Unless a special session of Congress is called especially to consider it, no change in duty, and consequent fall in prices, may be looked for until the spring of 1894. The Sterling costs during 1892 were the lowest on record during the history of the trade, and the present low range of prices will probably continue for some time to come, unless unexpected conditions arise in the Iron or Steel market, with the exception that on July 1, 1893, according to present laws, a duty of 4¢ ℔ lb will be put on Pig Tin, which will have a tendency to increase the cost as it works against the American manufacturer, and the coating of English Sheets in this country. We do not think any lower prices may be looked for until action is taken by the incoming Administration. The production of Plates in this country has been principally the Terne or Roofing Sheets, some with American Steel, but mostly with English Sheets coated here. . . .

With large crops to market in this and other countries, an opportunity for a reciprocal trade with other nations, we see no reason why the coming season should not be one of great activity, which usually means prosperity, and in which we hope all may have a share; but to get the full benefit of this, there should be wise legislation by Congress touching the question of national currency, which should be, on the one hand, ample for our country's needs, and on the other, of such a character that our monetary position shall be upon a basis so sound that it will not admit of unfavorable criticism on the part of any person or nation.

The World's Fair, to be held at Chicago, should also be an element of prosperity to our people in all parts of the country.

Prize Competitions.

We wish to call attention to a number of competitions announced on other pages of *The Metal Worker* this week. The competition in skylight pattern cutting is repeated for the benefit of those who may not have noticed it in our last issue. We also direct attention to the several prize competitions, six in all, on various subjects of interest to all persons engaged in business. One relates to advertising, another calls for entertaining stories, a third relates to treatment of clerks, a fourth is on the very practical matter of keeping track of jobs, which is a question that often comes up for discussion. The next one is for a series of business maxims, while the final one is of especial interest to retailers, as it relates to the keeping of a record of prices. The particulars of these competitions, with prizes and limit of time, is presented in the announcement. A further series of weekly competitions is begun, which we believe will interest very many of our readers.

Quality of Steel Roofing.

A note of warning is sounded in letters we have received from two prominent steel-roofing companies, which merits the consideration of manufacturers of this material. Our correspondents appear to be apprehensive of a lowering of the standard which has hitherto been maintained in steel roofing. The increasing competition in this business, and the excessive desire of some members of the trade to do a large business at any cost, tend, it is thought, toward such a cutting of prices as to result, ultimately, in a general deterioration of material used in the manufacture of steel roofing and of the methods employed in its application. The use of inferior paint for factory coating and want of care in the protection of the under side of the roofing by properly applied sheeting and felting will, if indulged in, open the door to serious depreciation in the value of steel for roofing purposes. One correspondent mentions the possible adoption of a poor quality of steel as a feature likely to result from the endeavor to lessen the cost of production. But we cannot think such a contingency is very likely to arise, as steel, unlike iron, is not liable to much variation in quality, and there is no such wide range of grades to choose from. But, leaving this aside, the deterioration is quite liable to set in from other causes. The only remedy seems to be an earnest effort on the part of manufacturers to maintain the standard of steel roofing by using the best material available and insuring its proper application, afterward making such a price as will secure to themselves a fair margin of profit and sticking to it. It is a fatal mistake to make a price first and then to be obliged to get materials to suit it. To quote one of our correspondents on this subject: "One shipment of poor roofing from a factory not only unfavorably affects the trade of that factory, but is an injury to the trade at large. It has an effect that is felt far and wide."

Explosions of Gaseous Mixtures.

Every little while the daily press puts up on its bulletins some such announcement as the following: "Two workmen killed by an explosion while varnishing the inside of a fermenting tun with shellac!" "Steam-fitter killed and two others badly injured by an explosion while repairing a refrigerating apparatus!" "Woman burned to death by explosion of a lamp!" "Hotel endangered by an explosion of gas through carelessness of a servant!" On January 7 it was this: "A match struck in a coal cellar caused an explosion which demolished a building in Pittsburgh!" Three persons were killed and two badly injured by this accident, if an event resulting from well-known causes, and certain to occur when ignorance or carelessness sets these causes in operation, is properly to be called an "accident." There is little probability that such casualties will cease to be all too frequent. It seems in vain that people are exhorted to remember that, with few exceptions, inflammable gases and vapors are, fortunately, possessed of strong odors; and that wherever there is a smell of such gases or vapors danger is likely to exist if an ignited match or flame of any kind be brought into an inclosed space pervaded by the odor. Some people read only to forget. Some do not read at all. Others, with knowledge, will take the chances. These three classes—the forgetful, the ignorant, the willfully reckless—will continue to supply about the regular quota of this sort of news to the daily collection of horrors posted upon newspaper bulletin boards. What, then, is the duty of that class of publications that like, *The Metal Worker*, aim to instruct rather than merely amuse; to impart wholesome information rather than to collate news regardless of its character or effects upon readers? To cease warning seems an abandonment of duty; to endlessly repeat seems vain; yet perhaps some may take heed, and thus be prevented from bringing frightful disaster upon themselves and others. The preventive measure is simple, certain and always easily applied. When an inclosed space is discovered to be pervaded by the odor of gas, &c., that by leakage or otherwise has accumulated in it, a few minutes' thorough ventilation is entirely sufficient to remove all danger. A cylinder or pipe that has been used for containing or conveying any easily inflammable liquid or gas should always be thoroughly blown out by a current of air passed through it before it is approached with flame or heated irons, no matter what the inflammable material may have been, whether vapors of ethers, alcohol, petroleum-distillates (kerosene and the like), turpentine or benzine, or permanent gases, natural or artificial, such as are used for heating and illumination.

Artesian Wells.

The largest filter known to man is the crust of the earth. Not merely the surface soil is included in the term "crust"—rock strata, many hundred feet in thickness, sand and gravel beds, and even clays all act as effective percolators for transferring water, purified by the straining and chemical action of the materials through which it has passed, into multitudinous caverns, fissures and pockets lying at great depths below the level of the sea. Artesian wells penetrating these water veins and subterranean lakes supply water the purest in the sense of freedom from germs of disease of any obtained from natural sources. The great progress in well boring that has characterized the last decade is of immediate interest to all engaged in the supply of well-boring tools, iron pipe and fittings, pumps, or any appliances used in the procuring and distribution of water. These wells not only directly affect the metal trades, but also, by largely extending agricultural operations and making deserts to blossom, indirectly benefit trade at large.

Statistics of Artesian Wells.

A late census bulletin enables the public to form an idea of the extent to which formerly arid regions of our country have been restored to fertility by the use of artesian wells, and the figures therein given also afford a reasonable approximation to the first cost of such wells and data for estimating the cost of water thus obtained. It appears that for irrigation purposes alone there were enumerated in the last census 8097 of these wells, of which 3210 are in the State of California, leaving 4887 distributed in various other States. The average cost for the 8097 wells was $245.58, and their rate of delivery averages $54\frac{48}{100}$ gallons per minute, or 78,379 gallons

per day of 24 hours. Allowing for interest and deterioration that 16 per cent. is a fair average (it is probably too large), the cost of procuring the water is about 11 cents per day per well; or, estimating the cost per one million gallons, it averages about $1.40. This, of course, does not include cost of distribution. It is thus shown that the artesian system is a cheap method of obtaining water. The California wells cost $425 on an average. But their depth is greater and their average yield much in excess of the general average, being 164 gallons per minute, or 236,160 gallons per day. The cost of this water per well, estimated on the basis of 16 per cent. (interest on investment and deterioration) would be about 19 cents per day, and the cost per million gallons delivered would be about 80½ cents. This estimate of cost warrants the belief that artesian well-boring will be greatly extended in the near future. The data as to cost of distributing the water thus obtained are unfortunately lacking. In some cases pumping must be resorted to, and for nearly all wells efficient distribution requires additional outlay for pipes, trenches, terraces, &c., and appliances for controlling and directing the flow. In some cases these increase the cost considerably; but the general result has been highly favorable.

Value of Trade-Marks.

In discussing stove trade matters recently a very prominent manager made the striking assertion that if he were given the choice between the right to use the trade-mark of his company and their entire property in plant, including ground, foundry, machinery, materials on hand, &c., without the trade mark, he would instantly take the former, even without a dollar to back it up. It was strong testimony to the value of a good name, long before the public, known in almost every home in the land, and known also as a guarantee of high quality. The name of the company was regarded as of no consequence. Without the use of the well-tried and thoroughly advertised trade name the company would find itself without a market. The same superintendent might run the same foundry with the same set of molders on the same patterns, but his customers would want the old name on their goods or else be educated by a long and tedious process to the fact that the stoves offered them were just as good as those they had been in the habit of buying. The old trade-mark given to a new foundry would spring at once into the possession of a trade empire, in which it had been the acknowledged sovereign, and from which it could not be driven, except, perhaps, by immense expenditures and only after a long period of persistent warfare.

Trade-Marks and Firm Names.

An interesting episode, illustrative of the difference between a widely advertised name and the mere name of a company has since then fallen under our notice. A stove manufacturer visited a neighboring city, and while there concluded to call upon a fellow manufacturer, whose company, if mentioned, would be recognized as one of the best known in the country. Having arrived, as he supposed, in the immediate vicinity of his friend's foundry, but seeing no sign of it, he entered, according to his story, a corner drug store, and asked the vendor of pills to kindly direct him to the works of the Greater Mfg. Company. The apothecary scratched his head, but could not locate the concern. Thought he had heard of it, but wasn't exactly sure. Asked how long he had been on that corner, replied over 20 years. And in all that time never heard of the Greater Mfg. Company, who make the world-renowned Black Elm stove? he was asked, the inquirer gazing with astonishment at such an exhibition of ignorance. A flood of light irradiated the apothecary's countenance, and he hastened to assure the stove man that he was within two blocks of the foundry, and if he had only said Black Elm stoves at first he would have instantly been properly directed.

Select a Distinctive Name.

There is vastly more in a trade-mark than merely business egotism. Every manufacturer who thinks it worth his while to lay the foundations of an enduring business should adopt a distinctive name for his products and not change it. Year in and year out, day by day and every day, he should keep the name before the trade until it became better known than his own. Occasionally, in the case of something having special merit but which has never been named distinctively, the trade will, through some curious chain of circumstances, coin a name by which the article will be known. This is in accordance, evidently, with a natural trade law out of which the trade-mark has grown. The name of a company, or more especially of a firm, is too long for mankind generally to bother with. A short name takes the fancy. If it is particularly smooth, snappy or euphonious, and if, moreover, it represents a really high-grade article, it makes an impression on the minds of those interested which is almost incradicable.

Railroad Men.

From the fourth Annual Report of the Interstate Commerce Association we gather that the number of men employed on railways in this country during the year ending June 30, 1892, was 784,285, being an increase of nearly 35,000 over the previous year. The report also contains a statement, which is of more than passing interest as indicating the constantly growing importance of the railroad industry in its relations to our social and industrial life. The fact is therein recorded that the proportion of persons employed in connection with railroads, in all capacities, during the year covered by the report, was 1 to 82 of the total population of the United States. In 1889, it was but 1 to 87; in 1890, 1 to 85. This proportional gain has been going on steadily for several years and seems likely to continue. One conclusion is reached from a consideration of the figures above quoted, and that is, that the population of this country is increasing at a less rapid rate than that portion of it which is engaged in transportation by rail. Another fact demonstrated in the report, which is of interest to the general public, is that the number of railroad employees has in the year increased in greater ratio than the actual extension of railroads in miles during the same period. When it is considered that the lives and safety of millions in this country are daily consigned, with absolute confidence, to the care of the railroad man, the increase in the proportion of this class is very gratifying. It shows, all things considered, that railroad corporations are taking more care to insure the comfort and safety of their clients by increasing the number of those who minister to them.

Shop Stories.

PUTTING UP AN EAVE TROUGH.

Jim considered himself an expert at putting up trough, and felt in his bones, as it were, that he could do the job a little better than any one else. He was always particular to have the trough so nicely adjusted that each and every drop of water would run out. Jim went out in the country once to put up some trough on a barn. The farmer received quite a lecture on the subject of troughs in general, and regarding Jim's skill in particular. This pleased the farmer very much, as he wished the best trough that could be procured. Arriving at the barn, the usual difficulty was experienced in securing ladders of suitable length to reach the eaves, but at last this part of the work was done, and the trough put up in good shape, at least it appeared so. The conductor was connected in a proper manner, and when water was poured in the upper end of the trough, Jim was greatly surprised to observe that it did not run out as water should. Jim was quite unable to explain why such should be the case, as he always supposed that water would run down hill. In fact water was quite as celebrated for its talent for running down hill as it was for being wet. The only way of solving the mystery appeared to be by looking at the trough, and when Jim again mounted the ladder and viewed the water in the trough, he noticed that he had neglected to cut a hole in the trough after soldering on the outlet. After this defect had been overcome the water ran out of the trough in an orderly manner. It is unnecessary to mention that Jim did not deliver any more lectures to the farmer regarding how eave troughs should be put up. TIN CHIPS.

Mr. Scott of the Union Iron Works in San Francisco has full confidence in the ability of the Pacific Coast to compete successfully with any other part of the country in iron shipbuilding, whether for the navy or mercantile purposes. One special advantage is the mildness of the climate, which permits work at all seasons. Mr. Scott says: "We also manufacture everything at our yards that goes into the ships except the plates, which are not made at any of the yards. Our facilities, too, are superior to most of the yards in the East. The disadvantages we have are that the plates and armor plates have to be shipped from Pennsylvania, but we can build ships as rapidly as they can here."

THE TIN SHOP.

Pattern for Spiral.

From J. S., *New Albany, Ind.*—I would like to see published in *The Metal Worker* a method for laying out a spiral incline to fit in a cylinder. Something similar to the spiral conveyors used in conveying grain.

Answer.—In Fig. 1 is shown a general view of an article similar to that described by our correspondent. The shape is such that it cannot be made out of sheet metal without stretching. To prove this, a blank similar to that shown in Fig. 2 can be cut out and the experiment made of forming it to a spiral shape. In practice, metal. Inasmuch as the shape cannot be cut out of flat metal, owing to its resemblance to a screw, a pattern must be obtained which will require the least amount of stretching to produce the desired result. Suppose, in Fig. 3, that E F represents the diameter of the shaft around which a spiral of the kind described by our correspondent is required to go, and that the pitch of the spiral is as represented by A B in the elevation, or, in other words, that A B represents the distance lengthwise between two revolutions. If we construct the right

As all radii bear the same proportion to their circumference, this length may be obtained by geometrical proportion thus: Locate the point C on the base of the triangle, making A' C equal to O E of the section. From the point C erect a perpendicular line cutting the hypotenuse in D; then A A' will be to C A' as B A' is to D A'. Since A' B is the required length of the inner circumference, then D A' will be the length of radius R, Fig. 4, by which to describe it. Then, making the distance M N equal to the projection of the required spiral from the same center, we strike the outer circle. Cutting the piece in two along M

Fig. 1.—General View of Spiral Conveyor.

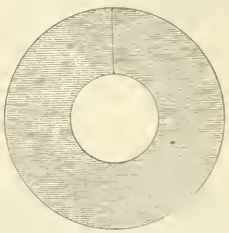

Fig. 2.—Suggested Blank for Spiral Conveyor.

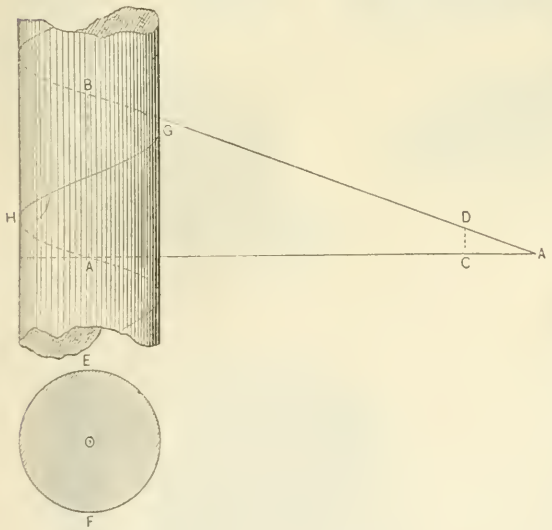

Fig. 3.—Means of Determining the Length of a Revolution of the Spiral.

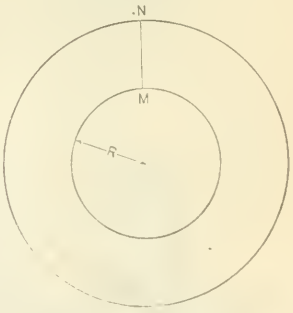

Fig. 4.—Approximate Pattern for a Single Revolution of the Spiral.

PATTERN FOR A SPIRAL.

a spiral is made by cutting out blanks similar to those shown in Fig. 2, then heating red hot if the metal is very heavy, and by the use of dies, pressing the metal into the desired shape. An article published in *The Metal Worker* some years since on the same subject is as follows:

If our correspondent will give the matter a moment's thought, he will be convinced that the shape which he requires is one that cannot be produced in sheet metal without some stretching. In other words, the shape is the section of a solid, rather than an envelope, a distinction which makes a difference in the matter of developing the shape and of producing it in sheet

angled triangle A' A B, so that the base A' A shall be equal to the circumference E F, and the hight A B equal to the distance between the revolutions, then the hypotenuse A' B will represent the length of the inner side of strip to form the spiral flange. If such a triangle be made of paper or thin metal and placed with its perpendicular at the back of the shaft, exactly as shown in the diagram, and then wrapped around till the point A' reaches the point A at the back of the cylinder, the hypotenuse will form the curve line B G H A on the cylinder, which will be the line to set the flange to after it is made. The next thing to be done is to ascertain the length of radius by which to describe the inner line of the flange.

N, we have a pattern that will make a single revolution of the spiral. It will, however, be necessary to stretch this pattern slightly with the hammer, or by means of a suitable die, in order to compensate for what is taken up by drawing the spiral out to give it the shape indicated in Fig. 1. By cutting out the pieces after the plan here indicated, and by joining them, either by lapping and riveting or by placing pieces under the two abutting ends for forming a butt joint, a spiral of any length may be obtained. By using the butt joint last referred to, just as many pieces of the kind shown in Fig. 4 will be required as there are revolutions to the spiral. If the lap is taken, as first suggested, each piece will make just as much less than a revolution as the amount consumed by the lap.

COPPERSMITHING.

ART OF COPPERSMITHING.

XXXVIII.*

Pipes for Heavy Work.

The earlier pages were principally devoted to a description of the working of light sheet copper in the manufacture of cooking utensils or small articles generally, and known better as the braziers' art. This was followed by the work for the locomotive and marine engine, which, it will have been seen, in the main comprises the making of copper pipes, large and small, bending and twisting them into any shape to suit the position desired or exigent circumstances, and is known as light coppersmithing. From this point an endeavor will be made to interest the reader with some examples of heavy work, such as he may occasionally encounter in his way (as has happened with the writer) while moving from shop to shop, either from choice or necessity. To keep as nearly in a progressive line as possible, the subject of pipes will be resumed and considered in their various forms in large and heavy work for application in breweries, sugar and still houses.

In breweries the principal uses for pipes are for refrigerators and attemperators, and these consist of coils of pipe of various forms which are made to fit the coolers or fermenting vats for the purpose of raising or lowering the temperature of the liquor by the aid of a current of water or steam passing through the pipes.

In Fig. 428 is presented a view of the interior of a shop engaged in this kind of work, which gives the reader a good idea of the conveniencies that are necessary to perform it successfully. The photograph from which the cut was made was kindly furnished by G. Hendry & Co. of London, England, especially for this work, with a view of giving the reader a more faithful illustration than can be done by a pen description. The picture is so complete that it would seem to need no further explanation.

In Fig. 429 is represented a cooler having a group of pipes made to fit it, and so arranged that the pipes may be raised or lowered in a convenient way when necessary to do so for cleaning. This grouping of the pipes is perhaps among the oldest contrivances used for cooling purposes in the manufacture of beer. It consists of a number of pipes of equal length, grouped together with horseshoe bends to form a continuous run of piping sufficient to fill up the space on the bottom of a cooler, as shown. The horseshoe bend is shown in Fig. 430, and is made of brass or gun metal. The pipes are separated from each other by boards called channel boards. The two end pipes are left open and are provided with hose unions for connection with the water supply, which is made to run along inside the pipes in the opposite direction to the wort in the cooler. Fig. 431 shows a set of pipes for a small cooler without the

lifting appliance shown in Fig. 429. For large coolers two and three sets of pipes may be and often are connected together, each working independently of the other, but all bolted on the same frame by means of the lugs on the bend. By this arrangement smaller pipes can be used and the cooling surface increased, while the consumption of water is proportionately diminished. The pipes are usually soft soldered into the bends. The foregoing aparatus is designed and used for cooling purposes, but the conditions are sometimes changed, and similar pipes are used for warming, which are called attemperators, and others are used for boiling coils. In Fig. 432 is represented a boiling round—that is, a round vat or tub, supplied with a coil of copper pipe lying on the bottom, which is set with a gradual fall toward the center so that the condensed steam or water is drained off through the bottom, the condensed steam keeping the live steam at the full pressure, thus making the liquor boil quicker, and preventing a waste of steam, which must occur if it was allowed to blow off into the air. The steam is turned into the coil by a valve fastened to the side of the round as shown at X, Fig. 432. Fig. 433 is the same in principle, but made to suit an oblong vessel. This vessel is called a back, on account of its shape, so that it may be easily distinguished from a round vat. Another form of liquor back is shown in Fig. 434. The set of pipes is furnished with either ball joints or gland and stuffing box, so that it can be raised or lowered at will for cleaning or to get it out of the way when necessary to do so. It is therefore much better and more convenient than the kind with fixed coil. Vats and backs are also fitted with spiral coils as shown in Fig. 435 and Fig. 436. When they are fitted with coils in this way they are used principally for fermentation, thus distributing the temperature evenly through the mass of liquor.

Let us make one of these coils, and let the pipe of which it is made be 3 inches in diameter and the coil consist of four rings, Fig. 437, the outside ring being 6 feet in diameter from center to center, and the inside ring 2 feet. The first thing is to find the length of the coil, which we do by marking out the coil in Fig. 437, as follows: Draw the line Z Y, making it 6 feet, and bisect it in V, and with V as center and V X as radius, equal to 1 foot, describe the semicircle X U W; then divide X Z and W Y into three equal spaces, X *a*, *a b*, *b* Z; W *c*, *c d*, *d* Y, and from V on V Z lay off V *e*, equal to one of the spaces X *a*, and divide V *e* at T, then from the point T as center and T W as radius, describe the semicircle W S *a*, changing the centers V and T for each semicircle in succession until the coil is complete. Now, we have seven semicircles, the center one, X U W, 2 feet in diameter, the next, W S *a*, $2\frac{2}{3}$, the third, *a* R *c*, $3\frac{1}{3}$, the fourth, *c* Q *b*, 4 feet; the fifth, *b* P *d*, $4\frac{2}{3}$, the sixth, *d* O Z, $5\frac{1}{3}$, and the seventh, Z N Y, 6 feet. Now adding these all together and dividing by 2 we have

$$\frac{2 + 2\frac{2}{3} + 3\frac{1}{3} + 4 + 4\frac{2}{3} + 5\frac{1}{3} + 6}{2} = 14,$$

or a circle of 14 feet equal to coil; and multiplying this by 3.1416 we get $14 \times 3.1416 = 43.9824$ the length of the coil. Hence we want 44 feet of pipe (exclusive of that required to make the joints) to make the coil. The pipes may be made, fitted and bent and joined together with socket joints.

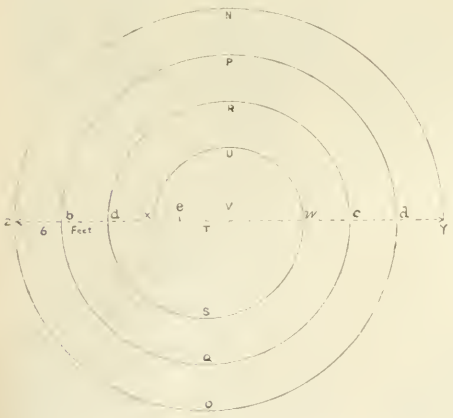

Fig. 437.—Diagram for Coil.

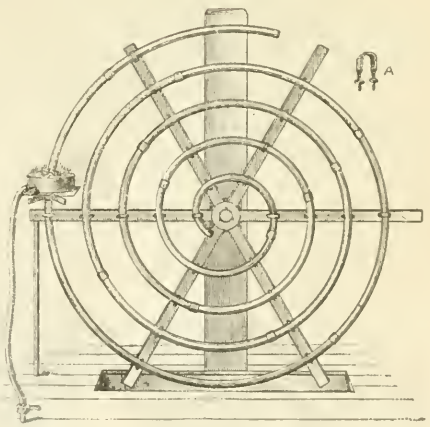

Fig. 438.—Wheel and Axle for Brazing Pipe.

ART OF COPPERSMITHING.

BRAZING OR JOINING FLAT COILS.

Copper pipe used in the making of coils of various kinds has usually been made in lengths varying from 10 to 14 feet, therefore all coils of any considerable size must be made in sections and joined or brazed together. To do this brazing in the most convenient and expeditious way it is necessary to provide a wheel and axle, as shown in Fig. 438, upon which the coil may be fastened with a strap, A, and held in position for manipulation as each section of pipe is added to the coil and the process of brazing together is being executed. The wheel and axle are fastened to a suitable post and over a pit, the axle being placed about 3 feet from the floor, so that

the socket when level will be on a line with the center of the axle, and can easily be attended to when the coil exceeds 6 feet in diameter. The accompanying illustration, Fig. 438, sufficiently explains itself.

The method given above for describing a flat coil is perhaps the simplest that can be used. For those who desire to make a coil nearer the truth, it is necessary to resort to what is called an eye—that is, a group of points situated in regular polygon form for centers, which may begin with a triangle, as in Fig. 439, or with any other number of points, as in Fig. 440. I will explain these two methods, and leave the learner to pursue the further study of the subject as he may desire. In Fig. 439, the eye of the coil which governs the distance between the rings is an equilateral triangle. Now let it be required to make a coil 6 inches apart from center to center of the rings, then we divide the 6 inches into three and erect a triangle, A B C, making the sides equal to 2 inches; then with B as center and B *a* as radius, describe the arc *a b;* and with C as center and C *b* as radius, describe the arc *b c*, and with A as center and A *c* as radius, describe the arc *c d*, and repeat the process until the size of the coil is reached. In Fig. 440 the eye of the coil is a hexagon. Now let the distance apart be the same as in the last example. Then 6 inches divided into six parts gives us 1 inch for one side of a polygon of six sides. Draw a hexagon, A B C D E F, Fig. 440, and make the sides equal to 1 inch; then from A as center and A *b* as radius, describe the arc *b c*, and with B as center and B *c* as radius, describe the arc *c d*, and repeat the process around the polygon, taking each corner in succession, until the coil has been completed the required size.

Fig. 439.—Laying Out Coil with Triangle for Center.

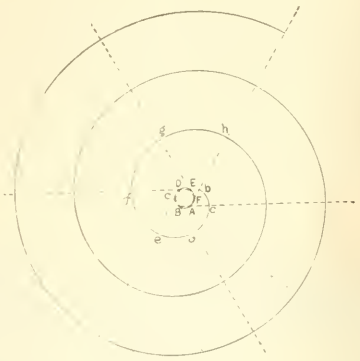

Fig. 440.—Laying Out Coil with Hexagon for Center.

Fig. 441.—Portable Coil.

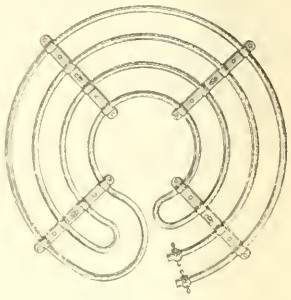

Fig. 442.—Coil with Openings Together.

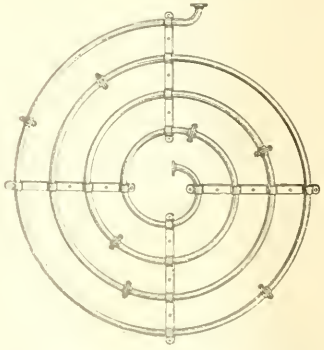

Fig. 443.—Coil with Flanged Joints.

ART OF COPPERSMITHING.

The length of these coils may be obtained in a similar way to that already given—that is, by adding together the diameters of all the circles which compose the coil and multiplying by 3.1416 and dividing the product by the number of points in the eye of the coil.

Fig. 441 shows a portable coil and the

manner of using. The three supporting stays are iron, bolted together, and provided with eye bolts for suspending rods, by which the coil may be hung in a vat or tun at any hight desired. The ends of the coil are supplied with unions for connecting leather or rubber hose. These portable coils are quite handy, as they may be removed readily with pulley blocks out of a tun when not required. Portable coils may be made any other shape desired.

It sometimes happens that it is better and more convenient to have the two ends of an attemporator—that is, the outlet and inlet—lying side by side or close together in preference to having one end cross the coil as in Fig. 441. In this case we resort to another plan which is shown in Fig. 442. When it happens that the workman does not possess the skill necessary to perform the operation of brazing the sectional joints of the coil, flanges may be employed for joining the sections together, as shown in Fig. 443, the flanges being made just wide enough to get bolts in, and of sufficient strength to make the joints secure. It may sometimes be better to put them together in this way, so that any section may be taken out for repairing when necessary.

To find the length of a spiral coil, as in Fig. 435, whose diameter is 6 feet from center to center of pipe and having three rings, with a rise of 1 foot to each ring, it will be seen that as each ring rises 1 foot, that the length of pipe required for the three rings of the coil would be the hypotenuse of a right-angled triangle whose base is equal to the circumference of three flat rings as the base, and the foot rise of each of the three rings of the coil as a perpendicular. Then the length of the coil is

$$\sqrt[2]{(6 \times 3.1416 \times 3)^2 + (1 \times 3)^2} =$$

56.58, or 56 feet 7 inches nearly; therefore to make a spiral coil, as in Fig. 435, we require 56 feet 7 inches of pipe, which is made of convenient lengths and put together with socket joints as before directed.

The Cast Iron Pipe Consolidation.

We reported two weeks since that a movement was on foot to bring about a consolidation of the cast-iron pipe foundries in the country, the first step being to bring together the Western concerns and the second to consolidate the Eastern shops. We are advised that the latter movement has not progressed far and that a consolidation is improbable. A number of denials have been published concerning the Western fusion. The fact is that two weeks since the representatives of nine Western and Southern works met in this city, and the first steps toward a consolidation were taken, the works represented being the Lake Shore, St. Louis, Addyston, Dorman, Long & Co., Bessemer, Columbus, Chattanooga, Anniston, Bradford and South Pittsburgh. Prior to the meeting the different plants had been appraised and a statement had been secured showing the financial results obtained in recent years. On the basis of these reports the allotment of stock in the new concern was made. It is reported that additional amounts will be offered to the public. Nine directors were elected and there was some discussion relating to the presidency. Another meeting is to be held on the 18th instant. We understand that on the day following the meeting conferences were held with a number of the Eastern pipe founders at which prices on some large contracts then pending in this State were discussed.

The Canadian Pacific Railroad is blocked with snow worse than for five years.

Patents, Patentees and the Public.

Compulsory Licensing and Lapse by Failure to Work.

BY BERNHARD T. VETTERLEIN.

Should not the present system of granting patents for inventions be amended?

The law as it is is not so satisfactory as to merit disinterested support, and it is surely worth consideration whether the defects can be removed by amendments.

Earnest and persistent attempts have been made at intervals to abolish the law and substitute a grant of money by the Government in place of patent privileges, and it is reasonable to anticipate a renewal of the agitation with more or less strength, in view of the well-acknowledged imperfections which are removable and have not been removed. Patent laws are good only when they offer the most equitable arrangement for protecting inventions from plunder, and are at the same time fair to the public.

Any person who has discovered a new and useful art, machine, manufacture or composition of matter, or any new and useful improvement thereof, under certain restrictions, may obtain a patent. The grant is to the author of the invention and for the exclusive right of practicing it for a term of years. The consideration for which the grant is made is the benefit resulting to society by the practice of the invention. Now, during a year a large number of patents are issued, of which some are for alleged improvements and some for trifling alterations of patents in force. The market becomes crowded with patents, few of which may be of any value, but all of which may be productive of embarrassment.

A large number of these unmeritorious patents are never practiced or intended to be practiced, but held in reserve till by some subsequent improvement they become practicable and have a commercial value. The holder of the original patent then has the game in his own hands. This is a genuine grievance, and though the last invention gives commercial value to the series of which it is the crown, the owner is helpless unless he can make some fair arrangement with the proprietors of the anterior patents. It is quite true that an invention when first tried is never complete in all its details, but if the inventor does nothing to perfect it and someone else does, the latter during the life of the first patent is subject to the disposition of its owner. It must be remembered that the greater the success of a discovery the larger will be the gain to the public when the patent expires. Experience often suggests slight but valuable alterations. The public then acquires not an invention which may answer the purpose for which it was intended, but an invention which has been made capable of perfecting the anticipations of its discoverers. To give any one an exclusive right to work his invention is equivalent to trusting that he will devote his time and skill in getting it introduced.

It may also be urged, with good reason, that the owner of a fundamental patent of real merit, as the law now stands, can become the monarch over one field of industry, and refuse to grant a license to make his apparatus, or work his process. Patents are not intended to be monopolies. The statute of monopolies, which removed those "odious, hurtful and nauseous weeds in the fair field of industry," made an express exception for inventors, "so as also they be not contrary to law, nor mischievous to the State by raising the price of commodities at home, or hurtful to trade, or generally inconvenient." It is said that a monopolist controls the market, but that the owner of a patent privilege cannot force the public to buy the article he manufactures. But the experience of the public is somewhat different from this, and it would be very often difficult, if not impossible, to make a distinction between a monopolist and the owners of many patent privileges.

The law should be amended so as to provide:

1. That the patent shall cease and terminate if the patentee or owner does not make effective use of the invention within a fixed period.

2. For the introduction of compulsory licenses; the amount of royalty to be determined by arbitration when differences of opinion cannot otherwise be reconciled.

The practice of granting patents for inventions prevails over the whole civilized world. In most of the countries provision is made in the law for determining and ending the life of a patent, unless worked within a definite time or by the non-payment of fixed annuities. In some countries there is a clause relating to compulsory license. In the Argentine Republic, for instance, the law is plain and to the point. After quoting the law of this Republic, we shall give the sections of the statutes of other countries bearing on the two amendments suggested in this article.

The Argentine Republic.—Argentine Republic in 1864 enacted the following:

THIRD SECTION, ARTICLE 29.—When such certificates of addition (*i.e.*, for improvements in patented articles) have been obtained by other than the original patentees, they do not confer on their owners the exclusive right of working their invention, except under the condition of paying a premium to the original inventor, the amount thereof having to be fixed by the commissioner, by taking into account the importance of the improvement, and of the part used of the original inventor.

ARTICLE 30.—The original inventor has the option between availing himself of the provision contained in the preceding paragraph and of working the improvement jointly with the improver. If he chooses the latter, a patent of addition shall be delivered to him on the same terms as that to the improver.

ARTICLE 32.—If two or more parties shall apply at the same time for a certificate of addition for the same improvement, and if they shall not come to some arrangement between themselves, no patent shall be issued to either. The same provision applies also to letters patent.

TITLE 5, ARTICLE 47.—All patents duly issued become void whenever the invention has not been worked within two years of the issue of the patent; whenever the working has been interrupted for a similar period, except by circumstances beyond control, &c.

ARTICLE 49.—No special judicial decree of nullity or lapse is required for causing the patent discovery or invention to become public property; the mere fact of nullity or lapsing suffices for authorizing every one to work freely the patent articles.

Austria.—If within one year from the date of the patent, the pateutee has not begun to work his discovery, invention, or improvement in the empire, or whenever he has interrupted his work for two complete years.

Barbados.—Work must begin within a period of three years.

Belgium.—The patent must be worked in Belgium within one year from the commencement of working abroad. The time may be prolonged for one year. At the expiration of the first year, or the extension, the patent shall be annulled for omission.

Brazil.—The patent shall lapse, if the patentee does not make effective use of the invention within three years; if the patentee suspend the effective use for more than one year.

By use is understood the effective exercise of the patented industry and the supply of the products in proportion to their employment or consumption. On proof that the supply is evidently insufficient for the needs of employment or consumption, the employment can be restricted to a zone, &c.

Bolivia.—The patent must be worked within a year and a day.

Canada.—The patent is null and void at the end of two years unless the patentee or his assignee shall have commenced, and shall after such commencement continuously carry on, in Canada, the manufacture of the invention or discovery patented in such manner that any person desiring to use it may obtain it or cause it to be made for him at a reasonable price at some manufactory or establishment for making or constructing it in Canada.

Very many of the counties have this section: The inventor of an improvement cannot make use of the improved article while the patent for the principal invention lasts without an authorization from its inventor. Nor can the latter employ the improvement without agreement with the former.

Chili.—For each patent, a proportionate term shall be fixed for the establishment of the machinery, plant or manufacture, on the conclusion of which the patent shall commence to run. If at the expiration of this term the invention has not come into work it shall lapse, as it shall also if the working be discontinued for more than one year.

Colombia.—When not practiced during a whole year the patent is void.

Denmark.—By royal decree the invention must be carried out within a year.

Ecuador.—The patent must be worked within a year and a day.

Finland.—It is necessary to publish a description three times within two months from the day of the issuing of the patent, and within two years to send evidence that the patent is in full working operation. The term may be limited to one year and also extended to, at the utmost, four years, but afterward evidence must be given of continuous working.

France.—None but the patentee or person interested through him . . . can during one year legally obtain a patent for an alteration, improvement or addition, &c. Nevertheless, any person who shall wish to obtain a patent for an alteration . . . may during the said year make an application, which shall be transmitted to and remain deposited under seal. . . . At the expiration of that year the seal shall be broken and the patent delivered. Preference is given to the original patentee for all alterations, improvements and additions for which he shall have demanded during that year a certificate of addition.

The patent must be worked within a term of two years, and if the working is discontinued for two consecutive years, the patent ceases and determines.

Germany.—If the patentee fails to work his invention in Germany to an adequate extent, or at least to do everything that is necessary to insure its being worked, a patent can be declared void after the lapse of three years.

Whenever the grant of licenses to others to use the invention appears to be demanded in the public interest, and the patentee nevertheless refuses to grant such licenses upon adequate compensation and good security, the patent lapses.

Great Britain.—If on the petition of any person interested, it is proved to the Board of Trade that by reason of the default of a patentee to grant licenses on reasonable terms, or the patent is not being worked in the United Kingdom, or the reasonable requirements of the public with respect to the invention cannot be supplied, or any person is prevented from working or using to the best advantage an invention of which he is possessed, the board may order the patentee to grant licenses on such terms as to the amount of royalty . . . as the board, having regard to the value of the invention and the circumstances of the case, may deem just. There is also a provision for the forfeiture of patent on non payment of annulty.

Guatemala.—The time is limited to two years for the establishment of the machines; . . . forfeited if, after commencement, the working is abandoned for more than a year.

India.—The patent lapses on failing to grant licenses on reasonable terms—same as in Great Britain—substituting the Governor-General in place of the Board of Trade. The Governor-General may order the inventor to grant, or may himself, on behalf of the inventor, grant licenses on such terms as he may deem just.

Japan.—Persons that are desirous of obtaining patents for articles that are improvements upon other patented inventions must secure the consent of the original patentee. If the original patentee should refuse his consent, and the Minister of Agriculture and Commerce deems the refusal obstructive to the improvement of the inventor, he may grant the improver special permission to use the original invention, together with the improved part. In such cases . . . the Minister shall cause the improver to give approximate sums of money to the original inventor by way of compensation. The patent is void unless practically publicly applied within two years, or suspended for two years thereafter.

Liberia.—The patent must be worked within three years, and refusal to license works forfeiture.

Norway.—The proprietor of a patent shall during a period of two years . . . have the sole right of obtaining a patent for improvements. Applications by others must be kept under seal for that period. The patent must be worked within three years, and is forfeited if the working is discontinued for one year.

Orange Free State.—Non-use for two years works a forfeiture.

Peru.—The patent must be worked within two years, or period stipulated in the privilege.

Switzerland.—The patent lapses if not carried into effect in the third year.

Queensland and South African Republic.—The law is the same as in India.

Uruguay.—If it be a stranger who obtains a certificate of addition, he shall only enjoy the right to work his invention upon the condition of paying to the first inventor a premium, the amount of which shall be fixed by two experts appointed by the parties interested, with a third in case of disagreement. The executive fixes the time for the working of the privilege at the time of the granting of the patent.

Venezuela.—The patent is canceled when annual payments are not made, or when the working is not commenced within two years or discontinued during two years.

Sweden.—Must be worked within three years to an adequate extent. If working is abandoned for one year the patent is forfeited.

Portugal.—The patent for an improvement cannot be made during the first year of the patent granted for the principal invention, save to the person who obtained that patent. Any one who does not carry out his invention within two years . . . or has ceased to use it for two years consecutively . . . shall forfeit his said patent.

Russia.—Patents shall not be granted for trifling or unimportant discovery, invention or improvements, indicative only of inventive genius, without offering any new advantage or utility. The privilege must be put into completed practice or execution during a specified term, and lapses unless before the expiration of six months thereafter there is presented to the proper department proof that it has actually been put into practical execution.

South Australia.—Patents cease on non payment of annuities at the expiration of three years. They are also liable to be revoked after the expiration of three years if it appears that either the patentee or his licensee, or his assignee, has not before that time used the patented invention to a reasonable extent for the public benefit.

New Zealand.—Annuities are payable in five years. The invention must be brought into actual, practical use within the space of two years from the date of the patent.

Spain.—The patent must be worked within two years in Spanish territory, and proved. Omission to operate the invention for one year and a day thereafter forfeits the patent.

The sections of the laws of the several countries quoted should be sufficient to show how other civilized nations look upon patents. There is not a country, small or large, which has not a patent law and some provision bearing on the amendments suggested. Of course, even with the corrections intimated, the law would not be as it should be. Two amendments are sufficient for present consideration.

It is quite true in general and it would be quite logical to say that licenses should not be granted at all, but if patentees have the power to grant licenses they ought to be compelled to grant them to whomsoever shall offer a fair percentage in return. It can be argued that, were it in every one's power to work a patent on the payment of a certain sum, there would be less incentive to the infringement of patent rights, so called, and consequently less necessity for harassing litigation and expense. Of course, a patentee can reply that the right of property in his invention having been accorded to him by the office, he should be left in an untrammeled position regarding any disposition he may wish to make of it. He ought to be left free to dispose of it, and equally free to refuse to share his rights with any one except at his own time and on his own terms. But a compulsory license, equitable both to the inventor and to the public, with a compulsory working limit, would meet the requirements. The preliminary examination is of very little use. The same system prevails in many countries. It was, and is yet, supposed to be a preventive to litigation. It is and would be impossible for any Patent Office, or its examiners, to be acquainted with the details of every process or manufacture. If the Government could guarantee the patent, then a preliminary examination would be of value.

In the cases of the strikers who have been on trial in the courts at Pittsburgh for some days past on the charge of riot at the time of the strike at the Duquesne Steel Works of the Carnegie Steel Company, Limited, last August, the jury returned a verdict on Tuesday, the 10th inst. Thirteen men were on trial, and of these ten were found guilty of riot, two of unlawful assemblage and one was acquitted. The verdicts in these cases are expected to have no inconsiderable influence on the balance of the Homestead cases, which will come up for trial in the Pittsburgh courts some time during this month.

The Canadian Minister of Finance, Mr. Foster, is untiring in his efforts to improve trade relations with England and France, from which countries he recently returned. Previously he visited the West Indies, with a similar purpose, hoping to recoup any shortening of trade through the operations of the United States tariff. Besides visiting Paris he reports that he "initiated several bases of action in connection with our commercial agents in Great Britain, which will have the effect of bringing in closer touch Canadian sellers and British buyers, thus augmenting the necessary trade with Great Britain. I found a very lively interest on the part of dealers there in the products of Canada and the possible chances of trade being done therein."

WORLD'S FAIR NOTES.

Display by the Army.

To the War Department was allotted about one-fifth of the floor space of the Government Building. This came to be located in the southeast corner of the structure and the space was divided up between the several general divisions of the service. The staff detailed to make the exhibit by the Secretary of War was Major Clifton Comly, in command, representing the War Department; Capt. John F. Rodgers, Quartermaster; Capt. William L. Marshall, Corps of Engineers; Surgeon La Garde, Medical Department; Capt. A. H. Russell, Ordnance; Capt. R. E. Thompson, Signal Corps; Lieut. H. L. Harris, Artillery.

For over a year these officers have been devoting their time to preparing the displays. Everything is now in shape and before long shipments will begin from Washington and other sources from which material is to be drawn.

In a general way the ordnance department will be perhaps the most interesting. The longing in the heart of the average civilian to see a big gun will be fully gratified. One throwing a shot twelve inches in diameter will be in the Government Building. It will weigh 50 tons. Smaller cannon for field service will be plentiful.

The actual manufacture of rifles will be carried on in the exhibit. Bullets and cartridges will be made in the sight of the multitude. Torpedoes for use in military operations will also be manufactured, but when people want to see torpedoes that are torpedoes they must visit the battleship "Illinois," where the Navy Department has its exhibit. Care has been taken not to have the two departments overlap anywhere. Of course, the ammunition will look like the real thing, but the powder would not explode, not even burn. No army officer, however brave, would care to have real gunpowder and dynamite flying around among workmen in a crowded building. The spectators, however, will not know the difference.

To show the construction of heavy ordnance by actual work was not feasible, but it will be exhibited in varied phases, so that a good idea of the process can be gleaned. Only the processes generally known can be shown, as the War Department is not accustomed to unfolding its secret methods on the housetops. A testing machine to prove iron and steel to the extent of 100 tons to the square inch, doing its work as perfectly as if in an arsenal, will also have its place in the ordnance department. Nothing will be lacking from a silver-mounted revolver to the 50-ton gun. Gatling guns will not be the least important.

The signal corps will show how communication in the field is kept up by telegraph and telephone. The utility of the balloon in military operations will be demonstrated beyond a doubt, if one should now remain. These balloon tests will be extremely curious to non-military people.

In the signal corps' exhibit will be some 85 magnificent pictures of arctic scenery taken by the Greely arctic expedition. They are among the most highly prized archives of the corps. All the appliances for using signals will be included in the exhibit, and great pains have been taken to make it thoroughly popular. It was a difficult task, but it is said there is no doubt about it being well done.

The post hospital will contain 24 beds, and will be an exact reproduction of the regulation hospital at a military post. It will also contain a medical scientific exhibit, which will be of great interest to physicians at least. Then there will be the tent hospital for actual service on the field of battle. The ambulances for carrying the wounded from scenes of carnage to the field hospital will be there. The appliances in use by army surgeons to save life before the hospital can be reached will be fully represented. So complete will be the exhibit of the medical department that the surgeons could take the field for active service directly from the Government Building.

In service it is the quartermaster's duty to provide food and clothing, and the quartermaster is quite a man in extensive operations, where a base of supplies must be maintained. In that department of the army's exhibit will be seen how large bodies of troops are fed, how they are clothed, and the way transportation is given.

The engineer corps was greatly handicapped in preparing its exhibit by the nature of things. While the other branches of the service could bring things to show, the nature of the engineers' work precluded this. A canal might be the hight of engineering skill, but it could not be brought to Jackson Park. A bridge making its designer famous must remain where it was built. Since river and harbor improvement was begun by the General Government over $225,000,000 has been expended under the direction of the engineer corps. There are now 747 different pieces of work under way. It is scattered from Portland, Maine, to San Diego, Cal.

Capt. Marshall, the United States engineer at Chicago, has been a year bringing the exhibit of his corps together. He has written numberless letters to brother officers asking for pictures of Government work in their districts. Cordial has been the co-operation extended him. The negatives taken under the direction of the corps were sent to Capt. Marshall.

The space assigned the engineer corps was under the gallery in the extreme southeast corner of the Government Building and 28 windows open into it about 7 feet above the floor. What might have been an unattractive space has fallen into Captain Marshall's plans most admirably.

Three transparencies, one above the other, will hang in each window. The transparencies will be draped at the side, and will resemble panels in a curtain. The transparencies will represent many of the most noteworthy feats in army engineering. The one showing the largest stone arch on the globe, in the Washington aqueduct system, and another, of the movable dams on the Ohio, are certainly striking. There are 84 in all of the transparencies.

Over 100 large framed photographs will hang between and under the windows. Several hundred smaller photographs will be shown in the albums, a full description of the Government work represented appearing on the opposite fly leaves. A huge transparency, 16 feet long, will give a panoramic view of Chicago Harbor and Government works here. The view was taken from the lighthouse and covers the field of vision from northeast to west. Far to the southward the exposition buildings are seen. Tugs are towing in schooners and a steamer is just leaving port. A great fleet of shipping is under the breakwater. Most people will get their first idea of what Chicago Harbor entrance is like from this beautiful transparency, which is now almost ready for the artists.

The geological survey will have some handsome transparencies in the Government Building. They will be of natural scenery mostly. The illustrations of the engineer corps will be confined to works of the corps.

Some models of harbor work will also appear in the exhibit. Fixed torpedoes, so far as the engineering service uses them, will be represented, but no especial show of torpedoes will be attempted. While most of the engineering works of the army are for purposes of peace, a full exhibit of military bridges and lines will find a place in the corps' space under the gallery.

Construction Goes on as Usual.

The cold weather has not delayed construction on the new buildings to any great extent. The cost of breaking ground for the foundations, however, has been materially increased, and the number of men required in that work has been largely augmented, the frozen ground being almost as solid as rock. Fully 200 men were engaged last week in putting down the foundations of the building commonly known as Liberal Arts, but which is termed the Anthropological Building. It is located between the Forestry and Agricultural buildings.

In Machinery Hall, where time counts for so much these days, the cold stopped all concrete and brick work around the boilers and engines. The platforms for the engines are rushed at a great pace. The ceiling of the building is nearly ready for plaster. Between 300 and 400 men are employed in the building. The painting of the interior of Manufactures Hall goes on regardless of weather. The calcimine machines send calcimine through the hose just as well when the thermometer is at zero as in midsummer. The west part of the hall is now entirely painted, and the wonderful effects of that space upon the eye become even stronger, since the interior is all of a light hue, except the iron supports. Week in and week out nearly 100 painters have labored. Their work is now nearly complete, from the wooden columns to the dome 245 feet above. Within ten days the hall will be ready for the installation of exhibits.

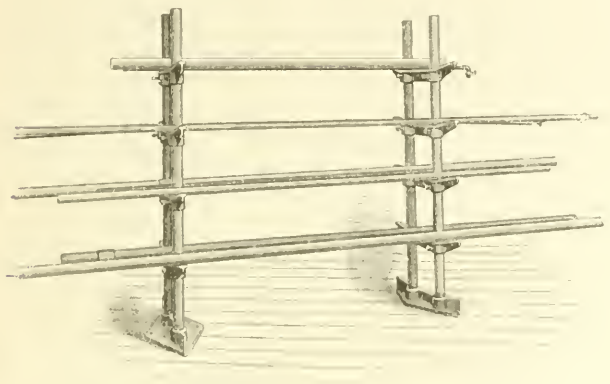
A force of carpenters were employed last week taking up the coverings which had protected the hardwood stairways of the Agricultural Building during the period of construction. The floors have been chalked off for exhibits and every post and every space has its number. The hall would be entirely ready for the oncoming flood of material were there not little snow banks on the floor here and there. They tell of spots in the roof which must be patched before it will be safe to place much merchandise in the building. Painters have completed their work at the Fisheries Building and the interior looks trim and tasty. Nothing more is to be done and material can be received at any time. Mines and Mining and Electricity buildings are also ready. Rapid progress has been made on the electric elevated road the last fortnight. The standards for nearly the entire line are up and track laying has begun in the rear of Machinery Hall. About the only thing that the cold has brought to a full stop is dredging in the lagoon south of the Agricultural Building. The dredges are frozen in ice 1 foot thick. The old whaler "Progress" is as solidly imbedded in ice as if it were again in the arctic regions. The scaffolding has been taken down from the main entrance of the Administration Building, and the first clear view of the architectural beauty of that structure obtained. It was all that had been promised for it. Enough of the scaffolding has been removed from the main entrance of the Transportation Building to discover its artistic beauty. The decoration alone cost $15,000. The last building to be erected by the fair will be the Public Comfort Building. Work will begin the coming week.

Space to be Allotted at Once.

Every available foot of space in the big buildings will be practically awarded to intending exhibitors within the next ten days. The ultimatum has gone out from the Director-General's office that the chiefs

would be expected to allot their space at once and end their troubles. This means a great slaughtering of applications, a dread of which has caused whatever delay that may be complained of. In the Manufactures Building there are possibly ten applicants to one that can be accommodated with a location. Chief Robinson of the Machinery Department has received 1200 applications and can accommodate not more than 500. Other chiefs have been obliged to scale down. Chief Allison has had the most difficult problem, since he has had the greatest surplus of applications.

Some of the directors have felt that they were unduly criticised for delay because of the fact that the special building originally intended for educational exhibits was not contracted for until recently and the further fact that they have been unable to agree with the National Commission upon the adoption of a set of rules for the government of the exposition and its exhibitors. These rules for the last two months have been clamored for by intending exhibitors and especially by the World's Fair commissions of foreign countries.



PIPE AND BAR STOCK RACK.

Foreigners have been anxious to know just how much they would have to pay for power, light, heat, &c. The rules will in all probability be adopted this week.

Mr. Allison of the Manufactures Department and Dr. Peabody of the Liberal Arts Department have necessarily been delayed because of inability to provide promptly for the extra building which was conceded by the directors a few days ago. That structure will now be used for the Department of Ethnology and for housing the exhibits of the Bureau of Music, the Bureau of Charities and the Bureau of Hygienic Exhibits. It has added nearly 200,000 square feet of space to that in the Manufactures Building. Until it was known whether this extra building would be provided Mr. Peabody and Mr. Allison could do nothing definite. Since then Chief Peabody has closed up all the space for educational exhibits, and will begin next week on the bureaus.

The Great Electric Cranes.

The first to be installed of the three electric traveling cranes for Machinery Hall was made by the Yale & Towne Company of Stamford, Conn., while the other two are to come from the establishments of the Morgan Engineering Company of Alliance, Ohio, and William Sellers & Co. of Philadelphia. Each crane will be operated on a track 1400 feet long, has a carrying capacity of 20 tons and weighs about 50 tons without load. The Yale & Towne crane has two trolleys, each of 10 tons' capacity. It is operated by five motors of the United States Company's Manchester slow-speed type. One, a 25 horse-power machine, suffices for the bridge travel, while two 10 horse-power motors, one on each trolley, operate the hoists. The cross travel is taken care of by a 3 horse-power motor on each trolley. Current is taken from two No. 2 B. & S. wires by Thomson-Houston under-running trolleys. The crane can travel at the rate of about 500 feet a minute. During the fair proper it will be fitted up for the accommodation of passengers, of whom about 300 can be carried at one time. An excellent opportunity will thus be given for viewing the busy scene beneath.

New York Mineral Exhibit.

One of the prettiest structures which will be erected by New York State will be that for the mineral exhibit. Architect Isaac G. Perry has just completed the drawings for it. They call for a rectangular pavilion in pure Roman-Ionic architecture, 31 x 61 x 22 feet high. The four corners are to be surmounted by balustrades; the caps of the fluted columns are to be richly carved; there will be an ornamental frieze, and the spandrels will be decorated with mining implements worked into the ornamentation.

The structure will be of white and gold. There will be a balustrade all about the floor, except across the front. The front, or entrance, is of a concave half circle. Directly opposite the entrance an obelisk will rise to a hight of 30 feet. This will be 3 feet square at the base and taper gradually to the top.

It will be composed of rocks illustrating the geological formation of the earth as has been developed by research.

Transporting Russian Exhibits.

A Copenhagen cable dispatch says that the Russian Government has just executed a contract with the Thingvalla Steamship Company, and also another with the United Steamship Company, for transporting to America and return all exhibits from the Russian Empire to the World's Fair at Chicago. It is officially stated that the collection of exhibits from Russia will be the most extensive ever sent from that country to any international exhibition. Unusual interest is expressed in the shipment, which will probably be effected from Port Liban.

The Brazilian Exhibit.

The preliminary exhibition of exhibits at Rio Janeiro, intended to be sent by Brazil to the World's Fair, has been successfully opened, and United States Minister Conger, stationed at Rio Janeiro, predicts a fine representation at Chicago.

Pipe and Bar Stock Rack.

The Builders' Iron Foundry of Providence, R. I., have placed on the market the stock rack for conveniently arranging pipes and bar iron, here illustrated. Screwed into a cast-iron base are two pipes adapted to receive cast-iron cross pieces, which are held at any desired hight by set screws. This provides at each cross piece three shelves, if we may use the term, two outside and one between the bars, for receiving the stock. By means of this simple rack, pipes and bar iron can be arranged so as to be conveniently handled, and the spaces between the cross pieces can be so adjusted as to meet the requirements of the different kinds of stock carried. The cross pieces are made in several sizes in order to adapt the rack to large or small stock.

A New Rust Preventive.

By accident one of the members of the firm of Edmund Mueller & Mann of Charlottenburg, Germany, discovered a mixture of essential oils and greases which proved to be an excellent rust preventive. The demand led to its manufacture on a larger scale under the name of "Mannoeitin," which was adopted by a number of the German Government departments, the post office, state railroads, gun plants and regiments. It has also attained widespread recognition among private manufacturers of machinery, engines and iron and steel. The composition is a thin fluid, which is readily applied by means of a brush. In a short time the essential oils forming a part of its composition evaporate and the greases remain behind, forming a coating which protects the polished iron, steel, brass, copper, gun metal or nickel plated goods against atmospheric influences, and even against the action of sea water. The absence of acid in the composition is alluded to as an important point, nor does it enable acids to form through contact with air or water. We are informed by Vilmar & Goetze of 81 New street, New York, who are agents for this country with the exception of certain States, that the composition, while relatively costly, is economical, because a very small quantity will protect a good deal of surface. It is claimed that the composition does not turn rancid and that it can be readily removed by rubbing with cotton waste wetted with turpentine. It leaves a surface bright and smooth. It has been tested by the purchasing agent of the Illinois Steel Company, Chicago, who exposed a piece of polished steel to the atmosphere for two months, and subsequently kept the same article under shelter for the same length of time. It was then found that the article was as bright and free from rust as it was on the day the material was put on it.

A bill creating a Department of Transportation and providing for the construction of a Nicaragua ship canal has been introduced in the House by Mr. Otis. The department is to have general supervision of the carrying trade of the entire country and to exercise all the powers of the Interstate Commerce Commission, which is abolished. On his appointment the secretary of transportation is to name a commission to proceed to Central America to inspect the work done by the Maritime Canal Company and report what treaties, &c., are necessary to give the United States full control of the Nicaragua Canal.

THE LETTER BOX.

The Plumber's Apprentice.

From S. I. D., *Canada*.—I see in the December 3 issue of your paper (or our paper, I might say) that "G. B." of Newburgh and his shopmates, have been having some debates on questions of interest to the trade. He wishes to know if bosses are imposing on apprentices in keeping them three or four years in learning a trade. In my opinion, I should say not. He has probably seen boys, as I have, who, after two years of service, are as proficient in their trade as others who have put in almost double that time in the same shop, showing clearly the difference in the individuals; their ability to learn and to make the best use of their time. &c.

One of these boys, who has his business at heart, after putting in his day at the shop, will spend his evenings in advancement. If he be a tinner he will save his pocket money to buy a *Metal Worker* pattern book, and there he may learn in his winter evenings what he would be years in picking up in ordinary shop life. I know of such a case where there were a number of "joura" in the shop who, when a job of difficulty or rare occurrence came along were glad to get that same boy to help them. The other boy thinks he has done enough at quitting time, so he spends his time at the opera house, the saloon, on the street, or elsewhere, and never thinks of his business till next morning. Now, as a graduate of a trade school, I would like to disabuse your correspondent's mind of the idea that none but tin workers attend them. It is not so, and plesse tell him, Mr. Editor, that they don't all claim to be able to do tin and sheet-iron work, plumbing, steam and hot-water fitting. Men who make such claims are, I believe, ignorant of what that list includes, and so are the bosses who ask a man to do such work. Let us look for a moment at this "want ad." from the same issue of *The Metal Worker*: "At once: a good all round workman who thoroughly understands plumbing, steam heating and furnace work, and can do some tinning. A man who can do a job and will not have to go back two or three times and fix it over," &c.

This is only a sample of a good many of the same nature, is it not? If such a man is found who "thoroughly understands" these trades, it will be well to publish his name for the benefit of the trade and for the satisfaction of knowing that there are such men to be had. We will suppose a man to have served four years at plumbing, to be a good workman, understanding both the manual and scientific practice of his trade; then he goes and serves another four years as a steam and hot water fitter and becomes proficient at that also. Now, he answers an advertisement like the one before us and gets the job. He has to work at each trade alternately. I say he may thoroughly understand them both, and yet at what a disadvantage he would be if called upon to work alongside of a plumber who thoroughly understands his business and who works at it continuously.

Then again, this kind of boss, who expects so much, often asks his men to do work that is wrong. He takes a man to a job and tells him to connect up a bath and basin, &c., so and so. The plumber says: "It would not be right to put traps on the fixtures without venting them," and explains their necessity to prevent syphonage, &c. The boss replies: "Oh, bother; never mind that, we don't do that way here." And the plumber either has to refuse to do the work wrong and lose his job, or to do it wrong and have someone come along and say he didn't understand his business. In conclusion, I would say that I have nothing but words of praise for the New York Trade School and for the kind and courteous attention from all its officers.

Taking Account of Stock.

From M. U. D., *Garnet, Ga.*—The new year and the new *Metal Worker* just show up in great shape. One reminds that *tempus fugit*, and the other impresses that better ideas "fewgit" than it distributes, though the mistress advises me that if I stuck closer to metal work than to *The Metal Worker* there would "fewgit" a chance to dun me. This rather woke me up, and I'm thinking about making a fortune out of tin. You know a fortune is only an accumulation of "tin." Well, I've got a pile, but it is scrap. What else have I got that is good for something in getting that other pile of "tin?"

A lot of as good ideas as ever any man got from a wide experience and as expert a handicraft in all the workmanship of my assorted trades as a specialist in some one of them. The fact is established with the people all through my section. At a cheap rent, right in center of the town, a roomy, light store and shop with a big lot and a barn on the back of it, all of them as dingy, dirty and disorderly as a man without system, ambitions, pride and industry would have them; as incongruous a lot of stock as buying of everybody only could get together; shop as full of badly arranged tools as adding one at a time and put up in a hurry could make, and where time is lost from their being unhandy; the worst mess of odds and ends of tin plate, sheet iron, lead-pipe fittings and general stock that I ever saw; as big a pile of old stoves, old iron and trash as ever any one man kept so long without calling in the junk dealer; ladders and wagons unsheltered, because the barn is full of stuff that should not be there, or arranged to take up half the space; books badly kept and way behind; bills never sent out; everybody at the first of the year always collects prompt from good psyers, and trusts slow payers because they won't pay till they get ready; money in bank, none; in pocket less; bills for everything on the file, some with remarks on them sharper than the file; wife as good as the world holds, two smart boys and a girl that take after their mother.

Well, that would be a sorry old stock if it wasn't for the family and *The Metal Worker* ideas that I never used. I always observed the workshop laws laid down as gospel; but the best ideas are suggestions and hints; them I never heeded. I think I've tumbled to the ideas, and state my case so that some other follow whose shebang is run in the same way may tumble to them.

Well, I aint making any resolutions for the new year, but if *The Metal Worker* can suit the boys better by a change of style just look in on me when this year gets older.

Discounting Notes.

From W. H. E., *Brooklyn, N. Y.*—Will you kindly inform me through *The Metal Worker* if there is any way that I can raise money on the following note:

$460. September 28, 1892.

On or before one year after date, we promise to pay to the order of.....jointly and severally $460 at.....for value received with interest at 6 per cent. until paid.

(Signed) .....
(Signed) .....

I hold stock as security, the par value (the stock is now selling at par) of which is $4600.

Answer.—We suppose there can be no doubt that any bank would be glad to discount this note when it is backed by such good collateral. There ought to be no trouble in negotiating the paper with any one. If the parties to the note are in sufficiently good credit, the note might be taken without the delivery of the collateral, but if not, the person or bank to whom the note is sold would insist on the security being transferred. The question in the mind of our correspondent probably is whether he has the legal right to part with the stock. This depends on the agreement under which the stock was delivered to the holder of the note. Very frequently it is stipulated that the security shall not be repledged. It certainly would be dangerous in most cases to permit collateral of much more than the value of the note to be passed into the hands of an irresponsible person who might appropriate it to his own use. The owner of the stock might justly complain if this was done without his knowledge or consent. He would in such a case, we think, have a claim on the party to whom he intrusted the security for any damage he might sustain. It is our opinion that where there is an agreement that the collateral shall not be transferred, or where there is no agreement at all, where the parties are silent, the holder of the note assumes full responsibility for the collateral in case he transfers it. He must psy in case it is wrongfully appropriated. Of course, where permission is given to turn over the security with the note no such liability would attach. Unless, however, such transfer was expressly forbidden, the holder would be safe in repledging the security with some thoroughly responsible bank. It might be well to obtain, however, the consent of the maker of the note. It may be said that banks do not usually wish to discount paper which has so long to run, and in this case the situation is further complicated by the fact that the makers have the right to psy it off at any time. These are practical matters, however, which can only be settled by attempting the negotiation.

ROOFING AND CORNICE.

The Country Cornice Shop.

II.

By Cornice Worker.

DRAWING INSTRUMENTS.

It is of great importance for all who wish to do cornice work to become familiar with the use of the drawing board, T-square, triangles, and a set of drawing instruments.

The drawing board for shop use should not be smaller than about 3 feet 6 inches by 5 or 6 feet, and can be made by any carpenter. The T-square should be about 4 feet long, with a set of triangles of different angles. A brass set of drawing instruments costing from $3 to $4 will suffice. It is also convenient to have a smaller T square on hand, say about 30 inches long, to be used for small work.

In Fig. 7 is shown a drawing board with T-square and triangle, and paper attached. When using the T-square always set it on the left side, as shown in Fig. 7, and from the bottom.

Let us suppose that we have received an inch scale drawing from the architect, from which we have to work out the detail.

To work out this inch scale drawing to full size we will require a scale with which to obtain measurements. In Fig. 8 is shown a scale, 1 inch to the foot, or in other words, with the inches divided into 12 parts. Each one of these divisions, therefore, represents a full inch on the drawing, provided it is drawn to a scale of 1 inch to the foot. The same method as shown in Fig. 8 is employed when using smaller scales. If the architect's drawings were ¼ inch scale, we would divide ¼ inch into 12 parts, and each part would represent 1 inch on the full size. Although boxwood scales with the quarter, half, three quarter and inch scales upon them can be obtained as low as 25 cents apiece, it is better if we understand how to construct our own scales, in case none other was at hand.

EAVE TROUGHS.

Let Fig. 9 represent a section of hanging gutter or eave trough, with lock attached, for eaves of pitched tin roofs. These eave troughs can be made of tin, galvanized sheet iron or copper; copper, except for the cost, having the preference on account of lasting the longest and requiring no painting. The eave troughs can be made in lengths equal to the length of the cornice brake. Care should be taken that all seams are closely riveted and soaked with solder. Should copper be used for the gutter then solder the seams on the inside only, so as to leave a clean appearance on the outside when finished. Fig. 10 is a perspective view of the same gutter, showing the top braces in position. Fig. 12 shows the plan and side view of a wrought-iron gutter brace, made of $\frac{3}{16}$ x 1 inch band iron. A and B are the countersunk holes for screws. If the tinner

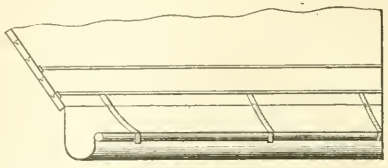

Fig. 10.—Perspective View of Gutter Shown in Fig. 9.

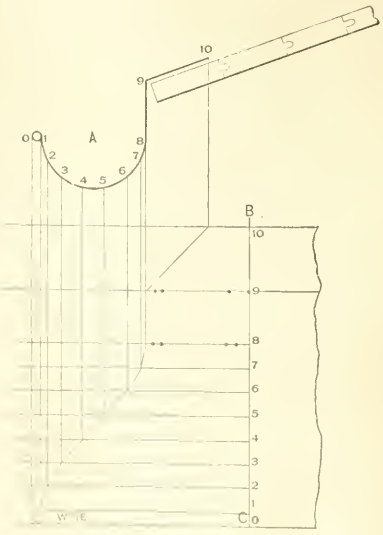

Fig. 11.—Square Miter for Hanging Gutter.

has not the service of a portable forge it is advisable to obtain one, for they are of considerable assistance for doing light iron work, the small size costing but $15. Let us suppose that the tinner has a forge, and intends to do his own wrought-iron work required for cornices, &c. In making the wrought-iron brace shown in Fig. 12, the one end is heated in the forge almost to a white heat, and with quick successive blows with the hammer is drawn out to a point, and curved according to the size of the rod used in the edge of the gutter. As some tinners have no forge, this work can be done by the blacksmith, or the drop the brace on the roof and drive the point C, Fig. 12, well around the wire A, Fig. 9, and put the two wood screws in each brace, thus completing the work of setting the gutter. The tin following is now locked in the gutter, as shown in Fig. 9.

Fig. 13 shows another form of hanging gutter or molded eave trough with leader attached. Fig. 15 gives an enlarged view of the eave trough shown in Fig. 13, also the method of obtaining the pattern for square return miter.

Let A, Fig. 15, represent the end of any molded gutter, for which we desire to

THE COUNTRY CORNICE SHOP.

gutter hangers may be obtained from dealers in tinners' supplies. The holes in the braces can be punched by hand and countersunk with breast drills, which can be purchased from any hardware dealer In putting up the gutter shown in Fig. 9 (the bending of which will be described later on), after having the pitch bent on it and the lock attached, take a few roofing nails or 1-inch wire nails, bend up the lock every 2 feet, and drive in a wire nail. Now replace the lock in the first position, and we are ready for the braces. The braces should be placed about 3 to 4 feet apart, according to the size of the gutter. Take a small chisel and cut a notch underneath the wire, as shown at A, Fig. 9, and slip in the point of brace shown at C, Fig. 12. Next obtain a square return miter head. Divide the mold A, Fig. 15, in any number of equal parts (the more parts, the more accurate the pattern), as shown by the numbers 1, 2, 3, 4, &c. In line with the back of the head of the gutter, as shown by B C, Fig. 15, draw a line, as shown by D E, upon which lay off the stretchout or actual length of profile of the mold A, Fig. 15, as shown from D to E. To illustrate what is meant by the stretchout, let us take a strip of tin or zinc, say about ¼ inch wide, and bend it to the same shape as the profile of the mold A.

Now flatten out the strip and we have what is called the stretchout, corresponding to the stretchout line D E, Fig. 15. At right angles to the line D E draw lines from the small numbers, as shown, which intersect with lines drawn from the mold A of corresponding numbers, or in other words, have the line 1 of mold A intersect the line 1 of stretchout D E, the line 2 of mold A intersect with the line 2 drawn from the stretchout D E, and so on. A line traced through these intersections, will be the required pattern for a square return miter head, as shown in Fig. 13.

The method just shown is the short rule for obtaining patterns for square return miters only, or those having an angle of 90°. If the angle was more or less than 90°, the plan and miter line would have to be employed for obtaining the pattern, the method of which will be fully explained in the next chapter.

LEADER ELBOWS.

In making galvanized-iron leaders, no lighter gauge than No. 26 should be used. If a good strong leader is required, it is advisable to place the rivets about 2 inches apart, using 2 pound tinned rivets and placing washers or burrs on same; this makes a strong leader, and by using the washers, the rivet heads require no soldering. The leader can also be double seamed, but I prefer a riveted leader. Copper leaders are made in the same way. When making leaders of tin, it is advisable to use lead plate and groove them. Brass mounted grooves can be obtained as low as from $8 to $12. In Fig. 13 is also shown a round leader, which requires two bends to bring it plumb against the wall. As the portions of the leader marked B and C run parallel to each other, the two angles or miter joints D and E will be the same as shown in Fig. 13. Fig. 14 is an enlarged view of one of the angles of the leader shown in Fig. 13. After placing the angle or bevel which we desire the leader to have, as shown by C D, Fig. 14, and taking the width of the leader with the dividers, we lay off this diameter or width, as shown by E F and G H, at right angles to E M, and I J and K L at right angles to M D. Then draw lines through F H and L J until they intersect at X, as shown. We now draw a line through M and X, as shown by A B, and we have what is called the miter line. To prove the accuracy of the miter line A B, proceed as follows: Placing the point of the compass at M, Fig. 14, strike an arc, with which intersect the line C M and M D, as shown at the intersections N and O. Next place one leg of the compass on the point O, and with radius greater than O M strike an arc as shown by P U, and similarly from the point N as center strike an arc, as shown by P U, intersecting the arc struck from the center O. A line drawn through these two intersections P and U, and corresponding to the line drawn through the angles M and X, will prove the accuracy of the miter line. What we have just done is simply giving the description of the definition of the geometrical problem called "bisecting any given angle," In making any elbows or other form of molding it is only necessary to draw the correct bevel or angle and then bisect it to get the miter; or in other words, cut the angle so that when the portion of the pipe K L M X is turned over on the line M X it will correspond to E F M X, as shown in Fig. 14. We will now describe how to obtain the pattern of the elbow as required in Fig. 13. Let A, B, C and D in Fig. 16 represent E, F, M and X of Fig. 14 reversed. The miter line C D, Fig. 16, being correct, draw the profile or section of the leader, as shown at F, Fig. 16, and divide into an equal number of parts, as shown by the small numbers 1, 2, 3, 4, &c. Parallel with the lines of the pipe A C and B D, drop lines until they intersect the miter line C D, as shown. Now at right angles to the lines of the pipe A C or B D draw the stretchout of

the profile F, as shown by the small numbers on the line E F^1. The stretchout is the length of the circumference of the pipe, stretched out straight. At right angles to the stretchout line E F^1 draw lines from the small numbers 1, 2, 3, 4, &c., which intersect with lines of corresponding numbers, drawn from the miter line C D, at right angles to the lines of the pipe A C or B D. A line drawn through these intersections will be the desired pattern for one portion of the elbow shown in Fig. 13.

SQUARE RETURN EAVE-TROUGH MITER.

Suppose that the gutter, Figs. 9 and 10, were to return around the corner of a building the angle of which was square, or what is the same, an angle of 90°, and let Fig. 11 represent an enlarged view of Fig. 9. To obtain the pattern proceed as follows: Divide the profile A into any number of equal parts, as shown by the small figures 1, 2, 3, 4, &c., from which drop vertical lines, as shown. Parallel with the vertical lines draw the stretchout line B C of the profile A of Fig. 11, as shown by the small figures 1, 2, 3, 4, &c. At right angles to the stretchout line B C, Fig. 11, draw lines which intersect with lines dropped from the profile A of corresponding numbers. A line traced through these intersections will be the required pattern. The small dots shown on the lines of the patterns in Figs. 11, 15 and 16 indicate the bends. The double dots shown on the line 8, Fig 11, indicate where the circle stops, as shown on the profile A, space 8.

National Iron Roofing Association.

The seventh annual convention of the National Iron Roofing Association began at 10 a.m, January 11, at the McClure House, Wheeling, W. Va. The first day's session was devoted to a discussion of matters pertaining to freight charges and classifications. The World's Fair exhibits of iron roofing and kindred products was also considered at length, and considerable time was given to a consideration of the methods of production and the questions of weights, gauges and measurements. Various committees were appointed, among which was a special one appointed to visit Washington and bring before Congress the desirability of a uniform system of weights and gauges to be used as a basis in levying duty on goods of the sort handled by these manufacturers. On Wednesday evening a banquet was held at which 60 covers were laid, and was attended by all the members present as well as a large number of rolling mill representatives. On Thursday unfinished business was taken up and the officers elected for the coming year, the election resulting as follows:

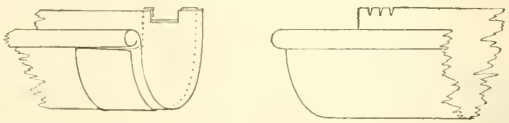
President, C. H Conner.
Vice president, James Hicks.
Secretary and treasurer, R. J. Hyndman.

The rest of the day was spent by the members in visiting manufacturing establishments in Wheeling and vicinity.

THE SLATINGTON-BANGOR SLATE SYNDICATE is the title of an organization perfected on Monday, January 2, and briefly referred to in our columns last week. From an explanatory circular which has been issued to the trade, we learn that it is the purpose, among other things, of the organization to purchase and market the output of the best quarries in the Bangor and black slate regions. The management of the organization is in the hands of James L. Foote, for the past six years connected with the Slatington Slate Company, while the treasurer is Joel Neff, for many years past favorably known as an extensive slate manufacturer. The syndicate represents over 20 quarries. Yards and slate centers will be established at four or five of the principal cities of the country, where roofing slate will be always carried in stock and promptly shipped to points required. We understand it is the expectation to market 100,000 squares during 1893 and 600,000 feet of blackboards, to be largely increased in following years. It is said that the syndicate is in no sense a trust, monoply or combination, but a business arrangement for the purpose of marketing slate on a business-like basis.

The Never-Slip Eave Trough.

Bowers, Galpin & Co., Binghamton, N. Y., are introducing a new eave trough called the Never Slip, which is illustrated in the accompanying engraving, the cut showing the trough separated at the joint. The construction, on which a patent is pending, is very simple and will be readily understood from an inspection of the engraving. As will be seen, one end slips in the socket and then the ears or clips next the eaves are bent front and back and hooked over the two sides of the slot, making the joint fast. A principal feature to which the manufacturers direct attention is that the Never-Slip is made by machinery and the fold is close up to the body of the trough, with just space enough so connecting sections slip up snug and make a flat and smooth joint. This construction by machinery does away with the open joint and the necessity of filling it with putty or cement. The Never Slip eave trough will be of interest to all who require a trough that can be put up without soldering.



The Never-Slip Eave Trough.

FLASHINGS.

THE NEW YORK IRON ROOFING & CORRUGATING COMPANY, First and Washington streets, Jersey City, N. J., send us a copy of a circular letter which they have distributed to the trade. It relates to the advantages possessed by the company for the proper conduct of their large and growing business, and to the new officers, who are practical metal manufacturers and are also at the head of the Penn Iron Roofing & Corrugating Company, Limited, of Philadelphia. The management of the New York company is under the direct control of E. P. Hoyt, formerly the secretary and superintendent of the Philadelphia concern, and originally for two years connected with the New York company under the old management.

JOHN F. SNYDER & Co. of Philadelphia, who have for the last six years carried on the sheet metal cornice business at 2314–2320 North Eighth street, in that city, inform us that increase of business has necessitated their making an extension of facilities in order to keep abreast of their work. They are accordingly now putting up a large new brick factory 115 feet long by 70 feet wide and two stories high, fitted with steam power and a quantity of new machinery. They hope to have it in operation by April 1. When complete, it is stated, the new building will be one of the finest cornice-making establishments in the country. Snyder & Co. have also leased a three-story building at 2511 North Broad street, Philadelphia, which will be used henceforth as their main office, as well as for the manufacture of metallic skylights.

H. B. TODD, Meriden, Conn., manufacturer of Yankee eave-trough hangers, has gone to Florida for the cold season. Mr. Todd will combine business and pleasure on the trip.

JOHN W. BELL & Co., Mercer, Pa., furnish a circular relating to the Bell eave-trough hanger and Bell's malleable roof-iron and wire fasteners, of which they are sole manufacturers.

R. T. NEWLAND announces that he has opened a tin shop at Mt. Jackson, Va., where he is prepared to furnish tin, steel and sheet-iron roofing.

THE AMERICAN ROOFING COMPANY, St. Louis, Mo., and Cincinnati, Ohio, report a steady trade for the lines manufactured by them. They advise us that the present year shows considerable increase over the business transacted during 1891, and the outlook for spring trade is particularly encouraging. During the past year they have improved their plant to the extent of several thousand dollars, and are now, and have been for some months past, able to handle the largest contracts offered.

IN *The Metal Worker* last week we printed a short table giving the amount of slate handled by the Vermont Slate Company during the past four years. The amounts, however, were erroneously given in dollars; the figures we printed should have been for the number of squares. That there may be no mistake in this we reprint the statistics:

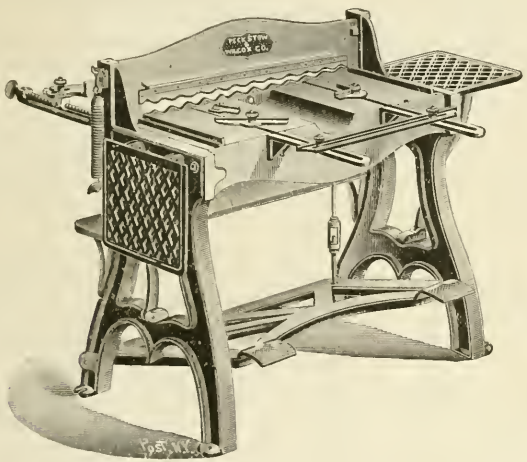
	Production. Squares.	Shipments. Squares.
1889	138,662.45	115,339.86
1890	152,958.45	178,304.04
1891	189,698.57	187,356.54
1892	201,527.19	192,997.24

GEORGE C. KEENE & Co., 140–150 E. Front street, Cincinnati, Ohio, owing to the continued increase in the demand for sheet metal roofing machinery, the production of which they make a specialty, have secured 10,000 additional square feet of floor space at the above numbers, divided into three rooms, the first of which will be used as a stock room for finished machinery such as cornice brakes and light tools, the second will be fitted up with additional machinery especially adapted to the production of small sheet metal working tools, while the third room will be used almost exclusively for the storage of patterns. A number of additional hands will be added. Several large contracts for iron roofing machinery outfits are now under way.

A VERY CREDITABLE PIECE of sheet-metal work has recently been completed in the warehouse of Tefft, Weller & Co. of this city by Lyles & Mills of 231 William street, New York. The basement of the building has been provided with a new ceiling, the center being formed of single-reeded sheets, with a border of double-reeded iron, having the cove cornice and molding in keeping with the remaining portion of the design. We understand that the area covered is 16,000 square feet. The first floor ceiling of the building is laid with embossed plates, with cornice and moldings so disposed that the entire area covered forms one design.

THE WORKS, with stock and machinery, of the Caldwell & Peterson Mfg. Company, at Wheeling, W. Va., were totally destroyed by fire on the morning of the 2d inst. The firm announce that they have made arrangements for duplicating their machinery and expect in a short time to be able to fill all orders promptly. Through the assistance of other manufacturers they are prepared to make prompt shipments of corrugated iron roofing and siding, V-crimped iron roofing and pressed standing seam iron roofing. The firm propose to rebuild at once on a larger scale than ever before, and work on the erection of their new plant will be pushed as rapidly as possible.

L. L. SAGENDORPH of Philadelphia, Pa., has been granted a patent for a metallic ceiling plate having a raised margin or molding on each side, the molding at the corners extending out beyond the margin of the plate. In placing the plates in position on a ceiling, the projecting portions overlap the two marginal beads on adjacent plates, and the corners thus formed are covered with rosettes. The latter are retained in place by a single nail driven through each of them and through the overlapped portions of the moldings at their intersecting points. A one-half interest in this patent has been assigned to Charles N. Harder of Philmont, N. Y.



Squaring Shears for Cutting Corrugated Metals.

Squaring Shears for Cutting Corrugated Metals.

The Peck, Stow & Wilcox Company, Southington, Conn., and 27 Chambers street, New York, have recently commenced the manufacture of squaring shears for cutting corrugated sheet metals of any description, particularly such as are used for roofing, siding, &c., the blades in each instance being made to fit the corrugation intended to be cut. In changing the corrugation it is obvious new blades must be supplied to correspond. So far this application is confined to the heavy No. 0130 squaring shear here illustrated.

Detroit merchants are securing pledges to the amount of $125,000 for a chamber of commerce building.

Only one full-rigged ship was built in Maine last year.

Delivery in Sales of Goods.

The delivery of goods sold is generally the first thing to be done on the completion of a contract of sale after the purchaser has performed any conditions precedent incumbent on him, and it is a very important matter in many respects. Of course, what is here meant by delivery will be understood to be such an act under a contract of sale as will satisfy the law and exonerate the seller in that regard. It may be actual, symbolical or constructive delivery. A symbolical delivery occurs in such a case as where the key to a room or building containing the goods is handed to the purchaser with intent thereby to deliver the goods themselves. Constructive delivery usually occurs where the nature of the property is such or it is in such a place that actual delivery is at the time impossible. Then it is sufficient if such delivery be made as the circumstances will permit. Illustrations are found in very bulky or heavy articles, logs in a boom, or goods at sea. As a rule the delivery is sufficient and title is vested in the purchaser if the contract of sale is completed and the property sold is set aside, or depostted, or marked as sold, at the request of the purchaser, who may take manual possession thereof at any time when he desires to do so. Especially is this true where he has paid the price. In other words, that is a sufficient delivery which puts the goods within the actual reach or power of the buyer, with immediate notice thereof to him.

Unless otherwise specified in the contract of sale, the place where the article is manufactured or offered for sale, as the case may be, is the place of delivery. Where the buyer lives at a distance from the seller he must send the goods as directed by the buyer, or if no directions are given, then as usage or reasonable care would suggest, taking all customary and proper precaution to prevent loss or injury in transit. In such case delivery to the carrier is delivery to the purchaser in contemplation of law if the goods are consigned to the purchaser, otherwise if consigned to the seller and he retains the bill of lading. But under a contract of sale whereby the seller is to deliver the goods at a particular place, the carrier selected by him is his agent to deliver, for whose acts he must be responsible. And when goods are contracted to be sold upon condition that they shall be delivered at a particular place, they are subject to attachment at the suit of the creditors of the seller until they are so delivered.

Where a time is agreed on for the delivery to take place, it must be at that time. Until the time for their delivery arrives, goods are subject to the attachment of creditors of the seller. Shipment before the time specified will not pass title. If no time is mentioned in the contract of sale, a reasonable time will be understood to be meant. And if there are conditions precedent to be performed by the purchaser, they must be performed before the seller will be obliged to make delivery.

Many of the principles underlying this subject are very clearly set forth in the leading case of Bloxam *vs.* Sanders, in which it is stated that where goods are sold and nothing is said as to the time of delivery or the time of payment and everything the seller has to do with them is complete, the property vests in the buyer, so as to subject him to the risk of any accident which may happen to the goods, and the seller is liable to deliver them whenever they are demanded, upon payment of the price, but the buyer has no right to have possession of the goods till he pays the price. The seller's right in respect to the price is not a mere lien which he will forfeit if he parts with the possession, but grows out of his original ownership and dominion, and payment or a tender of the price is a condition precedent on the buyer's part; and until he makes such payment or tender he has no right to the possession. If goods are sold upon credit, and nothing is agreed upon as to the time of delivering the goods, the purchaser is immediately entitled to possession, and the right of possession and the right of property vest at once in him. But his right of possession is not absolute; it is liable to be defeated if he becomes insolvent before he obtains possession. If the seller has dispatched the goods to the purchaser before he has paid for them, and insolvency occurs, he has a right, in virtue of his original ownership, to stop them in transit. Why? Because the property is vested in the buyer so as to subject him to the risk of any accident; but he has not an indefeasible right to the possession, and his insolvency without payment of the price defeats that right. And if this be the case after the seller has dispatched the goods, and while they are in transit, by so much the more is it where he has never parted with the goods, and where no transit has begun.

A failure to deliver goods at the time and place agreed on will justify the purchaser in refusing to accept them at all. And where delivery is in parcels or at different times, but the whole is not delivered, the purchaser may return the part delivered. The seller cannot compel the purchaser to accept a less quantity than his contract calls for, but if he fails to make delivery according to contract he can recover for what he has delivered, less the damage sustained by the purchaser, unless the latter restores to the seller what has been delivered. So if a greater quantity of goods than the contract specifies are tendered or delivered the purchaser may refuse to receive them or more than he purchased.

Purchase of goods without delivery thereof leaves the apparent title still in the former owner. Consequently, where a person bought an article, paid for it, and its delivery at another date and place was agreed on, and the former owner on the same day sold it to another person, it was held that there was no such delivery to the first purchaser as to pass title and protect him against an innocent second purchaser.

The financial crisis in Australia seems to be more acute. Failures are numerous.

"The Metal Worker" Competition in Skylight Pattern Cutting.

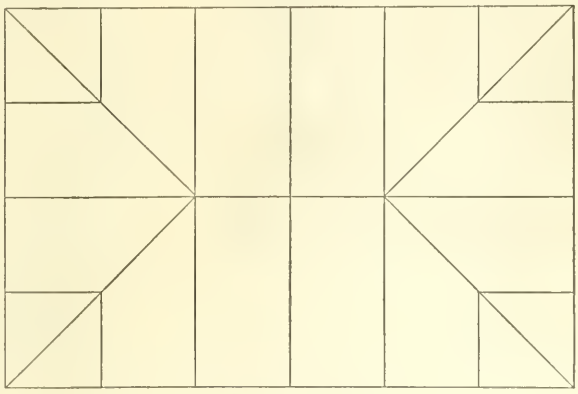
FOR the purpose of calling forth from the readers of *The Metal Worker* the best method for obtaining the patterns of a hipped sheet-metal skylight and to advance the art of pattern cutting, it has been decided to present a prize competition, the particulars of which are as follows :

Each contestant will be required to furnish the plans, elevations, necessary sections and profiles of skylight, also to design the various parts of same, giving to each part the shape that may be considered best adapted for the purpose ; drawings to be of such size as required for publication in *The Metal Worker*.

The skylight to be so constructed that the condensed moisture from below will be conveyed outside, the frame work of skylight to be made of sheet metal, and the usual thick glass to be used in connection with same; the method of securing glass and caps to bars or rafters to be clearly shown.

While the plan may show a certain size of skylight, indicate the method by which one of similar pitch but different size can be constructed, the same miter patterns being used.

Show method of obtaining length of the various bars or rafters, using for the purpose any diagram, plan or elevation that may be necessary. Also show method of obtaining shape or section of hip bars.



Outline Plan of Skylight.

The skylight for which the patterns are required is such as would be placed over a light shaft, or on a roof or bulkhead, the size of opening being about 4 x 6 feet. As there is no particular rule governing the pitch of the skylight, it can be given such pitch as may be desired. While the wooden curb or frame of air shaft, roof or bulkhead is supposed to extend a sufficient distance above the roof to give ample opportunity for securing skylight to same, contestants will be at liberty to use such methods as appear best adapted for the purpose of fastening skylight, where brick and angle iron constitutes the frame.

The accompanying plan is not intended to give details of construction, but to indicate in a general way the shape of skylight for which drawings and patterns are required. Where there are two or more similar parts in the skylight, so that the pattern for one part will answer for the other, it will be only necessary to show details of one part. As indicated in plan, the skylight is to have a hipped roof, and as previously stated, the roof can be given any desired pitch.

PRIZES.

In the contest above described, two cash prizes are offered, as follows :

First prize.....$75.00.
Second prize..... 50.00.

The drawings and accompanying description may be sent by either mail or express, charges prepaid, and must reach the office of *The Metal Worker* not later than April 1, 1893.

They are to be addressed as follows :

THE METAL WORKER,
96–102 Reade street, New York.
(Skylight Competition.)

Each contestant is to select a fictitious name or device, which is to be placed on the description and each sheet of the drawings. The real name and address of the writer is to be put in a sealed envelope, on which is to be placed the fictitious name or device used on the drawings. This envelope is to be inclosed with the drawings and description.

The manuscript and drawings are to be sent flat, not rolled, and the writing should be on one side of the paper only. It is also suggested that legal cap paper be used for the description, the same size of paper for the drawings, and that ink be used for writing the descriptions ; the drawings to be either ink or pencil.

The various drawings and descriptions received up to the time set for closing the competition will be submitted to a committee selected for the purpose, who will decide between competitors.

In deciding between contestants, four points will be given consideration, as follows :

1. Originality.
2. Mechanical completeness of the method proposed.
3. Neatness of drawings submitted.
4. Clearness in description.

The right is reserved to publish all the drawings and descriptions received in this competition, and also to return to the authors the drawings and descriptions received in the competition in case they are not considered suitable for publication or worthy of an award of prizes.

Hardware as Specified.

THIS TERM COVERS "a multitude of sins," as it is almost universally used by the architect in making up the plans for buildings. It is all right that such an expression be used and the specifications may make the work of estimating an easy task easier. The trouble lies in the fact that while the specifications are quite explicit as regards the wood work, the masonry, &c., in all probability a page will be devoted to Hardware and will read something after this manner:

HARDWARE SPECIFIED.

"Hardware to be of good quality"—that's definite—"and bronze on first and second floor; attic to be trimmed with rim locks and jet knobs; front and vestibule doors to be supplied with first-quality interchangeable key locks"—each maker has a first-quality lock. The balance of the page in reference to Hardware is devoted to sash pulleys, shutter butts, window fasts and other minor details, but never a word to enlighten one as to the grade, style or quality of goods to be used throughout the house. It therefore rests with the estimating party to decide what is right and proper for general application where no rules are laid down; and with this state of affairs, the floor plans and elevations before us, we will take the place of the estimating clerk and start in to trim.

THE BASEMENT.

According to the plans, there is an entrance door leading to the street. Obviously this door must have a good lock, and if the best lock is used on the main entrance, then this lock should be equally secure. To this door we will apply a mortise flat-key vestibule latch. In all probability there will be an iron gate used outside, but it does not show on plans. Specifications do not say. Now there is the back door leading to the yard. This door does not need so expensive a lock as the front one, but we will use a three-tumbler 5-inch mortise bit-key lock here, bronze knob outside and black iron inside, and a combined escutcheon plate outside, as we did on the front-door lock. Left to our own decision, we will use 5 x 5 butts, solid bronze, for these two doors, and the remaining basement doors we will trim with 4 x 4 iron butts. We take it for granted that the doors are light, and that baseboard molding is very thin. As for locks for the other doors, 4-inch mortise key plates and plain knobs should be the proper trimming. But here is the pantry door: what shall we put on this door? Must it be secure? Off we go again in the dark and trim the pantry with a flat-key dead bolt, a pair of knobs operating a spring latch. Our competing neighbor may use a cheap mortise lock. At this point we are again brought to a halt, and try and solve the question as to whether the cupboard doors are rabbeted or plain, as it makes quite a difference in the cost, but to be on the safe side we will use rabbeted locks. In the laundry the washtubs need butts and lifts, but we will leave that for the carpenter to trim, as well as seat in toilet. The toilet door we will trim with spring latch and small dead bolt operated on inside by thumb piece. The windows we will trim with a cheap fast and hook lifts, as cup lifts are not made for use in the case where servants with wet hands need to lift a window. The dumb waiter to butler's pantry we will also trim with hook lift, for the reason given before. Having finished the basement, we turn the plans and start the work on

FIRST FLOOR.

The main entrance door is the first to receive attention and we supply our best front-door locks, 5½ x 5½, or 6 x 6 butts, keys to pass front and vestibule locks, as this for a wonder was mentioned in specification, but at this point we stop. How about the escutcheon, hinge plates, dummy trimming, push button, &c., &c.?

We solve this problem, but in a very unsatisfactory way, by simply trimming the active doors in plain bronze or brass, and trust that we can adjust the other matter, provided we get the order. It is not safe to estimate $50 for front and vestibule trimming, while our competitor uses plain bronze and as little of that as possible. Of course we might have asked the architect about this—that is not the point—we might ask about 50 other details which should all be explained in the specifications. The doors from main door to parlor, to library, to dining room, are all double sliding doors—are they to be hung overhead or to have brass sheaves and way? The most approved style is to hang them, so we'll use hangers, and as we do not know whether locks are wanted or only pulls, we use the locks to be again on safe side.

From the plans it is impossible to tell whether butler's pantry door is double or single acting—how easy it would have been for the designer to have shown this by using his compass and indicated, so all might read, by means of a half or quarter circle? We will run the risk and use a double-acting butt, even if it does increase the amount $10. We finish the rest of the floor in the regulation way, as the minor trimmings do not signify much one way or the other, except for those windows to the porch. Are they rabbeted or plain? Again we overlook the cost and use the figure for rabbeted locks, and trust the other man will do the same. Cupboards, closets, &c., we trim in regulation style, and again turn the plans to the

SECOND FLOOR.

The specifications said bronze here, so we will proceed to trim the chamber doors with 4½ inch mortise locks, 4½ x 4½ loose-pin butts, combined escutcheon plates and plain bronze knobs. On the closets we will modify the trim by using escutcheons on outside only. For the bathroom we will use a lock similar to the other door locks, but add a dead bolt and thumb piece for inside operation. We cannot tell from plans whether the square window in bath is hinged, pivoted or lift; we will suppose it is pivoted, and furnish pivots and an adjuster, say 12 inch in length. From the plans we imagine that inside blinds are to be used; accordingly, we furnish butts, flaps and shutter bars throughout. If we are mistaken in this supposition, then we have increased our figures to such an amount that our chances for success in getting the order are very slim, as small butts and flaps are very expensive. Trimming the windows on this floor is very simple, only an ordinary fast and flush or cup lifts, two of the latter to each window. Having finished this floor, we now turn to plan of

ATTIC.

Rim locks, jet knobs, and properly black iron butts here; butts 4 x 4, and small key plates black iron, or more properly speaking, Bower-Barff. All the closets we will trim the same as the chamber doors, except we will use half pairs of knobs. The lumber-room door we will trim as we do the other doors, but will add a flat-key dead lock, as this door may require security. Lastly we trim the hatch to roof with a pair of 3 x 3 butts, a hook and staple and a scuttle chain. This completes the trimming all but a few small pieces; these being closet hooks, door stops, &c. We now check back our work to be sure that nothing has been omitted, and finding we are right we proceed to figure up the amount. A glance over the work convinces us that it would be impossible to cheapen the trimming in any way and have the house trimmed as it should be; therefore, when we find the amount to be, say, for example, $540, we feel confident that we are right. We send the plans to the architect, and by mail inform him of the amount as found.

THE RESULT

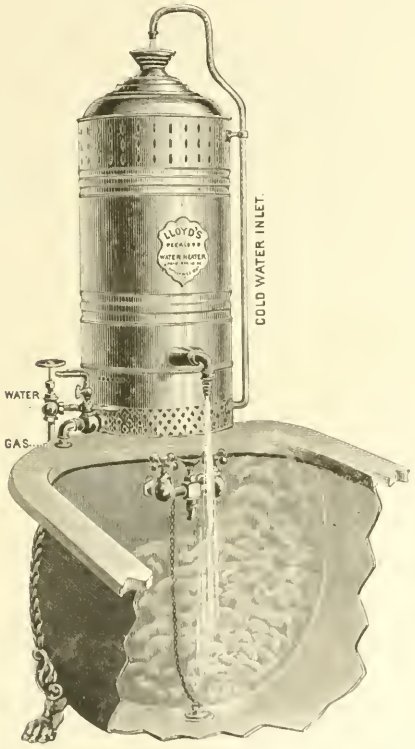
is that we get no reply and never hear of the matter again until, by chance, in passing, a call is made on the designer, and in answer to the question as to what disposition was made of the "Doe Residence," he replies, with a smile, "Why, we gave the order to Lox & Nobs; they were over $100 less than you." Here we are curious to find out what sort of trimming is being used that cost $100 less than the trim we would have used, and just for satisfaction sake we run to the town, nearby, and look over the residence. They are not using a butt in the house that is over 4 x 4, except on front door; they are using one tumbler locks all alike; there is not a door or window rabbeted, nor a piece of ornamental trimming being used. The successful party has used the cheapest, meanest kind of Hardware. The owner is pleased at the small cost. Will he be pleased with the wear and appearance after a year has passed? Would it not be better if the architect were more explicit in his specifications, thereby giving each one estimating a fair chance? Would it not tend to freeze out that class of tenement house Hardware manufacturers who are a constant drawback to reputable houses whose names are synonymous with high class goods. The firm that always get the order because their estimate is lower than their competitors' and the architect who always gives the work to the lowest bidder, irrespective of quality, together do a great injury to the owner, to the trade and to the general advance of art in this direction.

PLUMBING AND GAS FITTING.

Registration of Plumbers in New York.

Attention was drawn in *The Metal Worker* of the 24th ult. by Edward Murphy of this city to the failure of Mayor Grant to comply with the provisions of a law passed by the Legislature and signed by the Governor in May, 1892, in relation to the registration of plumbers and the supervision of plumbing in New York and other cities. The law, if we mistake not, is mandatory, and the leading master plumbers of this city who have for several years past conducted on their own account, with the concurrence of the Public Works Department, a system of examination of applicants for plumbing licenses, are desirous that the law should be fulfilled and the proper legal status be secured to those of the trade who stand ready to comply with its provisions.

In the communication referred to the writer expressed his belief "that the attention of the Mayor had been called to this business, but beyond referring it to the Counsel to the Corporation no action had been taken." A representative of *The Metal Worker* visited the office of Corporation Counsel Clark during the week, and diligent search by one of the assistants failed to find any evidence of the bill having been referred at any time to the law officer of the city government. The only possible color for such reference, it may be stated, would be the fact that changes made by another statute about that time creating the Building Department might in some measure affect the carrying out of the enactment. There is now no such officer in the Board of Health as a Chief Inspector of Plumbing and Drainage, that bureau having been withdrawn from the board and attached to the Building Department. The bill, however, provides for such a contingency, the substitution of other officials being permitted. The subject, therefore, demands prompt attention from Mayor Gilroy so as to provide the necessary means for legal registration before March 1, 1893.



The Peerless Water Heater.—Fig. 1.—View of Heater Attached to Bath.

THE WALCOTT-HURLBUT COMPANY, manufacturers and jobbers of plumbers' supplies, 175 and 177 Lake street, Chicago, furnish the plumbing fixtures for the Chamber of Commerce, Portland, Ore., the plumbing and marble work for which will require an outlay of $22,000. The toilet rooms are to be finished in marble with nickel-plated fittings, and the Dececo water closets and Puro basins will be used exclusively. J. F. Shea of Portland does the plumbing work.

The Peerless Water Heater.

The Toronto Steel Clad Bath & Metal Company, Limited, 123 Queen street east, Toronto, Canada, with United States factory at Detroit, Mich., have brought out the Peerless Water Heater (Lloyd's patent), general and sectional views of which are shown in the accompanying illustrations. Fig. 1 is a general view of the heater attached to the end of a bath-tub delivering a stream of hot water, and shows the outside appearance of the device. The apparatus illustrated is for gas, and uses either coal gas, water gas, natural gas or gasoline gas from gas machines. The capacity is 1 imperial gallon per minute raised to 180°. The apparatus is made in three styles at varying prices. The sectional view shown in Fig. 2 illustrates the operation very clearly. The water, being turned on at the supply cock, passes in the coil K at J. Then upward through the pipe on the outside of the heater and discharged into the chamber I through the strainer L. From here it is conveyed by means of spirals G on to the cone C. These spirals are 187 in number, and are connected at the top or open ends to the crown sheet H, while the lower ends connect to the skirts E and F. The water from the cylinder D is discharged through the pipe N and mixes with the air passing over the cone C before issuing at the cock M. The temperature of the water can be regulated as desired by opening or closing the cold-water supply at J. The gas burner is lighted by a pilot light which ignites the gas at the jets B, the flame passing up through the cone C and coming into direct contact with the bottom of the cylinder D. The surface of the cone C reflects the heat to the coil K under the jet, and, it is said, raises the temperature of the water fully 10 before it enters the heater. The ascending heat after passing the bottom of the cylinder D comes in contact with the spirals.

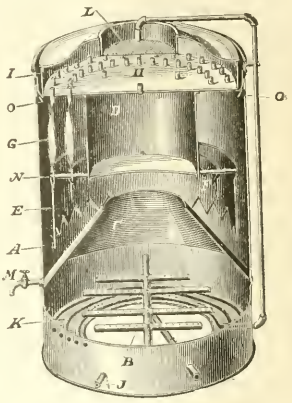


Fig. 2.—Sectional View of Heater.

The Canadian Plumbing Trade.

A correspondent in Montreal, Canada, writes in reference to the plumbing business, in which he is engaged: Volume of business about the same as last year, but competition is worse than ever. More little jobbing shops, which are now to be found in nearly every block. For this reason profits are less. The general public are asking estimates from a number for petty repairs. Nor are profits likely to improve. The worst feature in the trade here is the wholesale dealer selling direct to the consumer in small lots at wholesale prices. Then the consumer either hires a journeyman out of work or supplies the small jobber, who is without capital or credit, with material, and pays him so much per day to do the work. I can't prove it, but feel morally certain that numbers of the journeymen work at night for such people. It is a killing business for men who want to do business on respectable, above-board business lines. Many of the small jobbers are men who cannot earn a decent wage in a good shop, who go about doing repairs, their only stock or capital being their kit of jobbing tools.

Water-Closet Floor Connections

From C. S. P., *Waterbury, Conn.*—I am doing a job of plumbing in a new house here, where washout closets flushed by means of cistern and pull to be set after the most approved sanitary fashion are called for. The architect requires that I must use brass floor plates, and as I am not familiar with this method of connection I ask the assistance of *The Metal Worker* in preference to publishing my ignorance to any of my brother craftsmen. Will you explain the necessity of such a connection and how I should go about it? Also, what is the object of this new fad of the architect?

Answer.—We will begin with the last query. The purpose of a floor-plate connection for water closets (washout or other styles), which are made with bowl and trap in one piece, and necessarily set above the floor, is to guard against the admission of sewer gas through a defective joint where the lead soil pipe under the floor and the closet are connected. In some cases the method of setting these closets is to flange over the lead soil pipe on the floor and screw down the closet with a gasket of putty between the closet and the floor. But this is not a safe way, as shrinkage of the flooring, which is almost always certain to occur, will serve to dislodge the connection, and the trap being above the floor the seal which it would otherwise provide is rendered of little or no value. To make a sure rest for the closet no matter how the floor may shrink or warp a floor plate is necessary. This plate, which has a 4-inch opening, is set in the floor and the edge of the lead soil pipe is flanged over on the counter sunk edge of the opening. The closet is set on this plate with a gasket of either red lead putty or rubber between and screwed tightly together or to the floor, as the case may be. Some of these floor plates have the inner edge beveled instead of counter sunk and in such cases the connection between the floor plate and the lead soil pipe is made not by flanging over but by cutting the soil pipe flush with the surface of floor plate and filling the beveled space with solder, then setting the closet with the gasket as above. The floor plates having the bolts projecting upward are considered the better sort by some because of the fact that the bracing of the closet and the soil pipe is independent of the floor and they are not affected by the shrinkage of the wood.

Brooklyn Master Plumbers.

The following are the officers elected by the Brooklyn Master Plumbers' Association for the year 1893:

Thomas H. Radcliffe, president.
John H. Read, vice-president.
William J. Gault, recording and corresponding secretary.
John W. Kelly, financial secretary.
George B. Lewis, treasurer.
T. Dunn, marshal.
John J. Keenan, sergeant-at-arms.

Boiler Connections.

From W. F. T., *New York.*—In *The Metal Worker* of the 7th inst. "Young Mechanic" submits two sketches of how to connect kitchen boiler with water back in range, in one of which, Fig. 1, the cold-water supply pipe from boiler is about on a level with the water back, while in the other, Fig. 2, it is below the boiler, necessitating the forcing of the cold water upward. In deciding the merits of the two plans as to which is the correct one, you very properly give the preference to Fig. 1, but in doing so you condemn the other as being in contravention of natural law, by which cold water is supposed to descend while hot water ascends. I fail to see where there is anything consistent with natural law in the ascent of cold water in pipes when the necessary pressure is supplied. In Fig. 2, as well as Fig. 1, that pressure is provided, and there is no reason why a boiler set so that the cold water supply is a few inches below the water back should not work satisfactorily, provided always that such pipe, as well as the hot-water pipe, is not trapped. There are very many instances in which from the construction of the range the water back is higher than the cold-water pipe from boiler, and yet no bad results follow so long as traps in the pipes are avoided. As water finds its own level, there should be no fear of proper circulation under the circumstances. In the sketches as submitted the greatest defect, in my opinion, is that there is a sharp bend on the hot-water pipe B, the pumping of which is not apparent and which should not exist, otherwise there is no reason to consider that the arrangement of the cold-water pipe as shown is in contravention of natural laws and likely to lead to unsatisfactory results.

TRAPS AND VENTS.

As previously announced in the columns of *The Metal Worker*, the Executive Committee of the National Association of Master Plumbers met in New York this week for the transaction of business of the character usually considered in executive session. The Continental Hotel, corner of Broadway and Twentieth street, was the headquarters of the committee, but the meetings were held in the parlors of the Builders' Club at 113 East Twenty-fifth street. President Sheehan of St. Louis presided, and in the absence of Secretary Gerhard the duties of secretary were discharged by F. E. Hopper of Cincinnati. On Monday evening a reception was tendered the visiting committeemen by a committee of the New York Master Plumbers, of which John Byrnes was chairman, at Jaeger's Hall, East Fifty-ninth street, which was a very enjoyable affair. President Sheehan reports the outlook for the National Association all over the country as encouraging and the relations between the manufacturers and the association satisfactory.

The transfer of the Bureau of Inspection of Plumbing and Ventilation in New York City from the Health to the Building Department last June, notwithstanding the fears entertained that the standard of inspection might be lowered through the more or less political complexion of the Building Department, has proved entirely satisfactory to all interested in building matters. The continuance in office of the experienced inspectors who were transferred at the time of the change and the appointment of Col. Geo. D. Scott to the position of chief inspector have been fruitful of the desired results, and though political patronage plays some part in the selection of new candidates, personal fitness is held to be the primary consideration. The Master Plumbers' Association are looking forward to the appointment of the Examining Board by the Mayor, and the indications are that the high standard of plumbing which has been maintained in New York for some years past will be fully secured in the future.

The Dececo Company, Newport, R. I., are to furnish the plumbing fixtures for the $25,000 job of plumbing to be done at the Capitol Building, Washington, D. C.

The contract for plumbing the mess hall, guard house and four company barracks, which are to be built at Plattsburg, N. Y., by the Government, has been let to Babcock & O'Donnell, of Syracuse, N. Y., for $10,694.

The A. Y. McDonald Company, 168 Lake street, Chicago, are to issue a new catalogue of about 400 pages descriptive of the plumbers' supplies, sanitary specialties, pumps, pipe fittings, steam and gas goods handled by the firm.

Under date of January 11 the Colwell Lead Company, 63 Center street, New York, issue a notice to the trade that they have opened a branch in connection with Wm. McShane Company at 1524 Broadway, New York, for the sale of lead pipe, sheet lead, tin lined and tin pipe, pig and bar metal and solder, of which they will keep a full stock on hand. Their store at the corner of Sixth avenue and Thirty-ninth street has been closed.

The Hardware Club.

The following is a list of recent accessions to the membership of the Hardware Club of New York:

R. W. Clemson,
Tarpon Springs, Fla.
Hamilton Disston,
Henry Disston & Sons, Philadelphia.
William E. Gard,
Meriden Bronze Company, New York.
George Kissam,
198 and 199 Times Building,
New York.
S. Y. L'Hommedieu,
Columbia Rubber Works Company,
New York.
D. R. Morse,
Howard & Morse, New York.
E. B. Pike,
Pike Mfg. Company,
Pike Station, N. H.

The project to secure a deep water harbor at Corpus Christi Bay is to be carried into execution without further delay. Engineer E. H. Roper estimates the total cost, including docks and warehouses, at $2,000,000. The trans-Mississippi regions expects to derive therefrom substantial benefit.

Loss of Heat from Range Boilers.

Few persons realize how large a percentage of the heat derived from the fuel burned in the kitchen range is lost by the water circulating through the water back, pipes and boiler. Also, there are but few who do not realize the great annoyance and inconvenience of an insufficient supply of hot water for domestic and toilet purposes—particularly where the facilities provided for furnishing it are of a capacity which is supposed to be adequate. To say nothing of the value of the fuel wasted, it certainly shows a great lack of efficiency in the hot-water apparatus, if of the ordinary size in proportion to that of the establishment—that the quantity of water heated should be less than is necessary to meet the ordinary requirements of the family.

In American families the bath (and the use of it) is one of our indispensable institutions, and with the exception of a very short period during the summer season, the quantity of water necessary from the boiler to give a comfortable temperature is considerable. In case several members of the family desire to use the bath consecutively the supply usually falls short, and the unfortunate whose turn comes at the tail end of the list must either resort to the expedient of heating water by other means, or else hurry up the fire (at a considerable expenditure of fuel) to cause the boiler to heat up more rapidly. In either case the situation calls for the exercise of much patience, or, in default thereof, a safety valve which emits the odor of brimstone in volumes proportionate to the temperament of the individual interested. Now, the question is, does the insufficiency of hot-water supply result from want of a possible capacity in the heating apparatus, or does it come from conditions external to the latter, and if so, can the trouble be more or less easily remedied?

CAPACITY OF BOILERS.

In order to intelligently answer the question as to sufficiency of the capacity, it becomes necessary first to ascertain what that capacity should be under existing conditions affecting the absorption of heat by the water; and, second, to calculate the quantity of water at a given temperature necessary to supply the maximum requirements, as represented by the consumption for bathing purposes. Of course these quantities can only be calculated approximately, as the conditions governing them are necessarily assumed, but the results may be considered as being very close to the average as actually realized in practice. The several factors entering into the calculation of quantity of heat absorbed by the water are: 1, temperature of the fire in contact with the external surface of water back (or its equivalent); 2, the conductivity of the material of which the latter is composed, of course taking into account the deposits from oxidation and impurities in the water, on the internal surface; 3, the specific heat of the water, or the number of heat units necessary to raise a given quantity (by weight) to a given temperature, and 4, we must assume a hypothetical condition, that there is no loss of heat by the circulatory and storage portions of the apparatus.

As to the first, we may say that about 1500° F. will represent the temperature of an ordinary range fire when the latter is not being forced for the purpose of heating the ovens, for instance; but as there is always an accumulation of more or less ash from the coal in contact with the heating surface of water back, and as the ash is a non-conductor of heat, we may call the actual effective temperature, say, 1200°, which is the first quantity in our calculation. Second, the conductivity of materials of different kinds has been accurately ascertained by numerous careful experiments, the results of which are accepted as standard in all calculations of this nature. From this source we find the conductivity of cast iron, of which the water backs are made, to be 233 heat units transmitted per hour from the fire to water in circulation for each square foot of heating surface and a thickness of metal of 1 inch. These quantities are for a difference of 1° between the temperature of the fire and that of the water. Assuming the heating surface to be $6 \times 12 = 72$ square inches, or $\frac{1}{2}$ square foot, the thickness of metal at $\frac{1}{4}$ inch, and the mean temperature of the water 100°, we have then 233 heat units $\times$ $\frac{1}{2}$ square foot $\div$ $\frac{1}{4}$ inch $\times$ (1200° − 100°) = 1100° = 512,600 heat units per hour absorbed by the water. As, however, this represents the quantity for iron—*i. e.*, clean iron—and as there is always more or less oxide or scale on the water surface, we must calculate the allowance necessary for the lower degree of conductivity of such deposit, which must be substituted for the foregoing total.

DEPOSITS IN WATER BACKS.

The conductivity given for fine-grained calcareous stones, which are very similar to the ordinary lime deposit from water, is 22.4 heat units per hour. Assuming a thickness of deposit of $\frac{1}{16}$ inch, we find 22 4 heat units $\times$ $\frac{1}{2}$ square foot $\div$ $\frac{1}{16}$ inch thick $\times$ 1100° = 123,200 heat units transmitted per hour, from the cast iron to the water through the $\frac{1}{16}$ inch of scale. Thus we see that a loss of conductivity, and consequently of capacity, of (512,600 − 123,200) = 367,400 heat units, or $\frac{389\,400}{512,600}$ = 76 per cent., results from the presence of this coating. As will be seen from the following, however, this loss of capacity does not amount to a reduction of the efficiency below the point necessary to provide an ample supply of hot water were all of the heat utilized or, rather, retained by it. The quantity would be found as follows: Assuming, as an extreme condition, that the initial temperature of water entering the boiler from service pipe is found to be 36°. Then 100° − 36° = 64°. As a unit of heat is the quantity necessary to increase the temperature of 1 pound of water 1°, or from 39° to 40° F., we may calculate the quantity which the water back would heat under above conditions. One gallon of water at temperature of maximum density weighs 8 34 pounds; then 64° $\times$ 8 34 = 533.76 heat units necessary to raise 1 gallon of water from 36° to 100°, and $\frac{123,200}{533.76}$ = 230 gallons nearly, which could be heated every hour as above. This is manifestly far in excess of the possible legitimate maximum consumption.

The latter may be roughly calculated as follows: Say the quantity asked for, a very liberal depth of water for each bath, is 30 gallons, and the desired temperature is 75°. With the cold water at 36°, the quantity drawn from the boiler at 100° will be (75° − 36°) = 39° $\times$ 8 34 pounds per gallon $\times$ 30 gallons = 9757.8 heat units to raise the 30 gallons from 36° to 75°. Then as we have found 1 gallon of water at 100° to contain 533.76 heat units more than that at 36°, 9757 8 $\div$ 533.76 = 18 3 gallons at 100° required to mix with (30 − 18 3) = 11.7 gallons at 36° to give 30 gallons at 75°. Now, as it may be fair to consider four persons bathing in one hour as the maximum number, the total quantity of bath water from the boiler will be 18 3 $\times$ 4 = 73.2 gallons. Allowing 26.8 gallons to be the consumption for all other purposes during the hour, we have a total of 100 gallons as the maximum possible requirements, or, in reality, at least double the actual consumption. As we have found the capacity of the water back to be, apparently, 230 gallons per hour it would, therefore, seem ample, being 2 3 times as great as the maximum consumption. But, as a matter of fact, the above quantity of 100 gallons per hour is fully double what can usually be obtained from a boiler having the given heating capacity; and certainly one which can supply as much as 50 gallons per hour at 100° may be considered as being above the average efficiency.

WHERE DOES THE HEAT GO?

What, then, becomes of all the heat taken up by the water? It must go somewhere, as it is not in the water when drawn, and the actual efficiency, as compared with the calculated capacity of the water back, is less than 22 per cent. We have, therefore, a discrepancy of 78 per cent. to account for, and a portion of it, at least, is not very difficult to locate. We have in the boiler and its connecting pipes a relatively large amount of unprotected metallic surface, which, owing to its high degree of conductivity and radiating power, must necessarily cause the loss of a very large percentage of the heat absorbed by the water from the fire. Under the same assumed conditions as above we may calculate this loss and then see whether or not some efficient remedy is not absolutely demanded as a matter of correct practice in so important a branch of domestic engineering. Of course, during the cold weather, when the use of artificial heat is necessary to maintain a proper temperature of the atmosphere, the loss from the boiler—though at that time the most serious as regards the hot-water supply—is not a loss of economy so far as the fuel consumption is concerned, but in the summer months, when the use of a range fire becomes a disagreeable necessity on account of the heat, the additional diffusion by the boiler becomes not only a dead loss of fuel, but an unmitigated nuisance as well.

Taking, for example, a boiler of 12 inches diameter by 66 inches hight, and 8 feet of lead pipe for water-back connections, together with 20 feet for sink and bathroom service. The external area of boiler will be ($12^2 \times 0.7854$) $\times$ 2 = say 226 square inches, or 1.57 square feet, in heads and (12 $\times$ 3 1416) $\times$ 66 = 2488.2 square inches = 17 28 square feet in shell; 17.28 + 1 57 = 18.85 square feet, total.

The thickness of metal we may assume to be uniform in heads and shell at $\frac{1}{16}$ inch, and the surface (galvanized) to be not bright. In this calculation we must consider the loss of heat from three distinct sources, viz.: conductivity, radiation and contact of air. Let the temperature of atmosphere in the kitchen be 65°, which is probably rather above the average, when water is 36°. The loss (by contact of air) from the boiler—as determined by experiment—will be 0.52 heat unit per square foot per hour for each degree of difference between the inside and outside temperatures. Then 0.52 $\times$ 18.85 $\times$ (100° − 65° = 35°) = 344 heat units. By radiation the loss will be 0.5662 $\times$ 18 85 $\times$ 35° = 373.23 units. These two items, though comparatively small, have their share in the aggregate.

LOSS FROM CONDUCTION.

The loss from conduction is the most serious, as will be seen from the following: There is a very considerable portion of the surface of the water back in contact with the front and sides of the range, where the latter do not receive any of the heat from the fire and are exposed at their external surfaces to the atmosphere. In fact, most of the heat received by them is that — by conduction — from the wate back (or rather, as in most modern ranges

water from 8), and as their temperature may be safely taken as at least 30° below that of the water in circulation, and the surface as, say, ¼ square foot, we find the loss for ¼ inch thickness to be 233 × ¼ + ¼ × 30° = 3495 heat units, or about five times as much as that for radiation and contact of air combined. This gives a total for the three sources of loss of 4212 heat units per hour.

In the pipes as previously specified we have about 9 square feet. The loss is by radiation and contact of air only; and with the same difference of temperatures between water and air, we have for the former 0 5663 × 9 × 35° = 178.4 heat units. By contact of air 0.52 × 9 × 35° = 163.8. These latter quantities are mostly limited in their effect to the time during which the water is flowing through the pipes. Added to the previous sum they give the aggregate of 4554 units as the total calculated loss of heat absorbed by the water from the fire.

As $\frac{4554}{123,200} = 0.037$, or 3.7 per cent., we must look further for causes of the loss of efficiency. Of course, when the water temperature is greater than that assumed in the foregoing calculations, the loss will be proportionately greater. At 150°, for instance, it would be $4554 \times \frac{150}{100} = 6831$ heat units, or 5 54 per cent. But it is clearly evident that even this larger percentage will not explain the want of efficiency as compared with the capacity found by calculation from our assumed conditions; and it is here we must look for the discrepancy. Of course, the fact is well known that the loss from the unprotected surface of the boiler represents a comparatively large percentage of the total heat absorbed by the water, and as we have found it by the above figures to be so small, the inference is that the quantity absorbed must be considerably less, and that the assumed conditions do not, in reality, exist.

(To be continued.)

The Foundrymen's Association.

The twentieth meeting of the Foundrymen's Association was held at the Manufacturers' Club, 1409 Walnut street, Philadelphia, January 4, at 8 o'clock p.m. In the absence of the president and vice-president, P. D. Wanner of the Mellert Foundry & Machine Company, Limited, Reading, Pa., was chosen chairman of the meeting.

The minutes of the last meeting were read and adopted.

The following persons were present:

Albert E. Hay of Robinson Machine Company, Altoona.

Clemens Jones, Easton.

Isaac P. Chalfant of Chalfant Mfg. Company, Lancaster.

Wm. Green, Jr., of Vulcan Works, Chester

Henry Ruhland of Henry Ruhland & Co., W. C. Henderson of Thos. Devlin & Co., A. W. Howe and Stanley G. Flagg, Jr., of Stanley G. Flagg & Co., L. B. Whitney and Asa Whitney of A. Whitney & Sons, Ed. Bureau of Bureau Bros., E. E. Brown of E. E. Brown & Co., Geo. B. Wood of R. D. Wood & Co., Harry Redmann of G. Redmann & Co., P. Kearns of Stuart Petersen Company, Geo. C. Davies of Chamberlain, Turney & Baird, J. H. Julien of J. W. Hoffman & Co., Howard Evans of J. W. Paxson & Co., all of Philadelphia.

L. S. Wright of Camden Iron Works, Camden, N. J.

James T. Sterling of Harlan & Hollingsworth Company, Wilmington, Del.

Leslie Griscom of Pennsylvania Diamond Drill & Mfg. Company, Birdsboro.

H. J. Herb of Adam Johnston & Son, Reading.

Geo. A. Messick of Pusey & Jones Company, Wilmington, Del.

J. Ogden Hoffman of Frick Coke Company, Pittsburgh.

Andrew McCardell of Pond Machine Tool Company, Plainfield, N. J.

G. T. Marsh, superintendent South Baltimore Foundry.

E. M. Mumford of H. R. Worthington, Elizabethport, N. J.

P. D. Wanner of Mellert Foundry & Machine Company, Reading.

Fred H. Eaton, vice-president Jackson & Woodin Mfg. Company, Berwick, Pa.

The Executive Committee made a report of their meeting, stating that they had decided to send a list of the castings which were presented at the December meeting to the members of the association and others, requesting that they send to the secretary prices for the different castings, f.o.b. at the respective shops, patterns, flasks and core boxes being furnished. It was also decided that samples of coke, with analysis of the same, be presented at the January meeting, so that a discussion may take place on that subject. The secretary stated that he had made arrangements with Mr. Clemens Jones, M.E., late chemist of the Thomas Iron Company, to address the association at the January meeting on the subject of "The Relations of Chemistry to Foundry."

The Railroad and Freight Committee stated that they had attended the meeting at the Manufacturers' Club on December 14, looking toward the formation of a Philadelphia Transportation Bureau, to be composed of 12 different Philadelphia organizations who are at present interested in this matter, the object being to form a grand organization with a wider scope than is existing at the present time, with headquarters at the Manufacturers' Club. A prolonged discussion took place upon this matter, and it was finally decided that this conference deem it expedient to postpone for the present the formation of a general freight bureau. The committee reported progress.

The following new members were then elected: *The Iron Age* of New York, with Thomas Hobson as agent of 220 South Fourth street, Philadelphia; Rogers, Brown & Co., J. M. Warner, manager, pig iron, Bullitt Building, Philadelphia; Yale & Towne Mfg. Company, manufacturers of cranes and foundry; H. R. Towne, president, Stamford, Conn.

The bids on castings, which were presented at the last meeting, were opened and read, and it was found that there was a very slight difference in the prices offered, the figures from the West being lower than those of the Eastern shops. Each bidder was designated by the town in which he was situated, so that names were not used, the feeling being that it was proper to do so, because otherwise information given in confidence might be given away. A discussion took place as to whether it would be best to present other castings and get prices, or whether it would be acceptable to have the association solicit direct from customers orders for castings, having them read before the association and ask for actual bids. It was then left in the hands of the Executive Committee for further action.

Samples of coke were presented with analyses, and a discussion took place on that subject, but the time being limited, was postponed until the next meeting in February.

The chairman of this meeting then proposed a subject which he thought would be of interest to all foundrymen, which was to appoint a committee to report at each meeting current prices at which castings are sold in different parts of the country, the object being to find out as nearly as possible about the price at which castings are being sold. This seemed to be acceptable, and at the next meeting it is expected that all members or others may report any contracts for castings that they might have heard of, together with the price at which they were taken, when a further discussion will be held.

Clemens Jones, M.E., late chemist of the Thomas Iron Company, then made an address upon the subject of "The Relation of Chemistry to Foundry." A vote of thanks was extended to Mr. Jones for the very able manner in which he handled this subject, and the address was ordered to be printed and distributed. The matter contained in this address would seem to show conclusively that chemistry can be better depended upon in foundry practice than the usual plans adopted, and that it was possible, by chemical analysis, to determine the quality of castings and strength, &c., almost to a certainty by a proper mixture, whose chemical analysis is known before it enters the cupola, and that as a rule the analysis, as given by the different parties making iron, could be depended upon implicitly. If the foundrymen would send their orders to the furnacemen for iron with specifications that it should contain certain percentages of carbon, silica, &c., that the furnacemen could furnish it without difficulty.

The minutes are signed by Howard Evans, Secretary.

Contracts Open.

Sydnor & Shepard, water supply contractors, 1445 East Main street, Richmond, Va., inform us that they are in the market for bids on two water towers or stand pipes, to be erected in the State of Virginia. One to be 20 feet in diameter and 80 feet high; the other 25 x 100 feet. They wish specifications and prices for the towers, erected, with plain iron ladder and cornice finish on top. The firm furnish their own foundations.

Treasury Department, office Supervising Architect, Washington, D. C., January 3, 1893.—Sealed proposals will be received at this office until 2 o'clock p.m. on February 1, 1893, and opened immediately thereafter, for all the labor and materials required for the stone and brick work of superstructure, roof covering, &c., of the United States Court House and Post Office Building at Tallahassee, Fla., in accordance with the drawings and specification, copies of which may be had on application at this office or the office of the Superintendent at Tallahassee, Fla. Each bid must be accompanied by a certified check for a sum not less than 2 per cent. of the amount of the proposal. The right is reserved to reject any or all bids and to waive any defect or informality in any bid, if it be deemed in the interest of the Government to do so. All bids received after the time stated will be returned to the bidders. Proposals must be inclosed in envelopes, sealed and marked "Proposal for Stone and Brick Work of Superstructure, Roof Covering, &c., of the United States Court House and Post Office Building at Tallahassee, Fla.," and addressed to W. J. Edbrooke, Supervising Architect.

Treasury Department, office Supervising Architect, Washington, D. C., January 3, 1893.—Sealed proposals will be received at this office until 2 o'clock p.m. on January 31, 1893, and opened immediately thereafter, for all the labor and materials required for the cut stone work and brick work, iron and wood floor, ceiling and roof construction and roof covering for the superstructure of the United States Post Office Building at Danville, Ill., in accordance with drawings and specification, copies of which may be had on application at this office or the office of the superintendent at Danville, Ill. Each bid must be accompanied by a certified check for a sum not less than 2 per cent. of the amount of the proposal. The right is reserved to reject any or all bids and to waive any defect or informality in any bid if it be deemed in the interest of the Government to do so. All proposals received after the time stated will be returned to the bidders. Proposals must be inclosed in envelopes sealed and marked, "Proposal for the Cut Stone Work and Brick Work, Iron and Wood Floor, Ceiling and Roof Construction and Roof Covering for the Superstructure of the United States Post Office building at Danville, Ill." and addressed to W. J. Edbrooke, Supervising Architect.

Steam and Hot-Water Circulation

English Practice in Hot Water Heating—XVIII.*

INDEPENDENT BOILERS.—BRICK-SET BOILERS.

Among types of independent boilers we may mention first Keith's Challenge boiler, Fig. 70, which is well known, and for those purposes to which it is adaped it is decidedly successful. The peculiarity is in its internal construction, which, as before referred to, presents a very large area of direct heating surface in a comparatively small space. It is a cast boiler, and built up in sections as the illustration shows, and it can be seen that the power of the boiler can be increased, or the reverse, within certain limits by the addition or removal of some of the sections. The lower sections which constitute the furnace are convoluted inside, which about doubles the area of surface compared to flat plates. The upper sections are more complex, being partly convoluted, and also having cross waterway bars extending from side to side. Other devices of a similar nature are resorted to to increase the interior heat receiving area. The fact of the parts being cast iron permits of these varieties of surfaces being easily obtained in the manufacture, a result that would be difficult and costly to obtain (to this extent) with wrought plates.

If desired, the sections can be arranged for the feeding door to be placed at a higher position, so that the boiler may be charged with coke to last several hours. This, however, is not desirable if the full power of the boiler is needed. In fact, every boiler is at a disadvantage in being filled up in this manner with fuel, as the black mass in the upper part of the boiler effectively prevents the plates at that part receiving the heat that should be imparted to them, and the boiler is worked almost wholly by the glowing fuel in contact with the plates at bottom.

A boiler of this character must necessarily be coated with non conducting compound, or surrounded with brick work, to prevent loss of heat, and with a boiler having such a large direct heating surface, with comparatively little water, there should always be two or more flow pipes and returns. This boiler is made to heat up to 7000 feet of 4 inch pipe.

The last boiler of the independent order to be mentioned is by the same maker, and termed the Python, as it is of a horizontal shape, and can be shortened or lengthened by the withdrawal or addition of sections. Fig. 71 shows the boiler in front elevation, but with the front casting and its fire doors, &c., removed. This boiler has a convoluted inner surface, top and side, and a multiplicity of other heating surfaces, chiefly in the form of cross waterway bars. This, and also the last boiler mentioned, has fire bars that, by the movement of a lever handle outside, set up a rocking motion to clear the bottom of the fire and assist in preventing clinker forming. This arrangement prevents the too frequent opening of the stoking doors. This is the most powerful boiler made, and is used for such works as public washing and swimming baths and laundries.

The automatic damper, or draft regulater, shown in the flue nozzle at back, is worth describing, as it acts upon a good and reliable principle. This damper is practically an Arnott's ventilator in its action, opening into the flue or chimney and permitting air to pass in, in variable quantity, according to the extent that its flap is open. The flap or door is nicely pivoted at its lower edge, and by the use of a little balance weight it swings to and fro with very little impulse. Now, it is probably known to most of the readers that the draft in a chimney is very irregular, even within the space of a few minutes, at one moment being strong and another moment rather slack. This quick irregular action is generally due to wind, but a slower but just as inconvenient irregularity is brought about by careless or insufficient attention to the fire. If an ordinary damper is left open a little too far and the attendant absents himself, a deal of annoysance may be experienced by the fierce burning of the fire, &c., and this automatic damper obviates this.

If we make an opening in a chimney a short distance above a stove or boiler, we shall find that an inrush of air immediately sets in through this aperture, and the current of air through the fire below will be reduced proportionately. Now, the automatic damper is this opening, but its balanced door or valve regulates the amount of air that passes in. If the fire commences to burn fiercely the draft in the chimney at once becomes strong, but its strength in this case defeats itself, as it causes the valve to open, and the inrush of air robs the fire below of draft, which at once checks its fierceness. With the abatement of the fierceness the draft in the chimney also slackens, and this allows the valve to wholly or partially close until called upon to act again. Any irregularity of draft caused by wind, and which,

ENGLISH PRACTICE IN HOT-WATER HEATING.

* Reprinted from the *London Builder*.

would make the fire burn badly, is checked by the same means. Whether the fire or whether the wind is the cause of excessive draft in the chimney, this valve checks it just the same. (The draft in a close-fire kitchen range can be regulated in precisely the same manner by inserting an Arnott's valve in the chimney breast.)

BRICK SET BOILERS.

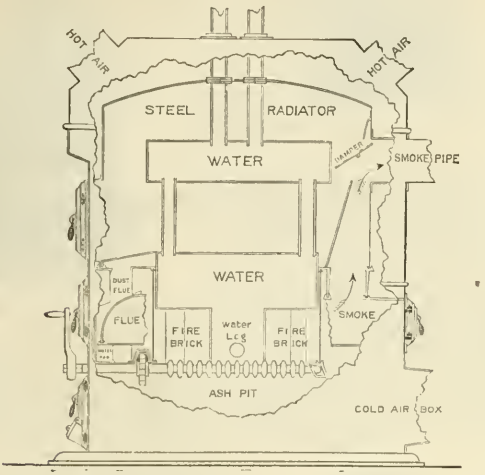
The shape that necessarily takes precedence in this description is the "saddle" boiler. It is one of the oldest forms we have, cheap to make, effective (up to a certain size), and its shape is calculated to benefit by the heat evolved from the fire. The addition of waterway ends front and back makes it as nearly perfect as a wrought boiler can be. When, however, we require a great quantity of pipe to be heated it is more economical in results to have some one of the more complex forms of boiler, which present a greater heating surface within a restricted area.

It will be noticed that with the saddle boiler, Fig. 72, at a point about half way up, the plates begin to describe a half circle over the top, both outside and inside. This, in the writer's opinion, is a disadvantage, not so much inside, however, as outside.

With the outside flue, or indirect heating surface, it has been explained that plates which come beneath the source of heat are practically valueless, owing to flame and heated gases having no efficient contact with surfaces beneath them (unless the flue be choked somewhat, when an objection of another kind presents itself). In addition to this, these surfaces always have a collection of dirt upon them, which by itself would prevent a ready transfer of heat to the water. A square shape, as Fig. 73, would give better results, as the inside and more effective direct heating surface would be increased and the vertical surface outside would be added to: vertical surface, notwithstanding its low value, being more useful than a surface beneath the source of heat. By having the boiler of this shape, the flame can be led up and down its length as usual, but along the side, the midfeather being central, as shown. The top, the useless surface, need not be made use of except to support the brick work above, and this would reduce the cost of fixing. Most of the newer shapes, which follow the saddle somewhat, are of square cross section, and the top outer surface is not used except in the way just mentioned.

In fixing saddle boilers (ordinary shape) there are two methods in common use, one being adapted for the smaller sizes and the other and more usual method for small and large sizes alike. The former method is to fix the boiler so that heat and heated products escape from beneath the boiler at all points, and so envelop the boiler without being specially conducted by flues to this end. It is a very effective method. Fig. 74 shows in longitudinal section the boiler so fixed; it is set upon four fire bricks, one at each corner, these raising it 3 inches above the fire bars. By this means the draft in the chimney causes the heated gases to pass from the fire box under the sides, and then embrace the outer surface of the boiler, as a moderately close fitting arch is thrown over. The space between the boiler and the brick work of the arch would be, say, 3 inches.

The illustration shows the chimney leading off from the center at top. This can commonly be arranged and gives the best results; if, however, the chimney must be carried up at the back, then feathers must be introduced to keep the heat from inclining toward that point too much. It will be noticed that only a narrow space is left between the boiler and brick work at front and back. The object of this is to prevent the too free escape of heated gases at these high points, as otherwise we should not get heat to pass under the lower sides. This space in question should be 1 inch to 1½ inches. If the chimney was carried up at the extreme back, the boiler would be butted tight against the brick work at that end. A damper to regulate the draft would have to be fitted in the brick chimney immediately where it starts at from the top. This is the usual and the best and most convenient position for it. This method, as mentioned, is only suited for small boilers, as will be readily understood. It possesses a disadvantage in the fact that when the fire has been going slowly for a little time without attention, the passageways beneath the lower side edges of the boiler become choked with ash, &c., and the outer indirect heating surface has little of the heat. The less useful spaces at each end of the boiler would be more active then, but it would not do to stop or omit them. Boilers fixed in this manner will more quickly fail with accumulated dirt than when they are fixed with their lower edges level with the fire bars.



The Atlantic Combination Heater.—Fig. 1.—Sectional View of Heater.

The Atlantic Combination Heater.

The accompanying illustrations show the Atlantic combination heater, made by the Portland Stove Foundry Company, Portland, Maine. Fig. 1 is an outline sectional view of the entire apparatus, while Fig. 2 shows the water section complete. The heater consists of a cast-iron ring surrounding the upper part of fire pot, below which a row of fire bricks extends to the grate to permit a low fire to be maintained in mild weather. The upright pipes connect the ring with hollow cast coils directly above it, from which rise pipes to carry the heated water. The self-cleaning grate, large ash pit, dust damper, regulating damper and other features of the Atlantic hot air furnace are retained in the combination heater.

HEATING NOTES.

THE EXCELSIOR STEEL FURNACE COMPANY, 110 to 114 South Jefferson street, Chicago, have issued a revised circular giving their lines of goods for 1893, from which we observe that they have added the Brown patent radiators, claimed to save one-third the space over the usual pattern, the Detroit quick-opening valves, the Detroit union ells and the H. & M. make of altitude gauges and thermometers. They furnish a full line of supplies for furnace dealers and contractors of hot water and steam heating.

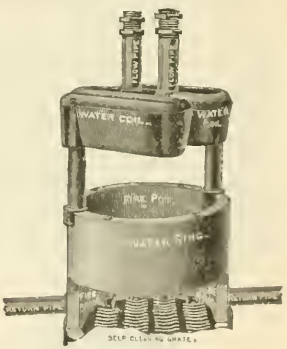


Fig. 2.—Water Section Complete.

GEO. D. HOFFMAN, 82 Lake street, Chicago, Western sales agent for the Economy heaters and Western engine, is to make extensive alterations and improvements to his salesroom. The walls and ceiling are to be decorated, and a new floor laid. The workshop, which at present occupies the rear, is to be moved, thus giving the entire floor for the display of goods. An electric light plant, run by a Western engine, will be placed in the basement for the purpose of lighting the salesroom. The establishment will thus be in good shape for the reception and entertainment of customers who may visit Chicago during the progress of the World's Fair.

THE HOLLAND RADIATOR MFG. COMPANY, 89 Lake street, Chicago, have issued a catalogue illustrating and describing the new Holland radiator. The principle on which this radiator is constructed has already been illustrated in our

columns. The manufacturers lay stress on two points in connection with these radiators. One is that the loops can be disconnected without the use of complicated tools and another that large and unobstructed openings are provided for the passage of steam and water. Minor points are brought forward also to sustain the claim that the Holland will be found efficient and satisfactory in every particular. An illustration is given of a steam or hot-water mantel, consisting of a fire place heater which is used as the basis of the system, utilizing direct radiation in the room in which it is placed and heating other rooms on the same or a higher level by water or steam.

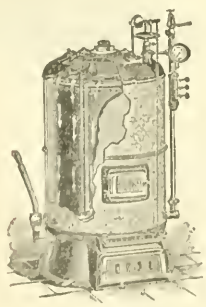
THE JOHN DAVIS COMPANY, heating contractors and jobbers of steam-fitters' supplies, 69-79 Michigan street, Chicago, have secured the contract for supplying the piping for the two electric fountains at the World's Fair.

THE OFFICE AND SALESROOM of the Holland Radiator Mfg. Company, Chicago, has been removed from 48–50 Franklin street to 89 Lake street.

UNDER DATE of January 3 the Missouri Steam Heating Company, 931 North Second street, St. Louis, Mo., inform the trade that James H. Davis and O. L. Fuller are no longer connected with their firm. H. W. Stone, formerly with the St. Louis Steam Heating & Ventilating Company, has assumed the management of the contracting and constructing departments and will act as secretary of the Missouri Steam Heating Company.

Sun Steam and Hot-Water Heaters.

In the accompanying illustrations we show general and sectional views of the Sun steam heater and the Sun hot-water circulator (Lindemuth's patents) manufactured by the Raymond & Campbell Mfg. Company of Middletown, Pa. These boilers, it is said, are constructed wholly of steel of 60,000 pounds tensile strength, or of iron of 45,000 pounds tensile strength. The manufacturers point to the fact that the water spaces are so divided by heating surfaces in fire and drop tubes that positive circulation is obtained in all parts of



The Sun Steam and Hot-Water Heaters — Fig 1.—Broken View of Sun Steam Heater

the boiler. A further feature is the efficient combustion obtained by giving an ample combustion chamber over the fire box where there is plenty of space for the gases to mix and thoroughly consume. The heat, as shown in the sectional views, ascends into the combustion chamber, passes around the drop tubes, then up the fire tubes and along the shell of the boiler, from where it is drawn off into the smoke flue. After the heat passes out of the fire tubes it is carried into a heat collecting chamber divided by deflecting shields which meet angle iron plates to cause the hot gases to pass evenly over the shell of the boiler. These deflecting plates or arms are movable by means of a lever extending to the outside of the casing of the heater. By this means, the manufacturers point out, economy of fuel is obtained and ease of regulation

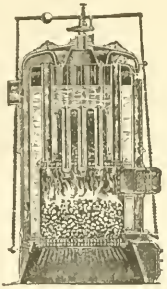


Fig. 2.—Sectional View of Sun Steam Heater.

assured, especially when combined with the use of the draft door in front of base and check door on rear of base of heater, when connected with the automatic regulator. They call particular attention to their check and dust damper at rear of base as assuring economy of fuel. The Sun boilers are said to be very easily cleaned, the steam heaters by the use of flue blowers and the hot water heaters by flue brushes of special design.

Fig. 1 shows the Sun steam heater with shell broken away. It is of the portable form with all the steam fittings attached. The arrows in the cut show the direction of the heat after leaving the heat-collecting chamber. The arms of the draft controller are shown in the cut as meeting with the angle iron riveted to the shell of boiler, which position closes the direct passage to the flue and makes the heater down draft. The hand hole plates on top of heater and on the flange on the bottom of the base are easily removed for cleaning purposes. The casings of the heaters are heavy galvanized iron jackets, lined with asbestos. A sectional view of the Sun steam heater, shown in Fig. 2, reveals the drop tubes, combustion chamber, fire tubes, water and steam space, &c. The steam heaters are made in six sizes, with diameter of fire pot from 17 to 36 inches, adapted to supply from 205 to 1125 square feet of direct radiating surface.

Fig. 3 shows the Sun hot-water circulator, which is of the same general construction as the steam heater, the principal difference being in the distance from the top of the gas chamber head in which the drop tubes are screwed to the outlet of heater, this space in the circulator being about one-third the distance of that in the steam heater. It is mentioned that the fire on the drop tubes and gas chamber head makes the water hottest where it leaves the circulator. It is also mentioned that the vertical position of the heating surfaces is favorable to the free and unimpeded circulation of the water. A sectional view of the Sun circulator is shown in Fig. 4. The water returning enters the water space around the fire pot and is deflected in a spiral direction by a piece of iron riveted to the fire box sheet. The hot water heater is likewise made in six sizes and is adapted to supply from 300 to 1700 square feet of direct radiating surface. The Raymond & Campbell Mfg.

Fig. 3.—Broken View of Sun Hot-Water Circulator.

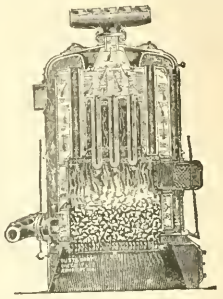

Fig. 4.—Sectional View of Sun Hot-Water Circulator.

Company also made the Sun hot-water heater as a heavy duty or closed tank system heater, and where desired they furnish the Sun as a brick set heater instead of in the portable form.

The final estimates of the yield of cereals for the year 1892, just completed by the Department of Agriculture, gives the following results:

	1892.	1891.
Wheat.....	515,949,000	611,780,000
Corn.....	1,628,464,000	2,060,144,000
Oats.....	661,035,000	738,394,000
Totals.....	2,805,448,000	3,410,328,000

The wheat crop is thus declared to be almost 16 per cent. less than in the preceding year, the corn crop is over 20 per cent. less, and the oats crop is over 10 per cent. less. It will be remembered, however, that the year 1891 was the most remarkable for cereal production this country has ever known. Iowa and Kansas are the two leading States, the former producing over 200,000,000 bushels of corn, while Kansas boasts of nearly 71,000,000 bushels of wheat. As corn States Nebraska, Missouri and Illinois are not far behind.

A large amount of structural iron will be used in what is known as the Park avenue improvement above 106th street, where the tracks of the New York Central railroad will be sustained by an elevated structure. Including the drawbridge over the Harlem River the cost will be about $4 000,000 The contract for the cast iron bases, made with the Allentown Foundry & Machine Company, alone amounts to $16,656.

Extreme depression prevails in the shipping industry of England and the Continent The total number of vessels laid up at English and Scotch ports is 479, and the total tonnage is 856 000 Besides these, there are laid up in Continental ports 99 steamers, with a total tonnage of 100,000.

TIN PLATES.

N. & G. Taylor Company's Tin-Plate Works.

A tinning plant which has an estimated capacity of more than 1,000,000 boxes of tin plates annually has been recently erected and put into operation by N. & G. Taylor Company of Philadelphia, a firm who have been in existence since 1810 as importers, and latterly as manufacturers of tin and terne plates.

Their original manufacturing plant—a small one of but three stacks—was, it will be remembered, destroyed by fire in the early part of last year; but, rising Phœnix-like from its ashes, the works have entered with renewed vigor upon a fresh lease of life, and on a far more extensive scale than before.

A plan of the works is shown in Fig. 1. The ground upon which the new works stand is a rectangular plot of 170 x 385 feet, on Tasker and Meadow streets, in the southeastern quarter of Philadelphia. Its advantages as regards shipping facilities are unequaled, for no less than three lines of railroad run directly past its walls, with all of which it is in communication by side tracks leading into the premises. Beyond this the Delaware River, with its wharves, is but a few hundred feet distant, so that abundant means of transport by land and water are close at hand.

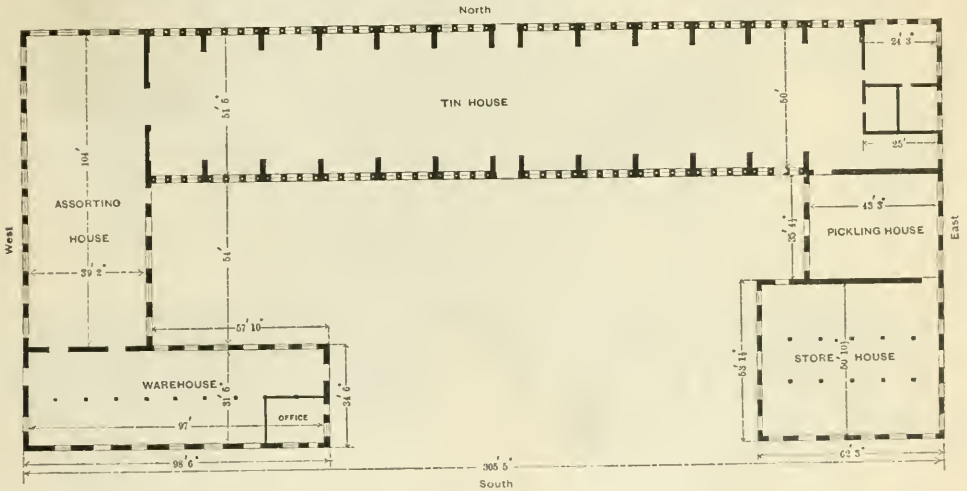
A brief description of this establishment will be of interest to our readers, and will serve to show what manufacturers of American tin plate are doing, in one instance, toward the establishment of this desirable industry on a solid basis and on an adequate scale.

The works, see Fig. 1, so far as they are at present completed—and the most important portions are already finished and in regular operation—are built round three sides of the rectangular plot above mentioned, leaving a vacant space between, which will before long be occupied by a smelting house on a large scale, machine shop, blacksmith's shop, &c., and sufficient room will be left for inserting another tin house with a capacity of a dozen or more additional stacks, when such augmentation is rendered necessary.

On the extreme right of the premises is placed the stock room, where the raw material and all necessary supplies are received and stacked. Here is ample store of black sheets, pig tin and palm oil, the three staples used in the manufacture of tin plates. The black sheets now used by N. & G. Taylor Company are, to a considerable extent, of home production, rolled in the Pittsburgh district; and they are stated to be distinctly preferable to the majority of imported sheets in point of softness, pliability, smoothness of surface and general finish, in addition to which they possess the advantage of not having passed through an ocean voyage with its attendant risk of deterioration from the action of sea air and salt water, and other drawbacks to which foreign sheets are subjected during what is often a lengthy journey with delays, exposure to weather in transference from shore to ship and ship to shore, &c., the effect of which on the material is often that the sheets arrive in a state of rust which necessitates longer pickling before use.

The pig tin used is either Straits or Australian metal, the best yet discovered for tinning purposes, which is delivered in Philadelphia as cheap as the same can be procured in Great Britain.

Connected with the receiving department is a commodious house containing the pickling apparatus, a revolving crane with three cradles, each holding a large number of sheets and working over two immense vats, one of which contains the pickling solution, in which the sheets are allowed to soak for three or four minutes or more according to their degree of cleanliness. From thence the loaded cradle is transferred to the adjacent swilling vat, in which they are thoroughly cleansed, after which they are conveyed to the tinning stacks, the surplus stock being taken to a number of water tanks ranged along one side of the room, there to remain until required in the tinning department. The carriage of all material is rendered easy by a system of small hand cars which operates through the whole extent of the works.



N. & G. Taylor Company's Tin-Plate Works.—Fig. 1.—Plan of Works.

Next to the pickling room, and situated in the northeastern corner of the buildings, are the engine and boiler houses; the former containing a 50 horse power Corliss engine and an electric light engine of 25 horse-power to operate the Thomson-Houston electric light plant which has been fitted throughout the establishment. There are two boilers of 75 horse-power each made by the Sterling Company of Chicago. Between the boiler house and tin shop an artesian well 670 feet deep has been sunk from which an ample supply of pure water is drawn. A 35,000 gallon tank is placed in the yard, which is filled from the well, and from it a system of pipes leads through the tinning house, with taps at each stack, securing a ready and unfailing supply of fresh water to hand.

The most notable feature of the whole establishment is the tinning house, which is of fine proportions. The illustration, Fig. 2, will give a very good idea of the general aspect of the room, which is 305 feet in length and of unusual width. It contains 23 stacks, 12 on the north side and 11 on the south side, with a clear space of 18 feet between each stack. The building is constructed of brick and iron, with

a floor composed of bricks set on edge and filled in with cement, laid over a solid bed of concrete. The tin house is isolated from the rest of the establishment by fire doors at either end so that it is absolutely fire proof. One is immediately struck on entering this department by the unusual lightness, coolness and absence of fumes from the pots. The latter feature is, we learn, secured by an excellent draft arrangement which carries the vapor up the stacks. Skylights of generous size and large grated windows give the workmen ample light and fresh air, and their comfort and convenience appear to have been studied throughout.

At present nineteen stacks are in active operation night and day. The weekly average output is now some 2000 boxes. N. & G. Taylor Company's guaranteed plates, on which a large proportion of the pots are employed, are all turned out on the pure palm oil process. The pots now are in operation on the cheaper grades of terne.

Two coke tin sets are making a special grade of bright tin adapted for canners' purposes, and it is expected that the whole of the 23 stacks will soon be in operation.

At right angles to the western end of the tin house is situated the sorting and packing department, a fine light room of large proportions, fitted with sorting tables on three sides, the fourth accommodating the stamping machines. Here a number of experienced assorters are busily engaged in their apparently monotonous task, while the packers carry on their part of the work in the center of the room; the boxes when filled being transferred to the warehouse and shipping department, a two-story building at the southwest angle of the works. The upper floor is used for the manufacture of boxes. Adjoining the warehouse and fronting

Fig. 2.—Interior View of Tin House.

in use are four old-style sets, without rolls or machinery, in which are made Taylor's Old-Style terne plates, carrying, it is claimed, as heavy a coating of metal as can be deposited. We are informed that no wasters of this grade are sent out, and each plate is stamped and guaranteed. The cost of production is expensive and the process of coating somewhat lengthy, each sheet being passed through no less than seven pots—three tin pots, two grease pots, one dipping pan and a list pot, in which the edge of the sheet is dipped. Eight workmen are employed on each of the Old-Style pots.

Four Morewood sets with three metal and two grease pots are employed on Taylor's Roofing Tin, another of the company's special grades of terne, also produced by the pure palm-oil process. Four other Morewood pots are in use for operating bright tin plates, being of similar description to those just mentioned. Besides these pots, in all of which the pure palm-oil process is employed, four machine pots Tasker street are the offices, which complete the tale of the buildings so far as they are at present finished. A very judicious arrangement obtains in that the different departments are so planned that the whole process of manufacture goes on in a regular progression. The raw material is received at one extremity of the works, and goes through the various stages without any backward steps, until it emerges a finished article ready for shipment at the opposite end.

SCRAP.

United States Iron & Tin Plate Mfg. Company, Demmler, Allegheny County, Pa., have forwarded us a copy of a pamphlet relating to their manufactures, which also contains much useful information in regard to sheet iron and tin plates. The brands of Monongahela, U. S. A. M. and J. H. sheet iron and sheet steel are fully described, as well as the U. S. bright tin plates, U. S. Eagle terne plates, U. S. Redipped ternes and U. S. Monongahela ternes, all manufactured at the company's works. Lists of sizes, weights and prices of the different plates are given, also tables of sheet iron gauges according to the Birmingham scale and that proposed by the Amalgamated Association, as well as the Brown & Sharpe gauge. A further table is included, showing the comparative weight of metals. The U. S. dripping and bread pans are illustrated, with lists of sizes and prices, and several ruled blank pages for notes are interspersed between the printed leaves. A view of the company's mills is shown on the last page.

We learn from the Baltimore Sheet Iron & Tin Plate Company, Baltimore, Md., that they began operations at their works at Canton, near Baltimore, on January 2, and expect to have four sets at work before the end of the month with a productive capacity of 1800 to 1900 boxes per week. Their brands are Arto Siemens bright tin and Lily terne. The company are identical with the Cwmfelin Tin Plate Company of Swansea.

The next move is in the direction of South America and Australia, to whom Government agents will be sent, and it will be seen whether Canada can offer more advantageous terms than those which now exist between the United States and countries which have recently formed new treaty relations. The duty of negotiating with foreign countries is now invested in the new Minister of Trade and Finance.

Several large factories at Findlay, Ohio, are experimenting with crude oil fuel, the natural gas supply being no longer equal to the demand, and at Lima, Fostoria, Bowling Green, Perrysburg and Toledo preparations are making to consume crude oil.

Weekly Prize Competitions.

$25.00.

FOR MORE THAN six months Weekly Prize Competitions ($10) have been an interesting and useful feature of the *Pharmaceutical Record*, a journal issued from this office and devoted to the interests of the drug trade. These weekly competitions have related to a variety of technical and business questions of interest to druggists, and have brought out a large amount of information of much service to the readers of that enterprising journal. In view of the success of this feature we have decided to announce a similar series of Weekly Prize Competitions on questions of interest to our readers, and invite a general participation on the part of the trade. As the object of these competitions is to obtain information which will be of practical service to our readers, and to discuss questions in which they are interested, we shall esteem it a special favor if any in the trade will suggest subjects for such competitions, which, if deemed suitable, we shall take pleasure in using.

In each competition there will be three prizes—a first prize of $12.50, a second prize of $7.50 and a third prize of $5. The prizes will be awarded for the answers which in the judgment of the committee of award are most suitable for publication and of the most general interest. These competitions are open to every one, and it is hoped that there will be a general response from business men. Those intending to compete are reminded that it will not be necessary to write long essays, but that comparatively brief and business-like answers to the different questions will be favorably regarded as meeting the purpose for which these competitions are announced. We shall have the privilege of publishing any or all of the contributions received.

Weekly Prize Competition No. 1.

SUBJECT:

How to Avoid the Accumulation of Dead Stock.

This competition is announced in view of the fact that there is a constant tendency toward the accumulation of unsalable goods in the store as a result of injudicious purchasing, neglect of pushing goods, or from the fact that the goods go out of fashion or become damaged, shopworn, &c. The object of the competition is to draw out suggestions as to how such accumulations of dead stock can be avoided and merchants saved the loss which is frequently suffered from the carrying of such unsalable stock. This competition obviously touches upon such points as the following:

To what extent is it desirable to purchase relatively large quantities of goods, in order to obtain low prices?

Whether it is advisable to purchase new goods, such as novelties, specialties, &c., for which no demand has as yet been established;

What methods may be adopted to push the sale of goods which are likely to become unsalable;

Whether it is advisable to sell season goods, such as Stoves, Skates, Refrigerators, &c., at reduced prices, rather than carry them over to the next season;

How to get rid of dead stock.

The following prizes will be awarded:

First prize	$12.50
Second prize	7.50
Third prize	5.00

Replies are to be received not later than February 4, 1893. They should be addressed as follows:

DAVID WILLIAMS,
96–102 *Reade street,*
New York.
Weekly Prize Competition No. 1.

Another subject will be announced in our next issue.

The Balance of Trade.

One of the most puzzling questions which confronts those who aim to study our trade movement is the "balance of trade." The fact that it has been apparently in our favor for years without bringing us large shipments of the precious metals, and of gold in particular, may seem inexplicable to a good many business men.

The figures just issued by the Bureau of Statistics show that the excess of exports over imports was $68,518,275 in the fiscal year ending June 30, 1890, that it was $39,564,614 for the following year, and rose to $202,875,686 in the fiscal year ending June 30, 1892. In other words, the export movement of merchandise in three years apparently exceeded the imports by nearly $310,000,000.

In the precious metals the excess of exports was $18,172,094 in 1889–1890, $72,694,195 in 1890–1891, and $13,351,346 in 1891-1892, or a total of excess of exports in three years of $104,217,635. From this must be deducted an excess of imports of silver and gold in ores and matte of about $22,000,000.

Here, then, we have an apparent excess of exports over imports of very nearly $400,000,000 in three years. Even this does not cover it all, because, as is well known, our export statements of merchandise do not cover the total shipments, overland, to Canada and Mexico, and because, notoriously, a good many goods for certain countries are not invoiced at their full value.

But even waiving these points, we are confronted with a "balance of trade" in our favor of nearly $400,000,000 in three years. The usual explanation given is that this account has been balanced by the return of American securities. It has become quite the fashion to allude to this surrender of the holdings of foreign capital in American railroads and industrial undertakings as one of very great magnitude, and hundreds of millions are glibly transferred to this side of the Atlantic in this manner.

We believe that this is taking a very exaggerated view of a movement which, undoubtedly, is taking place. We are led to this opinion because we are convinced that the value of our imports is very greatly understated. On all articles on which an ad valorem duty is assessed the invoices, upon which the import returns are based, are given in the market values at the point of origin. On goods upon which a specific rate is levied, the temptation to invoice as low as possible is not so great. Still the figures at which the valuations are entered in our import statistics are very far below the prices at which settlement must be made. It may be said, in a general way, that the values which go into our import statistics do not include a large share of the profits of foreign producers, which we pay. They do not take into account the cost of inland carriage abroad nor the ocean-freight moneys which we must pay.

It is generally recognized that there are two minor causes which contribute to swelling an apparent balance of trade in our favor. These are the remittances on account of interest and dividends on foreign investments and the sums drawn from home by Americans living abroad.

It is safe to say that the undervaluation of our imports and the amounts forwarded abroad sweep away a goodly share of our much admired balance of trade and leave the great flood of returning American securities a stream of relatively modest proportions.

New Publications.

THE A B C OF IRON. By Charles W. Sisson, Louisville. Ky. Price, $2.

It was a very praiseworthy undertaking on the part of Charles W. Sisson of Louisville to place before the founders of the country a popular statement concerning the properties of pig iron. The publications of those who have been the leading investigators of the relations between the chemical composition of pig iron and its proportions, so far as they affect the founder, are somewhat obstruse, and Mr. Sisson has attempted to popularize their work, and has succeeded admirably. His brief account of the methods of manufacture of pig iron is good. The short chapters on the constituents of pig iron and their effect upon the strength, fluidity, shrinkage, &c., of castings will be read with a great deal of interest and should be thoroughly studied by those whose principal business is to produce good castings at a minimum price.

Mr. Sisson takes strong ground in favor of grading pig iron by analysis rather than by fracture. His argument is sound, and will meet with the approval of all progressive men. We have no doubt that furnacemen will generally second his efforts in the heartiest manner and will welcome his aid, because it does missionary work where it is most needed—among the founders themselves.

It is only a little over a year since that a leading pig-iron producer in eastern Pennsylvania had his views based upon analysis vindicated in a very striking manner. One of his best customers, a neighbor, came to his works to order some No. 1 iron. The furnace manager urged him to take some metal which looked like rather poor No. 2, and after determined opposition overcame this customer's scruples. Not long after a further round lot of "the same stuff" was ordered, because, as predicted, it was carrying scrap in an exceptional manner, and yet was making excellent castings. The furnace manager furnished an explanation by the simple statement that the particular lot of poor-looking iron ran quite high in silicon.

Success in this direction, so greatly to be desired, can only be attained when founders begin to recognize the value of a chemical laboratory and co operate with the furnacemen in comparing results. We know of cases in which mixtures have been cheapened dollars a ton of castings by chemical study. A first step in that direction is that founders familiarize themselves thoroughly with the first principles, and we know of no better means to accomplish that end than to give Mr. Sisson's neat work a careful perusal.

STOVE TRADE NOTES.

American Stoves Abroad.

We referred in a recent issue of *The Metal Worker* to the fact that a leading coal and iron company in this country are making a strong effort to introduce anthracite coal in the markets of Europe. It was also intimated that, simultaneously with their shipments of fuel, the company has forwarded a number of American stoves in which to burn it. Information has since reached us that several stove manufacturers are considering the matter and will probably take advantage of the next consignment of anthracite to ship stoves of their production, with a view to opening up a foreign trade in these goods.

The outcome of this venture is, as yet, uncertain. But it is quite possible that a new field of supply may be opening out for the American stove manufacturer "on the other side." Indeed, such a field is already open, and has been so for ten years past. A dealer in one of the Eastern States successfully launched a consignment of stoves on the European market some 12 or 14 years ago; and they obtained so favorable a reception that an active demand for his goods has existed there ever since. Protected by patents, these stoves have been made in France for years, from American patterns sent over to that country; and the original owner has been and is drawing a royalty on all goods produced. Thirty thousand stoves are said to be in use in Europe at the present moment which have been made from these patterns. Three hundred were shipped only the other day, direct from this country, in response to an order from Switzerland. A leading Western concern have, we are told, been able to place some thousands of their stoves, made in America, on the European market.

These facts hold out a promise of success for the new attempt. Should the endeavor now being made to introduce our hard coal into Europe turn out well, the market for American stoves, which evidently does not exist there, is likely to receive a decided impetus; and possibly an outlet for surplus production in this line may be secured. Up to the present, the low price of labor and material in Europe has prevented the establishment of any permanent business in stoves manufactured on this side. But, with pig metal at the price at which it is now being sold, that difficulty is less formidable than it was some years ago. Mr. Sargent of New Haven made the statement at the hardware dinner in New York last February that, from personal investigation, he was convinced that, because of their superior skill, his American workmen could turn out more work, at a lower cost, than any European workmen. The same conviction has been expressed by others who have examined into the question. If this is true, there seems to be no reason why our surplus stocks should not be marketed in foreign countries. The first step is to show them our goods, and if the price is not too high there should be no difficulty in finding a market, even for the actual American manufactured article.

The use of American stoves may perhaps become the fashion, and these appliances acquire a name and reputation leading to their permanent adoption in some parts of Europe.

The Wrought Iron Range Company.

In a recent issue of the St. Louis *Globe-Democrat* we find the following item relative to one of the leading stove concerns in that city:

St. Louis continues to show a rapid and healthy increase, both as a commercial and manufacturing city. Statistics recently printed indicate that St. Louis is the largest tobacco manufacturing center in the world, while in the production of boots and shoes it is fast approaching and passing other cities which are noted in this line.

In the manufacture of steel ranges there is no city in the country, or, in fact, in the world, which approaches St. Louis in the production of this line of goods. The manufacture of ranges cannot be mentioned without referring to the Wrought Iron Range Company, whose plant occupies an entire city block from Nineteenth to Twentieth streets, and from Washington to Lucas avenues.

This company commenced operations over a quarter of a century ago, and by a careful attention to the details of the business, and catering to the wants of the people, have achieved a remarkable success, and are to day the largest manufacturers of ranges in the world.

As an evidence of the immense amount of business which this concern are doing, a contract which they have just made with the Missouri Malleable Iron Company is worthy of mention. The contract referred to is doubtless one of the largest, if not the largest, of its kind ever made, and will in round figures amount to over $1,000,000. To enable them to properly handle this work the Missouri Malleable Iron Company have erected an extensive plant, utilizing 15 acres of ground, a portion of which is to be used exclusively for this work. Their plant is equipped with all modern appliances, regardless of cost, and is the finest in the world. They are making malleable iron under a new process which can be hardened and tempered, and in fact has all the qualities of the best open-hearth steel. They have added largely to their force, as it will require between 500 and 600 men, principally skilled mechanics, to turn this work out, thus affording steady support of a liberal character to at least 2000 persons, who in turn patronize the merchants and dealers of St. Louis.

In their own plant the Wrought Iron Range Company employ a force of over 300 hands, to whom they give steady and lucrative employment. They also keep in the field over 400 traveling men, who introduce and sell the Home Comfort steel ranges and furnaces throughout the entire country. In addition to their home trade they ship large quantities of ranges to Mexico, Central and South America, and to other foreign countries. Their trade with Canada has lately grown to such proportions that they have opened a branch factory at Toronto, Canada, where they manufacture a full line of their goods and ship direct to Canadian points.

The entire business is a St. Louis enterprise, inspired and controlled by St. Louisans, and is an establishment of which the city can well be proud.

ODD PLATES.

The Quick Meal Stove Company, St. Louis, Mo., manufacturers of the Quick Meal gasoline and gas stoves, have issued their annual calendar, which will be found useful as well as ornamental. The calendar proper is composed of separate sheets with the week days only appearing thereon, and memorandum space opposite each date for jotting down reminders of daily duties. The back of the calendar is of tin, tinted green, and has the well-known trade-mark of the Quick Meal Stove Company thereon. This calendar will be appreciated wherever received, and the company sending them out are to be congratulated upon securing such good advertising matter.

E. B. Morse, a man entirely familiar with stoves, of Salamanca, N. Y., has accepted a position with the Howe Ventilating Stove Company at Cortland, N. Y.

A. F. Glaessner, for a number of years connected with the Union Stove Works, 70 Beekman street, New York, will continue to visit the trade in New England and New York State in the interests of this concern. Just now Mr. Glaessner is resting at his home in Meriden, where he has quite a collection of high-bred chickens in which he is much interested.

It is not so very long since that the insurance companies throughout the East refused to accept policies where gasoline stoves were used except at a greatly increased premium. That this manner of doing business is getting more or less obsolete is evidenced by the fact that the Quick Meal Stove Company, St. Louis, Mo., have appointed S. M. Howe's Company, Boston, Mass., agents for the sale of their Quick Meal gasoline stoves in that section. This is evidently the opening wedge, and before long the sale of gasoline stoves in the New England States will doubtless be as large as in other parts of the country.

Frank L. Voegtly and John Schroeffel of Allegheny, Pa., have been granted a patent for an open-front stove possessing interesting features of construction. On each side of the grate are vertical rods or bars, on which, at suitable intervals apart, is a series of projections. A front or blower provided with lugs is so placed as to engage with the projections, while wings or flanges formed on the ends

of the blower or front are adapted to engage with the inner faces of the rods or bars in such a way that the rods or bars act as guides for the blower and retain it in a vertical position. Mr. Schroffel has assigned his interest in the patent to Mr. Voegetly.

JOHN M. HARMON, who has had charge of the storage loft of the Bussey & McLeod Stove Company of Troy, N. Y., for 12 years, died suddenly on January 4. of heart disease, from which he had suffered for some time. Mr. Harmon was 72 years of age. He was sexton of the United Presbyterian Church and was well thought of. He leaves a widow and three sons.

THE SUPERIOR FURNACE COMPANY Little Falls, N. Y., have had a very prosperous year, and are now taking inventory and making repairs. Their sales of heaters during 1892 showed a large increase over the year previous and the prospects indicate even a larger business this year. The volume of trade has become so large that it is understood an increase in producing capacity will soon be necessary. The question is at present being considered by the officers and board of directors.

THE ANNUAL MEETING of the stockholders of Superior Furnace Company was held at the office of the company in Little Falls, N. Y., on Tuesday, January 10. The report of General Manager W. H. Switzer for the past year showed the company to be in a most prosperous condition. The following officers were elected to manage the affairs of the company for the ensuing year: President, Watts T. Loomis; vice-president, W. W. Whitman; treasurer, Wm. G Milligan; secretary and general manager, W. H. Switzer. The company is to be congratulated upon the re-election of Mr. Switzer as general manager, for a more faithful and efficient officer would be hard to find.

BEAILEY WOODRUFF of Milwaukee, formerly of Rochester, N. Y., has been visiting in the latter city. He is on his way to Philadelphia, where he will enter the employ of the Abram Cox Stove Company.

E. J CRIDGE of Detroit, Mich., who has been superintendent of the Michigan Stove Company's works at that city, is visiting in Troy. Mr. Cridge is considering an early return to his old home. He is very popular in Troy and is an ex-Alderman of that city. His many friends are pleased to note his good health.

W. L. MERSFELDER, proprietor of the Cincinnati Pattern Works, formerly at 177–181 E. Pearl street of that city, owing to the rapid but steady growth of his patronage, has been compelled to seek larger quarters, and on the 1st inst. removed his shops to 140–150 E. Front street, one square south of former location. The change provides double the former capacity and decidedly increased advantage.

WE UNDERSTAND that a slight fire occurred in the Lansdale works of the Abram Cox Stove Company a few days since, but the flames were extinguished before any important damage had been done.

FOUR CARTON FURNACES have been placed in the buildings owned by Backert & Tempert on Oakdale avenue, by Jacob Retterer, 83–85 Wabash avenue, Chicago.

D. S COOK, F. W. Stevens, A. Midgley and O. P. Chamberlain are named as the incorporators of the Invincible Mfg. Company, at Chicago, authorized to manufacture gas and gasoline machines, stoves and burners. The introduction of natural gas into Chicago has created a demand for natural gas appliances, and D. S. Cook, as the agent of the Chicago & Erie Stove Company, is fully prepared to meet the necessities of natural gas consumers with specially devised apparatus for the use of that fuel.

FROM THE MICHIGAN STOVE COMPANY we have received this week an advertising device in the form of a water-proof card, 9 x 10 inches in size, on which is printed in black letters on a white background the injunction, "Post No Bills." The company state that these signs will prove very acceptable to persons having fences or other places where they do not wish bills posted. As the sign bears a conspicuous reproduction of the company's Garland trade-mark, it thus becomes an attractive and lasting advertisement of their line of stoves and ranges.

A HANDSOMELY ENGRAVED CIRCULAR, adorned with a portrait of the late P. D Beckwith, and issued by the Beckwith estate of Dowagiac, Mich., informs us that in his honor the Beckwith Memorial Theatre will be opened January 20 and 21 by Mlle. Rhea and formally dedicated January 25 by Col Robert G. Ingersoll. Mlle Rhea and her company will present "Much Ado About Nothing" and "Josephine, Empress of the French," on the two evenings respectively mentioned, and Colonel Ingersoll will lecture on Shakespeare. We observe that the price of boxes ranges from $6 to $15. and of seats from 50 cents to $2, according to location and with regard to the character of the entertainment. These prices will give the outside world some impression of the high character of this temple of amusement as well as the wealth of the community in which it is located. And the fame of the Round Oak stove is thus perpetuated.

JACOB RETTERER, 83 and 85 Wabash avenue, Chicago, now represents the Victor Stove Company of Salem, Ohio, Keeley Stove Company of Columbia, Pa., Empire Stove Works of Troy, N. Y., and the Carton furnaces.

THE FULLER-WARREN COMPANY of Milwaukee, Wis, favor us with a sample of the very neat wall calendar which they are distributing to the trade. It bears a pretty seaside view lithographed in bright colors, representing two sweet-faced children hiding from their companions behind the shelter of a convenient rock. Leaflets for the months are attached to the card bearing this picture. Each leaflet carries a line referring to P. P. Stewart stoves and ranges. On the reverse of the card is printed a full daily calendar for the year, a list of the various products of the company and also a list of their branch offices in various parts of the country.

ACCORDING TO A PRESS DISPATCH from West Superior, Wis, under date of January 3, some of the molders of the Superior Stove Works went out on strike the day before. It is stated that John D. Green, manager of the company, announced a reduction of 10 per cent. in the wages of the molders, but the men refused to accept the proposition and 35 went out. We understand that other departments of the works are not affected.

KNOWLTON BROTHERS of Camden, Me., have recently commenced the manufacture of cast-iron stoves, for which a good demand had developed The construction is said to be very economical in the use of fuel and is a powerful heater.

IT HAS BEEN the custom of the Ringen Stove Company of St. Louis, Mo., for a number of years to present their friends in the trade with a calendar and the year 1893 is proving no exception. The company have just sent out a very convenient calendar and daily reminder combined, mounted upon a metal easel, the top of which is embellished with the name of the company and an indication of the line of goods manufactured. The easel is finished in colors and is also furnished with an eye so that it may be hung upon the wall if desired. The days of the week and month are arranged down the left of the pad, constituting the calendar proper, while the greater portion of the width of the paper is ruled for purposes of memoranda.

THE CALENDAR for 1893 which is being distributed by the Co operative Foundry Company of 15 Hill street, Rochester, N. Y., differs somewhat in its general make-up from those which are being sent out by other members of the stove trade. It takes the form of a poster, with metal strips at the top and bottom, and an eye for suspending it upon the wall. The greater portion of the hanger is occupied by a picture of a cosy interior, one of the features of which is a Red Cross base burner under full head of steam, if one may judge from the fiery glow of the mica lights. The picture is lithographed in bright colors, producing a rich effect. Directly beneath the stove in large blue figures appears the date 1893, while at the right and left are the names and addresses of the managers of the Milwaukee and Chicago warehouses. The 12 leaves forming the calendar proper are attached to the lower portion of the poster and framed in an oblong panel partially lost in a design of flowers. The days of the week and month are printed in clear black upon a white ground which enables them to be seen at some distance. There is also given in connection with each month the various phases of the moon.

HESSLER & SCHAFER of Syracuse, N. Y., send us a copy of a catalogue which they have recently issued of stoves, range and furnace repairs. It consists of nearly 100 pages, bound in stiff covers with gilt side title. The list of repairs printed are kept in stock and can be furnished with celerity and dispatch. The firm state that they have long lists of patterns for stoves for which there is but little call. They do not keep such repairs in stock, but can furnish them on short notice. Arrangements have been made with several large stove manufacturers to furnish the firm with all parts of their stoves, thus enabling the trade to be supplied with original castings at reasonable prices. Directions are given for ordering repairs and remarks concerning freight and breakage. The names of the stoves for which repairs can be furnished are arranged in alphabetical order, followed by an indication of the kind of stove, the name of the manufacturer and the parts which can be supplied. We also have from the firm a two-fold circular relating to the Andes stoves and ranges. On opening it we find the center panel occupied with an illustration of one of these constructions which are said to be "The best cookers and bakers made." The left-hand panel is occupied with an excellent likeness of H. E. Hessler, while at the right is a reproduction from a photograph of G F. Schafer.

AT A MEETING of the directors of the Auburn Stove Foundry Company held at Auburn, Maine, on Thursday, December 29, it was decided to erect a 30-foot addition to their plant. We also understand that at this meeting a semi-annual dividend of 3 per cent. was declared.

THE DETROIT STOVE WORKS, Detroit, Mich., have a well-organized staff of traveling salesmen who will look after their interests during the new year. The list includes G M Sovereign, who will visit the trade in New York and Pennsylvania; George W. Patterson, who will travel in Western Ohio; George S. Grey in Indiana; James G. Insole in Eastern Ohio and Western Pennsylvania; George Fifield in Southern Michigan and Northern Indiana; J W. Thorn in the State of Michigan; H. A. Furber in Detroit and

its suburbs; H. W. Peak in Texas; M. C. Bennett in Nebraska; C. H. Conner in Minnesota and South Dakota; R. J. Millar in Michigan, Northern Dakota and Montana; William Randell, in Southern Illinois; W. J. Anderson in Northern Illinois; George F. Cady and F. Goldsmith in Chicago and its suburbs; A. B. T. Moore in Eastern Iowa; P. C. Jones in Western Iowa; H. D. Bell in Wisconsin; Theodore Gale in Missouri; C. F. Dietrich in Kansas; H. D. Schall in the Southern States and P. K. Armstrong in the far West.

THE HERSH FURNACE COMPANY, Leighton, Pa., have brought out a calendar for the new year mounted upon a cardboard measuring 11 x 14 inches in size. The name and address of the company are printed in large blue letters on a white ground and occupy the upper half of the card. The lower panel, inclosed by heavy blue lines, carries the calendar proper, which consists of 12 white sheets upon which in black letters and figures appear the days of the week and month and the various phases of the moon. The thirteenth sheet, on a tinted paper, contains a calendar for the year.

THE FAVORITE STOVE & RANGE COMPANY of Piqua, Ohio, and with branch establishment at St. Paul, Minn., have just issued a very neat catalogue illustrating the Favorite gas range. The stove is made in a great variety of styles and sizes, under a uniform design and embodying the latest improvements. One of the features to which reference is made by the manufacturers is the perfectly fitting joints, doors, &c. The castings, fittings, ornamentation, &c., are of first-class workmanship, while the ovens are of good size. All the burners are operated with steel needle point valves with stop to prevent thread from entering the packing. The hot-water heater which is attached to some sizes of the Favorite is of good capacity and is arranged with two cooking holes. The Favorite is made with two, three and four burners in the top surface, some sizes being fitted with hot-water heater, others with a double burner and attachment, while still others have a combination of the two. The ornamentation is exceedingly attractive, and the constructive parts are so arranged that any kind of gas may be employed as a fuel.

THE VICTOR STOVE COMPANY, Salem, Ohio, will be represented during the year 1893 by I. Ritterer, who will cover the territory west and northwest of Chicago; Louis Waldecker, who will look after the interests of the company in Indiana, Eastern Illinois and Michigan; R. A. Thompson, who will travel in Ohio and Western Pennsylvania, and Charles Koll, who will cover Southern Ohio and Western Virginia.

THE STOVE FOUNDRIES of Taunton, Mass., have been busier during the past month than for the corresponding period in a number of years. The foundry of O. G. Thomas, which usually shuts down about New Year's in order to take account of stock and make repairs, will not be able to cease operations for some weeks as yet owing to the rush of orders.

WALTER G. SEELY, alderman of the Fourth Ward, Detroit, Mich., has been appointed general manager of the Sherman S. Jewett Stove Company, Buffalo, N. Y. Mr. Seely has been manager of the Detroit branch since 1872, when it was established. He entered the stove business at Buffalo, traveling for John C. Jewett, through which connection he became acquainted with the officers of the Sherman S. Jewett Stove Company, and was engaged by them to establish the Detroit branch. It is also interesting to state in this connection that Mr. Seely's son, Walter G. Seely, Jr., has been appointed to take charge of the Detroit office. Mr. Seely will enter upon his new duties at once, but has not yet determined whether he will remove his residence from Detroit

CHARLES C. HEATH & Co. of Baltimore, Md., send us a copy of a very pretty calendar which they have issued for the new year. It consists of a piece of white cardboard measuring 11 x 14 inches, the upper portion of which is occupied with a steel engraving entitled "The Deluge." Above this is the inscription "The Ideal Furnace," while below is the name and address of the concern printed in chocolate-colored letters. The 13 slips forming the calendar proper are printed in an ink of a bluish tint upon a white ground, there being a sheet for each month and one carrying a yearly calendar. At the left is a list of the company's line of fire-place heaters, while at the right are the names of a number of ranges which the company are producing. Considered as a whole, the calendar is very neat and attractive and is likely to be appreciated by those into whose hands a copy may come.

THE GEM CITY STOVE MFG. COMPANY of Quincy, Ill., are distributing to the trade an attractive calendar for the new year embellished with a panel picture entitled, "Fight for the Standard," by the artist Ansdell. This occupies fully one-half of the card, which measures 7 x 14 inches in size. Below the picture is the name and address of the company, and attached to the lower portion of the card is the calendar proper, consisting of 12 leaves, upon which the days of the week and month, together with the moon's phases, are printed in black.

THE BRIDGE & BEACH MFG. COMPANY of St. Louis, Mo., are much pleased with the volume of business during the year just brought to a close. Out of 305 possible working days they operated their works with a full force on 295 days, the ten-day shut down being for inventory and necessary repairs. The company have a capacity of 180 molding floors and it was necessary to keep the department under full headway the entire year in order to supply the demand for their line of superior stoves and ranges. The company are making preparations for a still larger increase in their business for the ensuing year, and on Tuesday, January 3, the works started up with a full force in all departments.

THE CULTER & PROCTOR STOVE COMPANY of Peoria, Ill., will have a force of salesmen on the road during the year 1893, consisting of C. H. Cowles, who will look after the trade in Illinois; L. H. Loomis, who will cover Illinois and Indiana; John C. Hoagland, who will visit the trade in Southern Iowa and Missouri; Charles Rentz, in Missouri and Iowa, and Frank Bosworth, in Minnesota and South Dakota. The company have a new line of four-hole coal and wood ranges, which will be offered the trade this season.

SAM S. UTTER of 113 Beekman street, New York, and with Boston office at 12 Pearl street, sends us a copy of a neat catalogue of 36 pages which he has issued relating to oil stoves of various descriptions. The little pamphlet is printed in tinted ink and bound in colored covers, with gilt side title. The opening pages are devoted to the Game lamp stoves, in which the oil tank is made in one piece, while the wick tube is in one piece, of brass, and removable. Following this construction attention is invited to the Summer Girl, a neat lamp stove made in three sizes, having 1, 2 and 3 burners. The oil tank is cast in one piece, while the wick tube is of chilled cast iron. The feeder cap and wick raiser are of brass. Next in order is the New Game oil stove, shown in a great variety of sizes, the Star Heater and Illuminator, the Ladies' Delight, and sad iron heaters for burning gas. Full directions for using oil stoves constitutes a feature of the work.

THE DANGLER STOVE & MFG. COMPANY, Cleveland, Ohio, make a number of strong claims for their line of Dangler stoves and ranges, stating, among other things, that they possess every desirable feature essential to satisfactory operation. Special reference is made to the Dangler Surprise and also to their New Cabinet range. Their New Process is said to be a novelty in design and is very attractive.

A. WEISKITTEL & SON, Baltimore, Md., are pushing with a great deal of enterprise the sale of their Patapsco six hole range, made in three sizes and the usual varieties. The firm say they have been manufacturing this range the past 35 years and have yet to hear the first complaint.

GEORGE M. CLARK & Co. of Chicago, Ill., state that the Process stove for 1893 is the Jewel of 1892. It is referred to as being very attractive in appearance, satisfactory in operation and well made in every particular.

WILLIAM H. SHEAR, New Scotland, N. Y., sends us a circular of his patent pedal attachment or oven-door opener, which has proven so popular with the stove trade. The merits of the device are carefully set forth and a comprehensive description of its construction and operation presented.

MCLEOD & HENRY COMPANY of Troy, N. Y., have issued a New Year Greeting, in which reference is made to an idea which they say has long been clear in their minds, and the object of the greeting is to make it clear in the minds of the trade. This idea is that the company "make the best goods under the sun" in their line of business, which is the manufacture of New Process fire-proof linings. The greeting winds up with the quotation, "To us the idea is so clear, so shining, so evident, that it will glimmer through a blind man's eye."

Changed Conditions in the Stove Trade.—II.

BY STOVEMAKER.

With the incoming of 1879 the tide turned and the autumn of that year brought the first edge of prosperity to many industries that had languished for five years. Railroad building had taken a fresh start, iron goods were advanced in prices, the stove trade started upward with a boom, and prices rose to something like a paying basis. Old men of business, noted for their great sagacity, brilliant plans and bold business ventures, who had felt themselves tied hand and foot and compelled to let their business simply take its course during the years of decreased demand, scarcity of money and depreciation of values, were stimulated to greater activity than ever and the determination to reap all the benefit and advantage possible from the revival of trade.

The working people, who had suffered through the long years of depression, deprived of not only the luxuries, but of the necessaries of life, felt the influence of the general cry of better times, and set about to get many things of which they had previously been forced to deny themselves. It seems unquestionable that they were tempted into indiscretion in the matter of contracting debts, as the houses adopting the partial payment plan, which had come into existence at this time, were patronized more generally than ever before.

These installment furniture houses were phenomenally successful, and, to take the tide at its flood, they added to their stock in trade anything and everything in reason which they might sell to housekeepers along with their furniture. What they introduced affecting the stove business were stoves themselves, and all the utensils and appurtenances thereto except the repairs;

in fact, they took in practically the whole business of the ordinary stove dealer.

FURNITURE HOUSES SELLING STOVES.

Previous to 1879 there were probably not more than a dozen furniture houses selling stoves in all New York City and surrounding towns, whereas to-day there are thousands. In fact, it is exceptional to find one that does not sell stoves and fittings.

The disturbance to the regular trade was not generally felt at first, only those complaining whose near neighbor in the furniture line went in the stove business, but it spread to all sections and cities in the course of a few years, crowding out the old-line dealers one after another either completely or else causing such a reduction in their stove business that they were no longer factors in the trade. During the three or four years of good demand in stoves after the boom of 1879 the loss to the old-time dealer was not seriously felt; but as soon as the trade settled back the changes that had been going on were noticeable to an alarming extent. Many of the dealers more distant from the trade centers, who had always done a good local business, were astonished at the falling off in their custom and were unable for a long time to account for it. Complaints more or less bitter were lodged against the wholesalers for selling to furniture houses on the ground that they were not legitimate dealers, but the manufacturers could hardly see it in that light when such concerns formed a large proportion of their customers, and considering, too, that supply must follow where demand leads

Old-time city dealers who ten years ago gave stock orders in the fall for from 100 to 200 stoves, which they piled away in their cellars and warehouses, found their trade reduced from year to year and their order to the salesman smaller and smaller, until finally they met the agent making his annual call with the remark: "No more stock orders for me; I will order as I want." Many have become so disgusted that they have given up stoves entirely and confine themselves to jobbing, tin work and roofing.

The furniture houses are not alone responsible for curtailing the trade of stove dealers, however, as many of the large department stores have established stove departments, and while they always sold house-furnishing goods, it is easy to see how much more custom they are taking away from the smaller stores on such utensils by selling the stove itself. They have injured not only the city dealers, but the country dealers as well, as many such stores make deliveries with their own wagons anywhere within 25 or 50 miles of New York.

The evils that have sprung up on account of this freak of trade are many, and while they have fallen most heavily on the retail stove dealers, the manufacturers have also suffered. The people have not burned up any more stoves because others sold them, hence nothing has been gained, but, on the other hand, the scramble after the trade by wholesalers when furniture men started to sell stoves encouraged a host of concessions and inducements that have proven to be very costly indeed. The traditional customs of the trade were unknown to these people, and they refused to be educated up to them. They proposed going into the stove business at the smallest possible bother to themselves, and would not put up with such annoyances as deigning to black stoves, pay the expressman every time he delivered them, pay for any breakage in transit or for any screws or bolts that may have become lost on the way, while the number of salesmen, the frequency of their visits and their persistency in trying to sell goods led them to believe that they could avoid all such detail, having those things conceded, if not by one firm then by another.

OLD AND NEW LINES OF COMPETITION.

Hence the old lines of competition have all been broken up. Arguments that used to prevail with the stove dealer are found to be beyond the comprehension of the furniture dealer. The arrangement of the flues was of no more account to him than the arrangement of the salesman's hair, and the size of ovens and fire boxes had nothing to do with the case. What they wanted to know from the salesman was, how cheap he could sell a 7-inch range, the length of time allowed for payment and what other inducements he could offer? Competition being thus defined, abuses crept in that have cut deep into the wholesaler's profits and which will take another revolution to reform. Things scarcely to be thought of ten years ago in the nature of concessions are matters of ordinary trade now. Free delivery, free blacking, free castings to repair breakage, free bolts and nuts and the privilege of returning unsold heating stoves at the end of the season, are among the many concessions made by the wholesalers from time to time that are now recognized as settled conditions in the sale of stoves. Besides all this it has not infrequently happened that wholesalers have been obliged to send workmen to distant places to repair stoves which through the ignorance or neglect of the furniture dealers' employees to loosen the bolts have cracked with the first fire, not from any imperfection in the casting itself. To decline compliance with such a request would endanger the customer's trade and an explanation from the wholesaler of the custom in the trade regarding such cases would be entirely useless Calls have also been made on the wholesaler to send a man to look at a stove which some person had complained did not work right, and on account of which installment payments were withheld; an expert has been sent simply to find that the stove was either improperly set by an incompetent man or had been purposely abused by the owner himself. A charge for such little services would call forth an indignant protest from the dealer.

PRICES.

In addition to all this prices have been cut and slashed in order to get custom among such dealers. Cutting of prices is not a new element in the stove business by any means, but in the midst of all the other innovations that have cropped out during the new era of the stove business, cutting of prices has not taken a back seat, but has come in for its full share of recognition along with all the rest.

INCREASED COST OF DOING BUSINESS.

It should be stated perhaps that there were and are many exceptions to the class of furniture dealers referred to, who have fully equipped stove departments with competent superintendents and practical workmen to whom some of the remarks made do not apply. Their trade being larger, the delay caused by ordering stoves blacked would be unprofitable and their demand such that small deliveries were unnecessary. But, excepting all such, the trade with the main body has fostered abuses innumerable that will take a long time to cure and that only a general advance in prices, warranted by unusual prosperity in the stove industry, will furnish manufacturers an opportunity to cover. It has made more clerical work necessary to do the same amount of business; taken more salesmen to cover the same territory with its added number of dealers, more porters to handle the same number of stoves distributed in smaller quantities, increased the entering and posting of sales, stationery, postage; and hence to sum up, vastly increased the general expense account and lopped off thousands of dollars of profit, and this is but one of the three great convulsions the trade has suffered from 1882 to 1892.

(*To be continued*)

Franklin N. Drake.

Franklin N. Drake, president of the Corning Stove Company, Corning, N. Y., died at 7 o'clock in the evening of December 28, at North Adams, Mass., where he had gone three weeks before to receive treatment for a cancerous development. He underwent an operation, but his system failed to rally from the shock. Mr. Drake was born in Milton, Vt., December 1, 1817, and 12 years later, his father having died, the family removed to Le Roy, N. Y., where he became a clerk in a drug store. He remained three years, after which he went West for a time. Soon after attaining his twenty-first birthday he established a hardware and grocery store in Le Roy, conducting it with success until 1854, when he began the manufacture of lumber at Cohocton, N. Y. In this he was successful, and after a dozen years was reputed worth $100,000 in cash as the result of his perseverance and enterprise. In the meantime he served in various public offices, being elected supervisor several times. In 1865–66 he became interested with the elder John Arnot, Constant Cook, H. H. Cook, Henry Sherwood, F. C. Dimming, Lorenzo Webber and M. P. Bush in a large track of land south of Blossburg, Pa., now known as Arnot. Mr. Drake became superintendent and manager of the property, which became very valuable. Under his administration the company purchased the Tioga Railway, built the State Line to Elmira, N. Y., and he became, as its president, superintendent and manager. He was a director of the Erie Railway for years, and was urged to accept a like position in the Lackawanna, when it was extended to Buffalo in 1880, but did not do so.

He became a resident of Corning in 1867, and, though engaged in many affairs, took an active interest in the progress of the place. He declined public duties, except the office of town auditor. However, in 1881, he consented to become president of the village, and also became a member and the president of the Park Commission. In 1882 he established the only national bank ever organized in Corning.

Mr. Drake married Miss Abigail Manwaring of Bethany, N. Y., in 1840, while a resident of Le Roy. The fiftieth anniversary of the wedding was pleasantly celebrated September 9, 1890, as was Mr. Drake's seventy fifth birthday on December 1. He had three sons and three daughters. His son, James A. Drake, had been his business confidant for years, to whom the business interests will doubtless fall. Mr. Drake was public spirited and regarded with the highest esteem.

A special meeting of the trustees of the Corning Stove Company was held January 3, and an election of officers took place to fill the vacancy caused by Mr. Drake's death. The company adopted the following preambles and resolutions:

Whereas, Franklin N. Drake, president of the Corning Stove Company, has departed this life; therefore

Resolved, That in the death of Mr. Drake the community has lost one of its most influential citizens and business men and this company a wise counselor;

Resolved, That we place on the records of this company this testimonial of our appreciation of him, and express to his family our sympathy in their bereavement.

The commissioners of Drake Park held a meeting the same day and passed suitable resolutions on Mr. Drake's death.

The Corning Stove Company elected the following officers to serve until the next annual election: President, George W. Drake; vice-president and secretary, L. D. Strecter; treasurer, James A. Drake.

PRIZE COMPETITIONS.

WE HEREBY ANNOUNCE a series of six prize competitions relating to trade matters in which our readers are interested. Four prizes of $50, $25, $15 and $10 will be awarded in each competition.

The competitions are open to all and a general participation on the part of the trade is invited.

We shall have the privilege of publishing any or all of the contributions received.

The committee of award in assigning prizes will take into account the merit of the different contributions and their suitability for publication.

PRIZE COMPETITION No. 6.

How Retailers Can Best Advertise and Extend Their Business.

The object of this competition is to obtain practical suggestions as to the methods which the retail dealer in Hardware, Stoves, Tinware, &c., can advantageously adopt in building up his business, and is intended to cover such points as the following:

Advertising in the local papers, with suggestions as to how such advertising should be done and to what extent;
The manner in which circulars and other printed matter may be used;
A description of any special or unusual methods of attracting and holding trade; and
General suggestions in regard to ways in which the business can be extended.

An account of any methods which have been found useful in building up trade will be suitable under this competition.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 6.

PRIZE COMPETITION No. 7.

Travelers' Yarns.

The traveling salesman is proverbially happy in the stories which he narrates, and this competition is for the purpose of calling out a collection of good yarns for publication. While the attention of travelers is specially invited to this competition, it is open to all. Stories relating more or less closely to trade or business matters will be preferred.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams 96–102 Reade street, New York, and marked Prize Competition No. 7.

PRIZE COMPETITION No. 8.

How to Treat Clerks.

Under this competition, beside a general discussion of the subject, such questions as the following may be considered:

The extent to which clerks should be given an opportunity of obtaining a knowledge of the business, and of price-lists, prices, &c.;
Whether it is desirable to have formal rules for the regulation of employees and for the management of the store. If so, a set of rules should be submitted;
To what extent clerks should be held responsible for their mistakes;
Suggestions as to how clerks should be treated in order to secure their most intelligent and efficient work;
Mistakes made in the treatment of clerks.

This competition opens an important subject and it is hoped that it will be discussed fully by merchants and by their clerks from their different points of view.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 8.

PRIZE COMPETITION No. 9.

Shop System of Keeping Track of Jobs.

This competition is intended to call out information in regard to methods of keeping account of the cost of labor and material on tin-shop work, repairing and new work, inside and outside. In connection with the general subject such points as the following may be touched upon:

Whether blanks or forms are used in connection with such work. (If so, samples should be submitted);
What record is kept of orders, costs of jobs, charges, &c.;
How time occupied in going to and from the job is covered;
Suggestions in regard to the profitable conduct of the shop.

To illustrate the system it is desirable that a specific job (as for example, repairing down spouting and eave trough, or other job of repairing in which new material is used) be referred to and the method of keeping track of the costs in such job fully explained.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 9.

PRIZE COMPETITION No. 10.

Business Maxims—At Least 10.

Those entering this competition will send at least ten maxims relating to the conduct of business, presenting in a brief and pithy manner practical suggestions which may advantageously be followed.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 10.

PRIZE COMPETITION No. 11.

How Small Retailers May Keep a Record of Prices.

The object of this competition is to call out information or suggestions in regard to the best methods to be adopted in keeping a record of prices, showing cost or selling prices, or both cost and selling prices, of Hardware, Stoves, Tinware, &c., in a small retail store employing not more than four persons in the selling and bookkeeping departments, including the proprietors. Those entering the competition are expected to give a concise and clear explanation of their system, and if a price book is used, to submit as illustrating the system at least three specimen pages. If a price book is referred to it may be of any design or arrangement best adapted to the purpose, and may be original with the contributor or may be one of the different price books on the market. Fictitious names should be used instead of the real names of jobbers and manufacturers.

The committee in awarding prizes will take into account the merit of the different systems described, the character of the descriptions given, and the general utility and interest of the contribution.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business, February 18, 1893.

Contributions should be addressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 11.

Britton's Floor Jack.

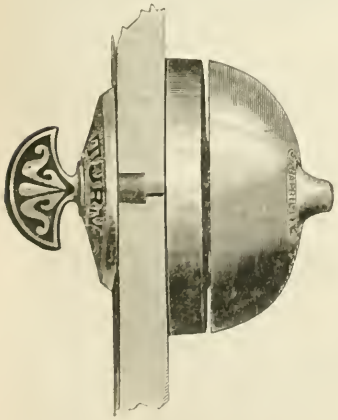
Horace E. Britton, Stoughton, Mass., is introducing this article, as illustrated herewith. It is built throughout of steel, the

Britton's Floor Jack.

lever, sliding wedge and the spike that drives in the floor are nickel plated, the frame japanned and the handle of rosewood. The letter A in the cut represents a small friction roll. The advantages claimed for the jack are that it is quick in operation; that the workman does not have to step off the work to operate it; that it will work within 10 inches of a base board; that by means of the wedge fastening device, every particle of pressure applied is held, and that the spike or dog will not tear the under floor. The tool is compact, taking but little room it can be packed in a tool chest, and is easily moved from place to place, weighing as it does but about five pounds. It is referred to by the maker as light, handy, strong, durable and as an efficient machine.

New Improvement Door Bell.

Hardware Specialty Company, Newark, N. J., have modified the appearance and construction of their New Improvement



New Improvement Door Bell.

door bell, and are now putting it on the market as represented in the accompanying illustration. From an inspection of the latter it will be observed that the company have done away with the old cumbersome base with the lugs for screws on the outside, being now screwed on from the inside by removing the gong. The frame, also, which was formerly japanned, is now highly polished in nickel, so that the entire bell has a nickel finish. The manufacturers call attention to the beauty and neatness of the bell as thus offered. This door bell requires no winding and has no springs.

Immel's Lightning Drain Cleaner.

The Buckeye Mfg. Company, Union City, Ind, are manufacturing this drain tool, as shown in Fig. 1. It is a hand machine to be used as a shovel. The dirt pan is made of No. 18 steel, 3 inches deep

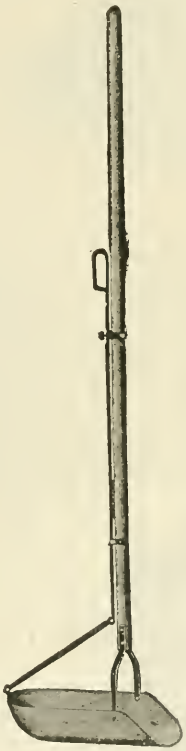


Fig. 1.—Immel's Lightning Drain Cleaner.

and 12 inches long, with vertical end in the rear. It may be used for dipping water and dirt, for letting down tiling

Fig. 2.—Adjusted to Pull.

into ditches, and is found convenient and saves the extra labor of standing and working in muddy ditches. The iron adjusting rod extending up the handle, it is stated, can be used with great rapidity and ease, and can be adjusted to pull or push, as shown in Figs. 2 and 3, as quickly as the hand can be moved up or down the

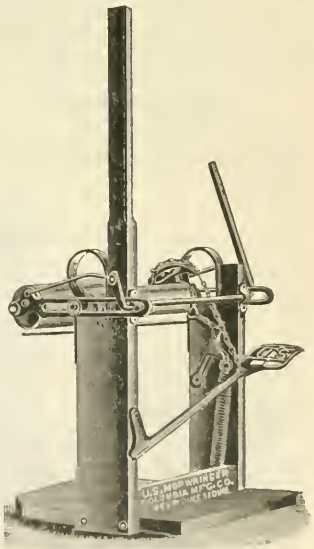
Fig. 3.—Adjusted to Push.

handle. The blade may be held in any position by tightening the screw.

The U. S. Mop Wringer.

The Columbia Mfg. Company, Des Moines, Iowa, have just put upon the market the wringer illustrated herewith.

The base of the wringer is 12 x 15 inches, the uprights are 4 x 16 inches, with a handle or rest extending 15 inches above on the one side, all of hardwood ¾ inch stuff. The two wooden rollers are of unequal size, the smaller one is journaled in two oil-tempered springs and is actuated by foot power. The larger roll is journaled to the horizontal slotted bars, which are mounted on the journals of the small roll and on the outer ends of the clamping lever. In use the rolls are separated by throwing the lever forward. The mop is introduced between the rolls and passed into the bucket below, then raised be-



The U. S. Mop Wringer.

tween rolls, and the rolls are brought together by throwing the lever back, when it becomes automatically locked. By pressing the foot upon the treadle a revolution of the small roll is effected; when the pressure is released upon the treadle the coil spring causes the oscillating segment to return to its normal position, ready for a second stroke. The large roll is driven by its contact with the small roll directly or indirectly through the mop. Five strokes of the treadle are sufficient to drive an ordinary mop between the rolls. Wire guides are provided to prevent the mop cloth passing laterally beyond the rolls. The entire act of wringing a mop can be performed without stooping. Its weight is 17 pounds.

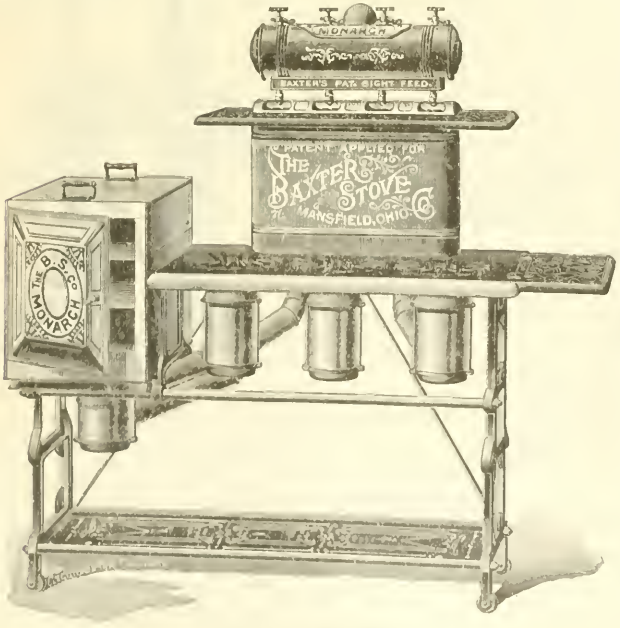
A New Money Drawer.

Tucker & Dorsey Mfg. Company, Indianapolis, Ind., manufacturers of hardware specialties, are introducing a medium-priced money drawer called Tucker's Alarm Till No. 2, illustration of which is shown herewith. The lock and general construction are the same as in the regular old-time Tucker money drawer, but the materials used are somewhat lighter and less expensive. It is intended for a low-price money drawer which will give good service, and bears the same guarantee the No. 1 Tucker's Alarm Till has always had. The company have recently put in improved special machinery for the manufacture of these goods, by which they are enabled to do the best work, and attention is called to the improvement in the workmanship and finish of their product.

Tucker & Dorsey Mfg. Co.'s New Money Drawers.

Monarch Vapor Stove.

In the accompanying illustration we present a general view of the No. 300 Monarch vapor stove, which has been brought out for the season of 1893 by the Baxter Stove Company, Mansfield, Ohio. The special features embodied in this construction include, among others, Baxter's patent sight feed, consisting of mica sections over the top of the vaporizing chamber, thus bringing in sight of the operator the whole internal arrangement and disclosing the dropping of the fluid upon perforated cones. This feature is referred to by the manufacturers as one of great importance and one on which patents are now pending. There is also embodied in the stove a device said to dispense with the heating pipes by a chamber entirely surrounding the evaporating cones, the arrangement being such that great heat is secured and the vaporizing accelerated. At the same time the mechanical constructon is simplified to a considerable extent, rendering the operator much less liable to become confused, while rendering the stove easier to keep clean. The finish of the stove is neat and attractive, nickel plating being used to a considerable extent. The cylinders are made of polished brass, having cast-iron bottoms and cast-iron heat collectors at the top. The stove is jappaned in bright colors and ornamented with gold striping. In offering this stove to the trade the company state that they dispense entirely with the use of sheet iron and make all parts in such a way as to insure absolute durability. The company have in preparation a new catalogue showing other improvements in the Monarch line of stoves, which will be ready for distribution to the trade about February 1.



Monarch Vapor Stove.

Enameled Cooking Pot.

Boas Brothers, 80 Beekman street, New York, and Hamburg, Germany, are just bringing out a new cooking utensil, as here illustrated. Near the rim of the pot there are three lugs, designed to keep the cover on when pouring off water, through the opening and holes seen in the cover on the left of the cut. To release the lid it is only necessary to turn it slightly until the opening is under any of the projections, when it may be taken off without difficulty. The pot is designed particularly for vegetables, although almost anything of that nature may be prepared in it. This is made in their mottled gray adamant ware, in 14 sizes ranging from 1½ to 14 quarts. The firm will keep in stock in New York, however, only the following sizes: 2, 2½, 3½, 4½, 5½ and 6½ quarts, although any or all sizes may be imported to order.

Enameled Adamant Cooking Utensil.

The entire article will be made regularly in adamant ware, covers included, no tin covers being supplied with these goods. On importation orders, in sufficient quantities to warrant, these goods will be made in any colors desired, including blue, brown or red; and instead of fixed handles, a bail and ears, or long rigid handle will be furnished. The manufacturers refer to the fact that these goods have a triple coating of enamel and that in baking care is taken not to allow spots to form on the bottom of the ware, thus adding much to its smoothness and finish.

S. E. Dibble and Mr. Curtiss of Curtiss & Pierpont of New Haven, Conn., were in New York on Monday to attend a meeting in which both firms were interested.

L. H. Tourey, Waterbury, Conn., was in the city on Tuesday. He states that he had a good trade in 1892. The object of his visit at this time was to settle up accounts for 1892 with the New York wholesalers.

The firm of Webb, Hinchman & Co. of Tuxedo was dissolved on the 1st inst. The business will be continued by J. B. Hinchman.

T. F. Kelley, for many years in the stove and furnace business in Newark, N. J., has sold out to Dean & Price. Mr. Dean has been in Mr. Kelley's employ for several years, and the new firm will continue the business just as it has been conducted for so long a time by Mr. Kelley.

The city debt of Boston is $30,500,000. During the coming year $4,000,000 can be expended for improvements without adding to the amount.

TRADE REPORT.

The Iron Market.

The condition of the Pig Iron trade throughout the country is naturally quiet at this season of the year, and in view of the low prices prevailing and the uncertainty of future business conditions, there is a disposition on the part of buyers to supply immediate requirements only, keeping in close touch with the market, however, satisfied to await further developments. Eastern foundrymen as a general rule are very indifferent, and sellers complain that it is difficult to make sales. New York quotations are as follows: Northern brands $14.75 @ $15.25 for No. 1; $14 @ $14.50 for No. 2; tidewater. Southern Iron, same delivery, $14.75 @ $15 for No. 1; $13.75 @ $14 for No. 2 and No. 1 Soft; $13.25 @ $13.50 for No. 2 Soft.

The situation at Philadelphia is somewhat more encouraging, as there is a better movement noticable in Pig Iron, though chiefly in small lots. Stocks in consumers' yards were reduced to such small proportions that renewals have been imperative; so that along the entire line there has been more or less activity. Some bids were for large lots, but not on terms that makers could accept, so that the practical result has been small orders at figures showing a compromise on both sides, the ultimate outcome in regard to prices being still undecided. Some good concerns say that it is quite impossible for them, or any one else, to meet the demand at prices now obtainable for large lots, and that for the present they are simply lookers-on; if they can get their price well and good, if not, they are not in the business. These remarks are based on bid prices, not on actual selling prices, the difference being from 25¢ to 50¢ ₱ ton. It is a satisfaction, however, to find that there is a market at a price—pretty good evidence that business is starting up, and that in course of two or three weeks prices will probably become fairly settled. Quotations are about as follows for Philadelphia deliveries:

American Scotch, No. 1x	$17.00 @ $17.25
American Scotch, No. 2x	16.00 @ 16.25

The Pig Iron trade at Pittsburgh is in rather a discouraging condition, as indicated by the fact that it is almost impossible to make sales of Iron even in the face of the very low prices prevailing. Although prices on nearly all kinds of raw and finished material are considerably lower now than they were a month ago, the volume of business continues small, buyers seemingly having no fears that prices will go higher for some time at least. Expectations that business would revive and buying would commence after the holiday season are not being realized, nor does a much better feeling prevail. Buyers continue to confine their purchases to lots for immediate requirements, and as long as this policy is pursued no improvement in prices can reasonably be expected. A peculiar characteristic of the market just now is the fact that, notwithstanding prices are much lower to-day than six months ago, and stocks have very much decreased, there is more disposition among furnacemen to force sales of Iron at this time than at any period within the last six months. If this course is persisted in there will be very little chance of any improvement in prices, but, on the contrary, it may result in values being pushed down still further, although this is not expected. The condition of the market during the past week at this point is reflected by the following quotations:

No. 1 Foundry	$14.00 @ $14.10,	cash.
No. 2 Foundry	12.00 @ 13.10,	"
Charcoal Foundry No. 1	19.00 @ 20.00,	"
Charcoal Foundry No. 2	18.50 @ 19.00,	"

Advices from Chicago indicate that there has been a slight increase in the demand and sales of Pig Iron in the West during the past week over that of the week preceding, although business has been of a moderate character, and for small lots for immediate shipment. Sales of Foundry Iron were made at full figures, and negotiations are now in progress for further lots, representing considerable quantities. Hopes are entertained that the buying movement predicted for January is now beginning, though many buyers who are now making inquiries are apparently in no hurry to contract to any extent for their requirements, but are keeping close watch of the market to be prepared to take advantage of any change which may occur. Quotations, f.o.b. Chicago, are as follows:

Local Coke Foundry, No. 1	13.75 @	14.25
Local Coke Foundry, No. 2	13.50 @	14.00
Local Coke Foundry, No. 3	13.25 @	13.75
Local Scotch	14.50 @	15.00

Southern markets have not seen enough of a revival in the demand for Pig Iron to call for any change in quotations; large buyers are not in the market, but sellers are not disposed to make any material concession as long as there is a decrease in stocks going on from month to month, but at the same time they are free sellers at the current quotations. Taken as a whole the market cannot be said to have changed in any essential particular, and sellers appear to have confidence in the future. Quotations are as follows:

Foundry.

Southern Coke, No. 1	$13.75 @ $14.00
Southern Coke, No. 2	12.50 @ 12.75
Southern Coke, No. 3	12.00 @ 12.25
Ohio Soft Stone Coal, No. 1	16.00 @ 16.50
Ohio Soft Stone Coal, No. 2	15.00 @ 15.50
Mahoning and Shenango Valley	15.75 @ 16.75
Hanging Rock Charcoal, No. 1	19.15 @ 19.50
Hanging Rock Charcoal, No. 2	18.60 @ 19.00
Tennessee and Alabama Charcoal, No. 1	16.50 @ 17.00
Tennessee and Alabama Charcoal, No. 2	15.50 @ 6.00

Sheets.—Demand for Black Sheet Iron is only moderate, and the orders taken represent little profit to manufacturers. In the West dealers are ordering Iron freely, and there are indications that large buyers will generally follow their usual custom of placing orders during February. The demand for Galvanized Iron is a little better than for Black, but the mills have evidently caught up with their orders, as stocks in local warehouses are getting in much better shape than any time since last summer. The demand is confined at present to small lots for quick shipment.

Billets and Rods.—Eastern mills have been able to contract for delivery during the second half of the year. There is nothing doing in Foreign Billets, reexport orders having been covered some time since.

Merchant Bars.—A slight increase in orders since the first of the year is reported, but the volume of business is very much smaller than was expected by manufacturers. It is the impression that orders will come in more freely toward the latter part of this month and during February, for the reason that buyers have not had time as yet to size up their requirements, and will probably not be ready to place their orders for two or three weeks yet.

Steel Rails.—The market is again very quiet so far as the Eastern mills are concerned, the reduction in the price having apparently not stimulated buying. In other sections the mills do not seem to be taking a very heavy business.

Structural Iron and Steel.—Current business is restricted to moderate requirements. There is, however, a good deal of figuring going on and some very large work will come into the market when the season fairly opens.

Metal Market.

Copper.—Nothing new has come to the surface in the market for this metal during the past week. Consumers are still drawing from receipts on old contracts sufficient supply to cover immediate wants, and, having probable requirements for a little time ahead well provided for, purchase in a perfunctory manner at the present time. Shipments to Europe are fair, but new export orders continue to be few in number and chiefly for unimportant quantities. Despite this inaction, however, prices remain quite steady.

Pig Tin.—The record of Metal Exchange dealings shows a total of over 500

tons turned during the past week, including 110 tons prompt delivery, 100 tons ex-steamships then afloat but now in port, and the balance for February delivery. Nearly all the sales ex-ship were on terms involving payment on presentation of shipping documents, and suggested not only a willingness on the part of some importers to turn Tin into cash as quickly as possible, but some desire to prevent accumulation of individual holdings. Current month and February deliveries also declined, despite careful nursing of the market by a few operators, and, upon the whole, the market reflected what would appear to be a natural effect of rather burdensome stocks in the hands of some operators. Still the information is volunteered that supplies on spot and afloat are unusually well distributed among the large handlers of the metal, that consumption in this country is above the January average, if anything, and that, despite the somewhat peculiar character of speculative operations here latterly and the small dealings in London, the market is not as weak as surface appearances would indicate.

Pig Lead.—No change has taken place in the situation here or at the West, the market as a rule being quiet. What the National Lead Company and other "combine" buyers (whose purchases are very difficult to trace) may have done is problematical, but other buyers have purchased very indifferently, and the demand at present is exceedingly slow. Still the offering is comparatively light and reserved at that, while prices are held quite firmly.

Spelter.—The demand in this quarter is without visible improvement. Efforts to draw out bids on round lots a shade below the prices at which sales have been making latterly prove fruitless, and the presumption is that consumers are not taking a great deal of liberty with the facts when they state that near future wants are well provided for. Reports from the West indicate that the production of Spelter will be something over 90,000 tons, which is a heavy increase over 1891. The increase in consumption is not commensurate with this, which fact, of course, tends to depress the market. The outlook cannot be called encouraging.

Financial.

That the currency question is uppermost in the thoughts of financiers appears from the simultaneous action of the New York and Boston Chambers of Commerce, pointing out the increasing difficulty of redeeming the Government obligations in gold so long as the heavy monthly purchases of silver bullion are continued. At Washington the conflict of opinion in both Houses upon the silver question is so sharp that there is little hope of any agreement during the term of the present Congress, so that the purchase of silver bullion under the Sherman act of July 14, 1890, will probably continue until the next Congress can act. Meanwhile the exports of silver bullion are unprecedented owing to commercial conditions. The bulk of the metal eventually finds its way to the Orient in payment for commodities. Of $5,000,000 specie exports from New York since January 1, over one-third is silver.

The stock market was irregular. Pending the action of Congress respecting silver investors stand aloof to await events. Western stocks were affected by a report that the Legislature of Nebraska would take measures still further to oppress railroad corporations in that State, and Reading was freely sold on reports of contemplated adverse legislation; also by the action of the managers in borrowing money with which to pay interest on bonds, giving as security the best collateral in the treasury.

The merchandise markets are generally firm. The Government crop report making the yield of wheat 515,949,000 bushels and corn 1,628,464,000 bushels—the former valued at $322,000,000, the latter $642,000,000—checked the upward course of prices. Western wheat receipts continue large, being 12,000,000 bushels greater since August 1 than a year ago, while exports for the month are about 3,000,000 bushels less. Pork prices in Chicago reached $19.10 a barrel, the highest point for ten years. Whisky was marked up to $1.35 ₱ gallon, the highest for years. Flour is unusually dull. Cotton advanced $\frac{1}{16}$¢. Foreign imports are again larger. Coffee declined. Raw sugar quiet. The dry goods market is strong,

Coal.

Events in the Anthracite Coal trade follow in rapid succession. A week ago reference was made in these columns to the action of President Maxwell of the New Jersey Central Railroad in practically withdrawing from the Reading combine, at the same time taking along the Lehigh & Wilkesbarre Coal Company. This proceeding was commonly supposed to be in anticipation of possible legal proceedings prejudicial to the combine arrangement. The tendency is still toward a return to the conditions previously existing, but so far as the Coal trade is concerned there is no further change in the situation. Prices are maintained and restriction continues as before. Pea and Buckwheat are still scarce and dear, some dealers being out of the market for these sizes. Quotations are: Pea, $2.40 @ $3 15; Buckwheat, $1.85 @ $2.15. In regard to some other sizes large deliveries cannot be promised at once on account of difficulties in transportation. One effect of talk about a coming dissolution of the combine is to check sales, as consumers are keeping aloof to await events.

The total amount of Anthracite Coal sent to market for the week ending December 31 was 502,067 tons, and the total amount of Anthracite mined during 1892 was 41,476,688 tons, compared with 40,416,193 tons for the same period in 1891, an increase of 1,060,495 tons.

The Pennsylvania Railroad brought to market last week 230,000 tons of Coal and the Reading 360,000 tons, of which 28,000 tons were sent to New York.

CONDITION OF THE

Hardware Trade.

It is as yet too early for a general movement of business, but there is a good deal doing by the larger houses in the way of completing their orders for the coming season. Jobbers and manufacturers are giving considerable attention to the preparation of price lists, circulars, &c., and making their arrangements in many ways for a vigorous prosecution of business, the situation being such that there is a general impression that the volume of trade will be large, and the various parties competing for it are desirous of securing their share. Travelers are many of them already on the road, but it is rather early as yet for them to be sending in many orders. It is expected that in a week or ten days there will be a more general activity. Prices continue without material change, the market as a whole not being characterized by much strength. Quotations are, however, on many lines exceedingly close, leaving but narrow margins for the manufacturers, which they are endeavoring to widen by economy and improved methods in making the goods. In some lines revised quotations are announced, as referred to below.

Notes on Prices.

Cut Nails.—The Cut-Nail market continues quiet and in substantially the same condition as for the past few weeks. There is a disposition on the part of manufacturers to move conservatively and by a diminished production to avoid the accumulation of Nails and at the same time to adhere quite rigidly to the prevailing price, refusing to make concessions. For small lots from store in New York the regular quotation is $1.75 to $1.80. Carload lots on dock are held at $1.60 to $1.75, according to average.

Advices from Chicago.—Cut Steel Nails are quiet but firm. Jobbers quote small lots from stock at $1.65 to $1.70, depending on the average.

Wire Nails.—There has been no important change in the Wire Nail market since our last report. There is a good deal of inquiry for Nails from the trade, and the aggregate of business since the opening of the year has been fair.

Advices from Chicago.—Manufacturers report a better inquiry from large buyers than for some weeks and indications point to an active trade in the near future. Sales are being made from stock at prices very close to manufacturers' quotations from factory, but manufacturers claim that this is done for special purposes and not because of the lowering of rates at works. Some go so far as to claim that prices will be higher rather than lower. Carload lots are quoted at $1.60; small lots from stock are quoted $1.65 to $1.70.

Barb Wire.—During the past week the Barb Wire market has been sluggish, with only a limited amount of business, and prices are without material change. Small lots from store in New York are still

quoted at $3 10 for Four-Point Galvanized, carload lots being held at $3.

Advices from Chicago.—While the outlook for spring business is good and manufacturers take a cheerful view of the situation because they have booked a good number of orders, the trade of the immediate week under review has not been large, and further buying may be deferred for a little time until some movement is made in the smaller jobbing and retail trade. Jobbers sell small lots at $2.25, Painted, and $2.70, Galvanized, with 5 cents off for mixed carloads.

Wringers. — The American Wringer Company, 99 Chambers street, New York, in connection with their 1893 catalogue, just issued, announce a new list, in which net prices are given on their line of Wringers, subject only to a discount of 2 per cent. for cash in ten days, the goods delivered f.o.b. factories or at warehouse in New York City.

Auger Mortise Sash Pulleys.—Palmer Hardware Mfg. Company, Troy, N. Y.; Empire Portable Forge Company, Lansingburg, N. Y; Stover Mfg. Company, Freeport, Ill., and Shepard Hardware Company, Buffalo, N. Y., make a joint announcement to the trade to the effect that until further notice quantity orders for Auger Mortise Sash Pulleys may be made up of the following: Common Sense, Empire, Ideal Nos. 2 and 4, Star and Acme.

Planes.—The following advanced prices on Planes were recently adopted by the manufacturers, subject to a discount of 2 per cent. for cash:

	Per cent.
Fancy Planes	40
First Quality Bench Planes	45
Second Quality Bench Planes	50

Tin Plate.—Arrivals of 35,000 boxes or more during the past week have served to replenish jobbers' assortments, and the supply is better at present than it has been for some little time past, since spot business has not only been slow but chiefly of retail character. Prices are a shade easier on some lines of Ternes and very light weight Bessemer Cokes. Contracts for forward delivery have been unimportant, and interest in futures is momentarily tame. Importers are ordering largely for immediate requirements, and those handling American Tin are pursuing an equally conservative policy. It is too early in the season to predict the extent of demand for either Bright or Terne Plates.

Cordage.—Within the past week or two there has been a further shrinkage in the price of Manila Rope and also in Sisal, New Zealand, however, remaining substantially without change. The market is somewhat irregular in tone, owing to the active competition between the National Cordage Company and the outside manufacturers. The National Cordage Company in order to carry out their plans for controlling the market are negotiating with John Good and the Travers Bros. Company for the purchase of their Cordage plants, and are, it is understood, offering them large inducements. Thus far, however, nothing has been consummated. The company are also endeavoring to control the Hemp market, to further their plans in regard to a control of the manufacured product.

Mica.—Eugene Munsell & Co., miners and wholesale dealers in Mica, 218 Water street, New York, have issued a revised price-list which represents some additional sizes and some slight changes in price.

Tinners' Tools.—Peck, Stow & Wilcox Company, 27 Chambers street, New York, and Southington, Conn., have issued a revised discount sheet relating to their 1890 catalogue. It gives prices on their large and varied line of General Hardware and also on their Tinners' Tools and Machines and Tinners' Hardware. We print below their revised prices on Tinners' Tools and Tinners' Hardware. Special goods, marked A, are subject only to a cash discount of 2 per cent. beyond the prices printed. Other goods, not marked A, are subject to an additional discount of 25 per cent. on large orders.

Leader Pipe.—Bruce & Cook, 190 Water street, New York, inform us that as New York agents for W. Austin Obdyke & Co.'s corrugated leader pipe, they have made no change in the price of the latter and their list remains as heretofore, which is 12 cents per foot for 2 inch and 15 cents per foot for 3-inch, for both round and square, subject to the usual discount.

Glass.—Reports from Pittsburgh indicate that the cold weather of the past week or more has not affected the orders for Glass to any great extent, as the demand remains steady. Since December 1, 1892, the number of pots in operation at American Glass factories has increased, owing to the completion of plants then in course of erection. The number of pots, or their equivalent in tanks, as given by a Pittsburgh paper devoted to the Glass interests, that are now in operation is 1715. There are 410 pots out of operation and 188 in course of erection. Prices of American and imported Glass are unchanged, though local demand is limited. It is understood that three New York firms who handle Plate Glass in connection with their Sheet Glass business have consolidated this branch of their business, and thus expect to reduce expenses in handling Plate Glass. The new concern will be known as the Manhattan Plate Glass Company, with offices at 49-53 Lafayette place, and expect to be in working order by February 1. Quotations on Glass are as follows: American Window Glass, 1000-box lots or more, 80 and 15 per cent. discount; carloads, 80 and 10 per cent. discount; less than carloads, 80 and 5 per cent. discount. French Window Glass, 75 and 10 and 5 per cent. discount.

American Plate ranges in price from 50 and 10 and 7½ per cent. discount to 60 and 2½ per cent. discount. Imported Plate Glass, 60 per cent. discount to 60 and 10 and 5 per cent. discount.

Chicago Report.

Scrap.—Old material has been so dull of late that dealers hardly know what policy to pursue. Quite a number of merchants in distant localities have written here to learn whether their accumulations of Scrap could be disposed of in this market, but discouraging replies were given. Dealers continue their old schedule of buying prices, but, of course, these are only nominal under the circumstances.

	Per net ton.	Per lb

Trade Notes.

THE AMERICAN WRINGER COMPANY, 99 Chambers street, have issued a new catalogue and price list of 56 pages, containing the goods manufactured by them, including Clothes Wringers and household and Hardware specialities. Among the goods recently added to the line of Wringers are the Handy, Magic, Rival, Relief and Superior with pressure screws The latter is new to the domestic trade, although having been exported by them. There are a number of Folding Wash Benches. A new one known as the Household is referred to by the company as capable of holding two Tubs and a Clothes Wringer. Any Wringer can be placed on the Standard, thus leaving the Tubs entirely free to be handled, obviating the necessity of constantly changing the Wringer from one Tub to the other. It is so constructed that when not in use it can be folded up with the Wringer attached and put away in a small space. There is also a number of articles in addition to the Wringers, such as Washing Machines, Clothes Washers, Mop Wringers, Mangles, Clothes Horse, Clothes Drying Bars, Lawn Swing, Mouse and Rat Traps, Step and Extension Ladders, Lemon Squeezers and Cork Pullers. Attention is called by the company to the fact that the large plant for the manufacture of Rubber Rolls, having a capacity of 6000 rolls per day, that has been in course of erection during the past year, is now completed, and they are now making their own rolls.

THE NORTHWESTERN TRAVELING MEN'S ASSOCIATION met in annual session at the Palmer House, Chicago, on December 28, 1892. President George J. Reed occupied the chair. After the address of the president the report of the secretary was read. It showed a disbursement of $1,810,850 to beneficiaries since the foundation of the organization, while during the year just closed the sum of $175,000 had been paid out in benefits to the relatives of deceased members. After the election of officers, in which the old officers were re-elected, President Reed received a surprise in the shape of a money present of $500 as a mark of appreciation of his services.

WALDO G. BROWN, Houlton, Me., has disposed of his Hardware store, closing out his Light Shelf and Builders' Hardware, and removing his heavy Hardware, Bar Iron, Saws, Belting, Mill Supplies, Pumps, Wrought-Iron Pipe, Steam Fittings, &c., to warerooms at the Houlton foundry and machine shops, where his office will hereafter be located. Mr. Brown will continue his already established machine shop business, and also the manufacturing of Rotary Saw Mills, Shingle Machines, Gang Lath Machines, Wood-sawing Machines, Land Rollers, Spring-tooth Harrows, Horse Hoes, Cultivators, Plows, Stoves, Mill, Implement and Machinery Castings, and will continue to carry in stock Heavy Hardware, Bar Iron, Steel, Belting, &c. Mr. Brown advises us that the largest plant of the kind in Eastern Maine, newly equipped with the latest improved machines for both wood and iron working, is nearing completion, and that orders for the season of 1893 are coming in with a gratifying outlook for a good year's business.

THE HABERMAN MFG. COMPANY and their auctioneer, Julius E. Mosheim, through their attorneys, recently made a strong effort before Judge Coxe in the United States Circuit Court for the Southern District of New York to have him suspend the injunction granted the Lalance & Grosjean Mfg. Company restraining the Haberman Mfg. Company, their agents, &c., from dealing directly or indirectly in Enameled Wares infringing on the Kegreiz patent. The ground taken by the judge was that the complainants were the owners of a valid patent, and the motion was denied, the court ordering a permanent injunction to issue.

BURN STAMPING & MFG. COMPANY, 66 State street, Chicago, issue a catalogue relating to dairy supplies and other specialties. Their aim is to supply everything in the line of milk cans and articles used in the dairy. Illustrations are given in their catalogue of a variety of patterns of steel-clad milk cans, dairy pails, dippers, measures, strainers, ash cans, oily waste cans, &c. Their factory, just completed, at Chicago Ridge, 103d street, is 50 x 200 feet, four stories high. The tinning and galvanizing houses are separate from the main building. They have their own gas plant and use fuel oil. The Messrs. Burn of the firm were, up to a few months since, connected with the Buhl Stamping Company, Detroit.

IT IS ANNOUNCED that the firm of Kegler, Weinschenk & Ahlers, Bellevue, Iowa, have been dissolved by mutual consent. Messrs. Kegler and Weinschenk will hereafter conduct the Agricultural Implement business, while Messrs. Kegler, Weinschenk and Ahlers, under the style of the Bellevue Pump Company, will continue the business of manufacturing Kegler's Patent Chain Pump Curb and Tubing. The Bellevue Pump Company advise us that they are moving into new quarters and enlarging their manufacturing facilities, so as to be in a position to meet the increased demand for their goods.

THE TEA TRAY COMPANY, Newark, N. J., established a quarter of a century ago and incorporated in May, 1892, manufacture at their plant, 156 and 158 Summit street, a full line of Hotel, Children's and Tea Trays, also Japanned Ware, Shades for electrical purposes, Metal specialties, &c., Hoods and Reflectors, Horns, Typewriting Covers, and other articles of any shape or size are made to order from drawings. The various processes in the manufacture of perfect Trays have each its fully equipped department in the factory. The company have their own tool shop, where they make their own Dies, some of which weigh over half a ton. The details of the large establishment are under the personal supervision of either the president or treasurer, thus insuring goods of uniform standard and promptness in executing orders.

UNDER DATE of January 9, Lalance & Grosjean Mfg. Company advise the trade that they have acquired all patents relating

to the manufacture of the ware known as Onyx, including the process of making Onyx Ware, and the trade-mark Onyx as applied to such goods.

Scovill Mfg. Company, 210 Lake street, Chicago, issue a catalogue of Aluminum fancy goods. This is a 12-page pamphlet, in a neat cover, devoted to illustrations of fancy goods which the company are now manufacturing of Aluminum. They comprise Vases for holding Toothpicks, Matches, &c., Napkin Rings, Bon-bon Boxes, Drinking Cups, Envelope Openers, Panels for holding Thermometers, Photograph Frames, Mirror Frames, Smokers' Sets, Card Trays, &c. The workmanship on these fancy articles is of the highest order of artistic merit, and demonstrates the capabilities of Aluminum for ornamental treatment, rivaling the precious metals in appearance and superb finish.

The Griswold Mfg. Company, with office and works on West Tenth street, Erie, Pa., have issued a catalogue and price list of Erie Hollow Ware and Stove Furniture. It is a neat little volume of 84 pages, of a size convenient to carry in the pocket. It is printed in tinted ink, upon good paper and bound in stiff covers. Its pages show a long line of Stove Hollow Ware, together with Waffle Irons, Gem Pans, Dampers, Stove Lifters, Scrapers, Shovels, Stove Pipe Shelves, Fire Sets, Coffee Pot Stands, Sad Iron Stands, Copying Presses, Tobacco Cutters, Umbrella Stands, &c.

The Joseph F. Kernan Company, 59 Wabash avenue, Chicago, report that the Kernan Smoke Consuming Furnace for soft coal is giving universal satisfaction where used.

The new pipe plant which Curtis & Co. have begun to erect at Cohoes, N. Y., to take the place of the one recently burned, will be a modern establishment in every respect and a great improvement over the old shop. The works will be lighted by electricity generated on the premises.

The Pittsburgh Reduction Company, Pittsburgh, Pa., manufacturers of pure aluminum, with works at New Kensington, Pa., have recently made some extensive additions to their plant which will materially increase their capacity for the production of aluminum. For some time past they have found it very difficult to keep up with orders, and as the demand for aluminum is constantly increasing, it became absolutely necessary to increase their facilities for production.

The Baxter Stove Company, Mansfield, Ohio, make a prominent announcement this week of the Monarch Stove of their manufacture. A general view of the Stove is shown in the advertisement, and a list of agencies of the Baxter Stove Company is printed in connection with it.

J. F. Barber & Co., Hazleton, Pa., send us a copy of a circular illustrating the Excelsior Baking and Roasting Pan manufactured by them. It is claimed that this Pan combines all the advantages of other pans, is easily handled and cleaned, as well as being very durable. Wire shoes on the bottom prevents burning of contents, and an improved catch has lately been added to the utensil. The Pans are made from polished steel.

The firm of Lyon, Conklin & Co., Baltimore, Md., Tin-Plate and Sheet-Metal merchants, were reorganized on December 31, 1892. The following are the present members of the firm: William L. Lyon, Oliver P. Lyon, Thos. W. Crook, and Cardiff T. Lyon, general partners; and Daniel E. Conklin, special partner.

A notice is issued to the trade under date of December 31 that the copartnership existing under the firm name of Exeter Brass Works, Eben Folsom & Co., proprietors, Exeter, N. H., was dissolved by mutual consent, the Exeter Brass Works, a corporation organized under the laws of New Hampshire, succeeding to the property and business.

The announcement of the Grand Rapids Refrigerator Company, Grand Rapids, Mich., in our advertising columns this week directs attention to the Leonard Cleanable Refrigerator in new designs for 1893. The chief features of these goods are commented upon and their advantages pointed out. A long list of agencies is presented for the information of buyers.

A notice is issued from Liverpool under date of December 31 that the partnership existing between Henry Nash and Elisha Smith under the name of Henry Nash & Co., Tin Plate and Metal merchants, 12 and 14 Tower Building, North Water street, Liverpool, has been dissolved, Elisha Smith retiring from the firm. Under the same date Henry Nash announces that he will carry on the business under the name of Henry Nash & Co.

Letter from a Tin Plate Maker.

We are in receipt of an interesting letter from James B. Scott & Co., Pittsburgh, from which we quote as follows:

In entering the new year we beg to congratulate you on the enterprise shown in the change of form of this very popular publication. The new form certainly will be very popular and be of advantage to both the readers and the advertisers.

In entering the new year we naturally are all inclined toward a retrospect of the one that is past. In the metal trade certainly there have been many interesting features in the year 1892, and the tin-plate business certainly for a year or more has been unusually influenced owing to the peculiar condition of affairs, resulting from the political situation and the influences which have been at work because of tariff matters. Following the higher duties, the entire trade from largest importers to smallest consumers has felt the influence occasioned by the passage of the McKinley tariff, increasing the duty on tin and terne plates.

As regards our own business, where formerly it was customary to look abroad for our entire source of supplies, to day we are in the position of still doing some importation business, but in addition have the new features, both of being manufacturers ourselves and also buyers from other American manufacturers.

Located as we are individually in this center of the American iron industry, we naturally are greatly influenced by the tendency toward the manufacture of tin and terne plates in this country.

Somewhat over a year ago, we ourselves commenced the manufacture of our Scott's Extra Coated high grade guaranteed roofing plate, which for many years we imported from Wales. The Welsh manufacturer who formerly made the Scott's Extra Coated for us some time ago entirely withdrew from the manufacture of plates, and accordingly, since we ourselves began the manufacture of the Scott's Extra Coated, we have depended entirely upon our own output for supplies of this favorite brand.

During the past year we have also purchased large quantities of American plates from others who are manufacturers of medium grades. It has been gratifying to know that the plates thus purchased have given very general satisfaction in their respective qualities.

As we are entering the new year we are confronted by the change in political outlook following the last election. Irrespective of any desires that we may have personally, we feel that all those in the metal trade cannot help but regret the influences that political matters are now having upon the tin-plate business. We only hope that before long we may be able to consider that, as regards tin plates, the political situation has been settled definitely one way or the other in order that all concerned may be able to adopt a policy as regards this business, feeling that it will not, for a considerable time at least, be again disturbed by outside influences.

The Sheet Manufacturers.

On Tuesday, the 10th inst., the regular monthly meeting, which was also the annual meeting, of the Iron and Steel Sheet Manufacturers' Association, was held at their headquarters in the *Times* Building, Pittsburgh. The attendance was very large, 21 members being present. Officers were elected as follows: J. G. Battelle of the Piqua Rolling Company, Piqua, Ohio, was re-elected president; W. T. Graham of the Standard Iron Company, Bridgeport, Ohio, was elected vice-president, and John Jarrett was re-elected secretary and treasurer. During this week H. M. Garland, president of the Amalgamated Association of Iron and Steel Workers, and John Jarrett, representing the Iron and Steel Sheet Manufacturers' Association, will be in Washington to appear before the House Committee on Coinage, Weights and Measures to urge the adoption of a standard gauge for uniformly measuring the weight and thickness of steel, iron and sheet steel.

Calendars.

Tucker & Dorsey Mfg. Company, Indianapolis, Ind., send a view of the cataract at Spencer, Ind., below which are enumerated the goods manufactured by them. Attached to the card are calendar sheets for 1893. The goods are the company's well-known line of Alarm Tills, Stove Trucks, Kraut Cutters, Step Ladders, Saw Bucks, Towel Rollers, Lemon Squeezers, Furniture Casters, &c.

The Nubian Iron Enamel Company, Cragin, Ill., send a calendar of their first quarter of 1893's stock of Squibs on Black Art. They do not claim the Squibs to be a collection of literary gems, but state that they are willing to sink their naturally poetic, literary and æsthetic temperament in the cause of Nubian, if by their imitation of wit and wisdom they can impress consumers with the good qualities of their Nubian Iron Enamels.

Waterbury Brass Company, 296 Broadway, New York, and Waterbury, have calendar sheets for 1893 attached to a handsome picture of Sunset at Capri. Underneath the picture is a list of goods manufactured by the company. The date sheets are attached by colored cords and the figures are large and distinct.

The *New York Trade School Journal* is the name of a paper issued by the Printing Class of '93 of that institution. It is a four-page paper, measuring 11½ x 16 inches in size, and is an extremely creditable specimen of printing work. The matter with which it is filled will be of interest to the Trade School graduates and all who concern themselves with the work of that excellent institution. There are also several interesting articles on educational matters that will repay the attention of the general reader. The first page of the paper gives experiences of graduates, showing how they have succeeded in business.

Electric Motors and Battery Outfits.

Electro Novelty Company, 9 Knapp street, Boston, are introducing these motors, as shown in Figs 1 and 2. The 2 mouse power motor and battery outfit, Fig. 1, has a base consisting of a cast-

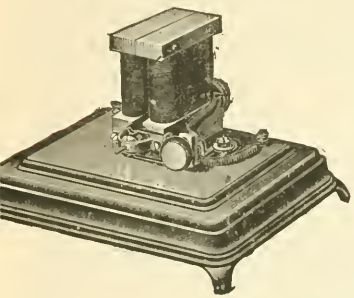

Fig. 1.—Novelty Electric Motor

iron frame in which rests the battery tray. The tray contains two compartments, making two cells in series, the connections being made by copper springs underneath the motor base.

In the bottom of the battery tray are placed a piece of sheet copper and piece of sheet zinc, and between the two is placed a patented battery pad. To each copper is riveted a small copper stud, and when the pad is moistened with a little water and the cover of motor is replaced the motor is ready for operation.

Each charge will, it is stated, run the motor from two to six hours at about 1500

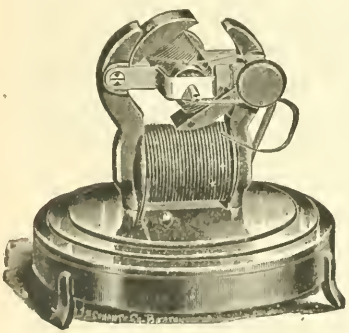

Fig. 2.—The E. A. C. Electric Motor.

revolutions per minute, and the battery can easily be replenished at any time by using new pads.

The motor is represented as a working model of the Edison dynamo, and is especially adapted for running small mechanical toys, fans, &c. Accompanying it is a 24 page book, in which the workings of both motor and battery are fully explained, together with detailed drawings of the same.

The E. A. C. electric motor and battery outfit, Fig. 2, is similar in operation to the motor shown in Fig. 1, and is run by a pad, composed of an envelope of absorbent material, made circular in form, which incloses the exciting material. The simplicity of this pad, together with its harmlessness, constitutes its chief value, as all that is necessary to set the motor in operation is to moisten the pad with water.

The point is made that with these motors there is no poisonous dust which can arise from chemicals to irritate the eyes and poison the lungs, no acids to stain the fingers and ruin the carpet, no fire to burn the children or set fire to the house, and no possibility of a steam boiler explosion, such as may take place in the use of steam toys; all of these dangers are obviated by the use of the battery pad.

The Fletcher Fire Mat.

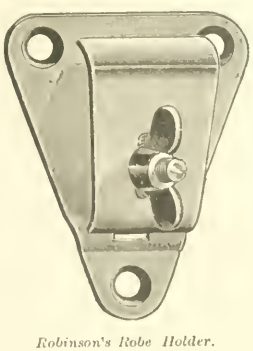
The Fletcher Fire Mat Company, Cincinnati, Ohio, are putting on the market what they call their fire mat, an illustration of which is shown herewith. The mat is made of indestructible material and bound in metal and is said to be serviceable in many ways about a kitchen. It is recommended for use on a stove to prevent the burning of foods while cooking, as by putting the mat under the utensil the heat is tempered. It also prevents tea and coffee from boiling over. The mat can be used on a grate fire, gas, gasoline, oil, coke, coal or coal range. For use in the

The Fletcher Fire Mat.

laundry it is noted that it prevents the irons from being soiled by coming in contact with the flame. Also that the irons retain their heat for a greater length of time when these mats are used for a stand. If the mat become dirty it is cleaned by putting in the flame.

Robinson's Robe Holder.

C. W. Crary & Son, 90 and 92 Illinois street, Chicago, are manufacturing for the inventor the Robe Holder as herewith illustrated. It is intended to be attached



Robinson's Robe Holder.

by screws to any vehicle by means of the clamp, for the purpose of holding the lap robe. Thus the robe is prevented from sagging, flapping against the wheels, or requiring readjusting when getting out of buggies or cutters. By attaching them to a child's crib the quilt or bed clothes may be held in place. The holder may also be used for holding towels, curtains, &c.

Havoc Caused by Zero Weather.

With the advent of zero weather whole communities at once become inspectors of water pipes and plumbing work generally. And this from sheer necessity. It was the exception, rather than the rule, during the recent cold snap, when a housekeeper, rising from his slumbers, found that the whole lead-pipe system for distributing water through the dwelling was not frozen solid. All ordinary preventives had failed of their purpose. This was more particularly true of rural neighborhoods where frame houses prevail, the space between the weather boarding and the inside lath and plaster, which, theoretically, is so conducive to healthful conditions, having suddenly become a chamber for the circulation of frigid currents of air. Consequently all water pipes contiguous to the walls were quickly congealed, despite the extra fires built in furnace and stove. The effects of such a situation in early morning are truly exasperating. Even the most amiable are tempted to denounce the stupidity or neglect everywhere apparent at such a time in bursted pipes and dripping ceilings. The damage often occasioned must be endured with heroism, and perhaps the less said about it the better. We have in mind a handsome dwelling that had been frescoed and otherwise made attractive while the owner was absent in the South. All the precautions against freezing had been taken except turning the water off from the pipes. The watchman in charge awoke only to find that a pipe had burst and that water was streaming through every floor. How effectually to protect lead water pipes from frost following all their ramifications through a building is a puzzle A dictate of prudence is to keep all plumbing work as remote as possible from the outside walls. Another device is to protect all exposed parts by a covering of some non conductor of heat. Now is the time to inquire into these matters and to gather in all the wisdom possible from the suggestions volunteered in such profusion, perhaps when the consequences of neglect are visible, not only in the damage inflicted, but in the size of the bill presented for payment. The wisdom to be gained is lying around literally in chunks—chunks of ice.

A School for Sanitary Plumbing.

In class 287 in the exhibits that will be made at the Columbian Exposition at Chicago under the direction of the Bureau of Hygeine and Sanitation will be found one of the best schools for sanitary plumbing ever organized in this country, perhaps ever organized in the world. But this display, that will represent the most advanced state of the art in all its branches, and also the kindred arts of warming and ventilating buildings, will be of little avail to him who merely takes it in as part of a great show to be looked at as a whole and admired as one admires a show window in a modern city store, merely on account of its artistic arrangement and the number, variety and finish of the articles exposed to view. He who expects to see it, together with the rest of the exhibition, devoting perhaps a week or fortnight to "doing" the whole affair, will bring away with him very little of the valuable knowledge that might be gained by devoting the entire time named to a critical examination of what will be shown in this class. And if only from two to three weeks can be made available it is good counsel to every plumber and steam fitter to advise that all but four or five days of the time be devoted to making sketches and notes of systems and appliances directly connected with his calling. One should not be diffident in asking questions. People will be employed to make explanations and answer inquiries, and the intelligent plumber, steam or hot water fitter seeking knowledge should not be content with the statement that this or that does something claimed for it without knowing just how and why it does it. Assertions, unless their truth is self-evident, should be heard with the spirit of skepticism, which is the true scientific attitude toward every proposition until it be proved accurate, at least in theory. That which is theoretically false should never be accepted as practically true unless actual practice prove the theory to be wrong—a thing that has not infrequently happened. The risk is that in the coming exhibition many will accept statements without proof and will attempt to imitate methods without an adequate understanding of the principles on which they are based, and thus come to grief. Many a beginner has had such experience in attempts at imitating methods of plumbing, heating and ventilation, simply because the attempts were made without the guidance of principles necessary to meet varying conditions. He who visits and studies class 287 as a matter of business and not for play may carry away with him increased skill and knowledge that he could not acquire by years of practice in his trade at home.

Cheapness Not Economy.

Prices of American tin plates average rather higher than those of the imported material. The quality of the former is, however, said to be generally better, grade for grade, than that of the foreign article, especially of such as has been received lately. Consumers have not, however, recognized this fact to any extent. They do not care to pay even 20 to 25 cents more for a box of native-made plates than they are asked for one of (nominally) similar quality made abroad. When, however, an exceptionally fine grade of roofing plates is required for some special purpose, price being of no great object, it is frequently found that the home-made material is selected. And the same has been noted in the case of bright plates when desired for specially fine work in stamping or otherwise. Then the higher priced American sheets are preferred, because of their intrinsic value. A case in point was recently brought to our notice. A large concern in this city, who are manufacturing fancy goods, have for years been using the best Welsh bright plates for making rims and clasps of cheap bag purses and pouches, a fitting which necessitates very accurate bending and close folding of the metal. The firm have for a long time tried various brands of imported plates for this purpose with most unsatisfactory results. From eight to nine tenths of the material used is stated to have been absolutely wasted through splitting of the tin during the process of folding. American plates, at a slightly higher cost, have recently been tried by them, with the result that, of 50 boxes used, not one sheet was wasted. All the material stood the test, and a large saving will be thus effected in this particular branch of manufacture. This is a practical indorsement of the value of American bright plates which is very gratifying.

The Revival of Kansas City.

As the general prosperity of a nation is so vitally dependent upon the individual well-being of its component parts—that is, of the various cities and communities which go to make up its entire body politic—we must greet with special satisfaction every evidence of progress in the cities of our own country. Few reports have been more cheering in this respect than those which come from Kansas City. As is well known, the collapse of "boom" speculations in that city a few years ago left it stranded upon shoals of financial difficulty. As an article which appeared in the *Kansas City Star* of December 22 put the situation: "For a time it seemed as though

bed-rock in the downward course would never be reached. But it has been reached at last, and in the 12 months of the present year progress on the upward scale has been rapid and pronounced."

The returning tide of prosperity appears to have set in in full flood, and the revival which the past year has witnessed appears to be one based on really solid and stable grounds, giving promise of an era of steady growth and of permanent weal for Kansas City.

From the article above mentioned, as well as from reliable correspondents in the city, we learn that the increase of population in 1892 amounted to 15,000. The receipts of the cable lines have increased as much as 40 per cent., while the holiday trade is reported as unusually heavy, merchants in all branches of business having been taxed to the utmost to supply the demands of their customers. Much Eastern capital is being invested in local enterprises, and securities are stable, houses long tenantless are filling up quickly and agents report the supply of good residences at reasonable rents to be unequal to the demand. Manufacturers in many lines report having given employment to double the number of hands that were on their pay roll during the previous year; while the increased enrollment of pupils in the public schools (a very reliable test of progress) reaches the large figure of 1500 over 1889, the largest ever hitherto recorded. It is stated, too, that the additional scholars are children of new families in the city and not those who have been born there. These facts speak for themselves, and we are glad to be able to chronicle so pleasant a change.

Street Railway Postal-Car Service in St. Louis.

In an appendix to the annual report of the Postmaster-General for the fiscal year ending June 30, 1892, Postmaster John B. Harlow of St. Louis, Mo., describes his application of the railway post office principle to street cars in that city; an innovation which appears to promise very satisfactory results in expediting the delivery and collection of mail. Mr. Harlow considers the new system destined to revolutionize the present methods of collections from street letter boxes, as well as the dispatch of city mail on the line of the road to carriers for delivery. The car used in St. Louis is described as follows: "The car is a miniature railway postal car, 20 feet long and the regulation width of a street car. It is run under the electric system with its own motor on front and rear platform, with motorneer and conductor; sliding doors at each end and wide sliding doors with four windows on each side of car, with slot for mailing letters on each side bearing appropriate signs. The interior is well lighted with electric lights; the furniture, consisting of stove, letter case amply large enough for all distributing, a rack for sixteen sacks, a stamping table, and all the conveniences of a modern railway postal car. Its run is from Sixth and Locust streets westward to the city limits — about six miles — the schedule time being 40 minutes." There are three sub-stations on this route, each with a number of carriers attached, the mail for whom is made up at the main office, leaving the clerk in charge of car free to handle and distribute mail received on the route. It is calculated that by the twelve carriers reporting at the sub-stations instead of at the main office an aggregate saving of time is made to the extent of 10 hours daily. More sub-stations are to be placed on the line of the road with a number of accumulation street letter boxes at intervals, where carriers will deposit their collections. These boxes will be picked up by the car as it passes going either east or west. It would seem that this system might be very advantageously adopted in other cities in place of the far from speedy method of postal delivery and collection which at present obtains. The report does not state whether any steps have been taken to apply the St. Louis method to other districts.

Defective Flues.

About this season of the year when "the cold begins to strengthen" it is usual to hear of tragical scenes at some of our country residences caused by the sudden breaking out of fires at untimely hours and in the most unexpected places. In most cases little more is attempted than to tumble out the furniture and to shelter the family with the nearest neighbors. Scarcely one of our readers can fail to call to mind one or more distressing occurrences of this sort occurring not long ago. We might mention a town near New York where, on an average—and the population is not numerous, either—at least one good house has burned up every winter for several years past. The circumstance to be especially noted is that in so many instances the fire has first been noticed breaking out somewhere near the chimney and most likely in the roof itself. While it may rarely be possible to say precisely how the wood ignited, all traces of the fact being obliterated in the general ruin, the affirmation may safely be made that very frequently the trouble arises from the disintegration of the mortar in the chimneys from alternate freezing and thawing, until finally a crevice is opened from which a tongue protrudes, licking up the shingle first and then the entire structure. Anybody who takes the trouble in the autumn to prance over the roof of his dwelling, in search of possible defects of the character described, of course meanwhile grabbing at lightning rods, dormer windows or other projections for personal safety, is almost sure to detect imperfections in the masonry which need an application of cement or something of the kind to make everything secure. This annual inspection should not be neglected, otherwise a newspaper paragraph may appear chronicling "a disastrous fire," and ending with the trite observation: "Cause, a defective flue." Or, better still, run up an earthenware pipe inside of the brickwork, and so get a smooth flue and the fewest possible joints.

Asbestos.

A feature of the trade in asbestos is that the demand for it is constantly increasing. Its fire-resisting quality has not only brought it into extensive use in the heating trade, but it has found many other important applications. It is hardly worth while to dwell on these applications, since the catalogues of dealers in the material afford all needful information on this point. The increase in the trade is very notable. Some comprehensive as well as authentic information upon this subject has been made accessible to the public through a recent interesting and instructive paper read before the Mining Association of Quebec by L. A. Klein, who is thoroughly conversant with the details of asbestos mining as it is now extensively carried on in the Province of Quebec, Canada. In 1880 the output of these mines was 380 tons. In 1890, 8860 tons were mined, or more than 23 times the output at the beginning of the decade. A large quantity of this product finds a market in the United States. In the year 1890 the importation was a little over 2000 tons. Yet while the output has grown so much and is likely to become greater, the price has increased with marked fluctuations, up and down, till in 1890 it reached an average of $127 per ton. In 1880 it averaged $65 per ton. The increase of demand that could thus constantly advance the price in the face of so large an increase of output is strikingly shown in this brief statement.

Why Asbestos is High Priced.

Most people are wont to consider fibrous asbestos as simply a crude mineral, requiring very little preparation to fit it for the market, and are apt to suppose that its high price results from control of the market by those engaged in mining it. While the fluctuations in price give some ground for such a view, the fact remains that the mining of the material and its separation into grades for market involve a great deal of expense for labor. In some cases 150 tons of rock have to be blasted out to obtain a single ton of asbestos. Mr. Klein, in the paper above referred to, estimates that, on the average, 100 tons of rock are excavated in the Canada mines to get 1 ton of the fibrous asbestos. After blasting a considerable portion of the rock has to be broken with sledges or by machinery, in order to completely separate the fiber which occurs in the small veins. Stone crushers are now employed for breaking up the rock finer than it can be broken by the blasting; but their use has the disadvantage that the fiber is more or less injured by the action of these machines. The grading is mostly done by hand, but machinery for this purpose has been introduced in some of the mines. It is inevitable that the labor involved in these operations will continue to make asbestos a rather costly material, even if speculation should cease to affect its price in any material degree.

Spring floods threaten to be more than usually destructive.

WORLD'S FAIR NOTES.

A Government Standard Measure of Length.

T. C. Mendenhall, Superintendent of Weights and Measures, United States Coast and Geodetic Survey, has arranged for an interesting exhibit from a scientific point of view. Desiring to secure a standard measure of length, he has ordered from the Illinois Steel Company a bar of steel 50½ feet long, 2 inches wide and ½ inch thick. This will form a so-called bench standard, which will be particularly useful for the comparison of steel tapes used by engineers. It was desirable to have this standard in a single bar, instead of two or more pieces, so that the execution of the order will be a nice piece of work. It will be rolled at the Milwaukee Works of the Illinois Steel Company and will afterward be planed smooth on all sides by the E. P. Allis Company. It will be placed in the Government Building on the exposition grounds.

What Exhibitors Will Have to Pay.

The rates that will be charged exhibitors for light, water and all kinds of power were practically fixed last week at a special meeting of the exposition directors.

It is now possible for exhibitors to estimate the exact cost of making their displays—a thing they have not been able to do until the rules were published. Loud calls have lately been made for these rules, and because they were not issued many firms that intended to make displays withdrew from the fair. The opinion obtained to an extent that the directors of the fair were holding back the prices they intended to charge with the idea of collecting exorbitant rates after exhibits were located in the buildings. This impression was wholly erroneous. The delay in issuing the scale of prices was due to a difference of opinion between Director-General Davis and Chief Burnham as to which should execute the rules. So far as the rates to be charged are concerned, the prices might just as well have been announced two months ago, for the scale adopted by the National Board last October is practically unchanged. A few concessions in the way of prices were made, but in the main the rates remain the same.

An important section of the rules and one in which nearly every exhibitor at the fair will be interested is that setting forth the course to be pursued in getting different kinds of power, gas, light or water. This section reads as follows:

Exhibitors desiring to contract for service of electricity, steam, compressed air, power from shafting, gas or water, must make application to the chiefs of the departments in which their exhibits are installed. No application will be entertained unless made upon a blank furnished by the chief of department; and when an application has been approved by the Director-General a contract will be executed on the part of the World's Columbian Exposition by the Director of Works, if practicable, on the terms set forth in the rules. In no case will service be furnished except under authority of contract in writing, the payments for which shall be made by the applicant to the World's Columbian Exposition at the time of the execution of said contract.

In all cases the supply of power, &c., will begin May 1 and end October 30. It is agreed that a limited quantity will be furnished free. For instance, a certain number of electric lamps will be hung in all the buildings. These are supposed to illuminate the aisles and exhibit spaces. If any exhibitor wants his section more brilliantly illuminated, he can get all the lights he wants by paying for them. The same principle applies to power to operate machinery. The Exposition Company will furnish free of charge enough power to start an unloaded machine. If the exhibitor wants to put the machine to the test of turning out a certain product—in other words, loading it—he must buy the additional power.

The rate for each incandescent electric lamp of 16-candle power for the period of the exposition is $8. The Westinghouse system is used, and wiring, which is done at the expense of the customers, will be under the direction of Mr. Burnham's men. State buildings and national headquarters are to be wired by their own boards on plans approved by the Director of Works.

The charge for connecting motors with the main supply line varies from $10 to $15, according to the power used. The rates for electric power, after connections have been made, are as follows per horse-power:

For ¼ horse-power and less	$20
For more than ¼ horse-power and not exceeding ½ horse-power	40
For more than ½ horse-power and not exceeding 1	75
For more than 1 horse-power and not exceeding 2	70
For more than 2 horse power and not exceeding 3	60
For more than 3 horse-power	50

The charge for electric lamps of 2000 candle-power is $60. The rate for steam power is $40 per horse-power. The rate contemplates continuous service, or power that can be demanded at any time at the option of the consumer. Those requiring power for a few hours only each day will be charged at the rate of 4 cents per horse power per hour. The hours that this extra power will be furnished are to be determined by the chiefs of departments.

Compressed air is more expensive, the rate for that being $60 per horse-power for the period of the exposition and 5 cents per hour per horse-power when used at irregular intervals. Power from shafting is listed at $60 per horse-power. The following rates for electric power in electricity building were agreed to:

For one-quarter horse-power and less	$15.00
More than one-quarter horse-power and not exceeding one-half horse-power	30.00
More than one-half horse-power and not exceeding one	50.00
More than one horse-power, not exceeding two, per horse-power	45.00
More than two horse-power and not exceeding three, per horse-power	42.50
More than three horse-power, per horse-power	40.00

An important provision of the rules relating to all kinds of power is that exhibitors who want to operate their machines but one or two hours a day can do so without paying for power all the time. This was different in the old rules and many complaints were made in consequence. Under the new order of things, department chiefs fix several hours each day when exhibitors who want to operate their machines can do so. The rate charged for this service is about 4 cents an hour per horse-power.

Assignments of Space.

Chief Allison of the Department of Manufactures being too ill to continue the allotment of space in his building, Director-General Davis assumed charge of the office on the 9th and decided to close up the business within the next few days. He called about him Chiefs Skiff, Buchanan and Smith, and Assistant Chief Hornsby of the Department of Electricity, and each was given one or two groups in which to make the assignments. The Director-General and the four chiefs, with Assistant Chief Williams of the Manufactures Department, met shortly after and allotted space with a great degree of rapidity.

"There will be no cessation of this work until the space is all awarded," said Col. Davis. "Mr. Allison is too ill to continue the work, and it has become a necessity to push it forward. Before the end of the week there will be no space left unassigned in the department."

Chief Robinson of the Machinery Department has cleaned up everything in his building, with the exception of a few thousand square feet, which will be retained for emergencies.

The foreign countries are ahead of domestic exhibitors from the fact that their space was awarded many months ago to commissions representing the several governments. Domestic exhibitors have been less fortunate because of their great number and the desire to discriminate fairly between their applications. When Chief Robinson closed his office last Thursday evening he had ruled out 500 of the 1200 applicants for space. In the manufactures department the eliminations will be much greater; not more than one in eight will receive an allotment.

Allotments in the mines, electricity, agriculture, horticulture, forestry, live stock and fine arts are also practically made.

"L" Road at the Fair.

The standards for the elevated electric railway at the World's Fair grounds are all in place. A force of eighty men are now engaged in putting up the beams, and by February 1 the entire road will be ready for track laying. Within 30 days the first train will be running over a part of the road, in an experiment as to equipment and speed. By April 1 the railway will be in active operation, as it is estimated that Jackson Park will contain a population of 10,000 people by that time engaged in the work of preparation for the opening.

The foundations for the Power-House and Office Building are in place, just southwest of the Forestry Building, and work on the superstructure has begun. The news of the early completion of the elevated road will be received with much satisfaction by the small army of fair employees who have been tramping to their offices through a mile or more of snow from the nearest railway station.

The cars for the first train are nearly completed at Wilmington, Del. They are open summer cars, with two trucks and eight wheels and a carrying capacity of 100 passengers each. The motor cars will also have eight wheels, with power applied to each wheel, and will carry passengers.

It is estimated that trains will run over the road 12 miles per hour, including the ten stops in the full run of three and a half miles. The stations will be covered platforms, with stairways leading to the tracks above. Tickets will be collected at the stairways, the same as on ordinary elevated roads.

Outside the standards, which are of wood, the construction will be practically the same as the Alley "L," except somewhat lighter. The electric wires or trolleys will run alongside the tracks, and not above in the usual way of the trolley system.

The company constructing the novel railway is the Western Dummy Railway Company, and was organized solely to build this one road as an experiment. Twenty-five per cent. of its gross receipts will go to the exposition. The fare charged will be ten cents, long or short haul.

The Boilermakers' Fight.

A bill for an injunction against the World's Columbian Exposition was filed in the Superior Court at Chicago on the 9th inst. by the Babcock & Wilcox Company of New Jersey. The bill sets forth that the complainant, one of six firms of boilermakers known as the Temporary Association, received a contract for boilers from the World's Fair. The companies of the Temporary Association make boilers

of a certain approved type, and the device of any one of the firms may be safely used in connection with the devices of all others. The six firms are the Abendroth & Root Mfg. Company of New York, the Campbell & Zelt Company of Baltimore, the Stearns Mfg. Company of Erie, Pa.; the National Boiler Company of New Brunswick, N. J.; the Heine Safety Boiler Company of St. Louis, and the complainant company of New Jersey. The complainant, under the impression that only the six named companies were to construct boilers, having been awarded a contract, deposited a bond of $10,000 for the satisfactory performance of the work and expended a large sum of money in pursuance of that contract. Now it is informed that the Stirling Boiler Company, maker of another type of boilers, is to be allowed space for boilers of that type, and the complainant company demurs against this action of the World's Fair on the ground that it increases the complainant's risks under its bond and establishes a condition under which the Babcock Company would not, knowing it to exist, have offered to bid for work. Therefore the complainant prays that the defendant, the Columbian Exposition representatives, be enjoined from allowing the Stirling boilers to be put in.

On the 12th inst. Harlow N. Higinbotham, President of the World's Fair, filed his answer to the bill of the complainants, in which he places the matter in a different light. In the first place Mr. Higinbotham repudiates the Temporary Association, and denies that any contract was made with the companies of that association to the exclusion of other companies. Mr. Higinbotham denies that the World's Fair ever assured the firm of Babcock & Wilcox that it should be allowed to furnish all additional power required for the main steam plant or an exclusive right to put in boilers. It is admitted as a fact that the Babcock & Wilcox Company were awarded a contract in May to put in 10 boilers for certain rentals, but it is further alleged that the company have failed to meet the terms of the contract, which specified that the boilers were to be in place by September 1 and ready for continuous service after September 15, and it is averred that the apparatus is not even now ready for service. Concerning the allegation that Chief Engineer Sargent contracted with the complainant company for additional steam capacity, the answer declares that the power to make awards rested in the Council of Administration and in no other body whatever.

Of chief importance, however, is the reply of President Higinbotham concerning the conditions under which the Babcock Company is allowed to put in its boilers. The answer states that they were accepted and assigned space simply as exhibits, and that it would contravene the spirit and letter of the act of Congress creating the exposition to allow one company to exhibit and to exclude another equally desirable exhibit. The Stirling Company, declares the answer, applied for space for an exhibit upon the same conditions as were imposed upon the Babcock & Wilson Company, and their application was allowed. The claim that the introduction of Stirling boilers will bring an element of danger into the concern is denied on the ground that the Stirling device is not of perilous construction.

Judge Ewing referred the matter to a master.

Vehicle Men Pleased.

Work in the vehicle division of the transportation department is now completed. Supt. A. A. Abbott of the vehicle division has finished the allotment of space and received receptances and information for the catalogue from all exhibitors and turned the same over to Chief Smith, who has approved the work. The plats with the list and information and plans of allotment will be delivered to the Director-General for his approval, when the permits to occupy the space will be made.

The vehicle division is the first one of those in the department of transportation exhibits to be completed. The space applied for in this division amounted to 232,000 square feet, the amount allotted 90,000, and exhibitors seem to be well pleased. All applicants have been accommodated, although many have not received as much space as they would like. The special committee appointed by the Carriage Builders' National Association visited the city last October. After examining the floor of the building they recommended that it be covered with wood carpet with handsome borders on the boundary of each space. As there was no charge for space, they thought exhibitors could afford to expend something in fitting it up. The recommendation was received with hearty approval. A very handsome design of glass sign has been ordered by the department. It is mounted on metallic standards. These features will add very materially to the general effect of the exhibit and show up the goods to the best possible advantage, the details of which are looked after by the chairman of the committee, C. Frederick Kimball of Chicago.

Miscellaneous.

The Galloway engine to be used for driving the machinery in the British section is to be supplied by Messrs. Galloway of Manchester. It is of horizontal superposed compound condensing type, and is to indicate 70 horse-power at 70 revolutions per minute with 100 pound boiler pressure. The high-pressure cylinder is 17 and the low-pressure 30 inches in diameter, both having a stroke of 3 feet 9 inches.

Secretary Hirst of the installation department received notice of the shipment of a model of a modern steamship from the great shipbuilding firm of Furnace & Co. of West Hartlepool, England, and a quantity of ores from Mexico.

Space has been allotted the Consolidated Mfg. Company of Philadelphia to show a model brush factory in operation. Ten or twelve brushmaking machines will be set up, so as to show the making of brushes in all its branches.

The unexampled development of the advocation of electricity for street railroads is well shown in the statistics compiled by the *Street Railway Journal*. During the year 1892 there was an increase in the mileage of electric roads of 1878 miles, a decline of 842 miles in the horse roads, a gain of 52 miles in cable roads, and a decline of 22 miles in steam dummies, thus showing how largely horse railroads have been converted into electric lines. At the close of last year there were in operation in the United States 11,665 miles of street railways, the motive power being distributed as follows: 4460 miles horse; 5939 electric; 646 miles cable and 620 miles steam. The number of cars in use has reached the large figure of 38,400, which is nearly 15,000 in excess of the number of passenger cars in steam railroad service. It is stated that the investment in electric roads during 1892 has been probably not far inferior to that in railroad extensions during the past year.

The Chicago, Rock Island & Pacific Railway Company have just issued a new through freight tariff book of 261 pages, covering rates from Chicago and its vicinity to all points in the West, Northwest and Southwest. We have also received from the same company a copy of the Western classification in full, but in miniature form, of date January 1, 1893.

Southern Pig Iron Freights.

The Queen & Crescent route has issued supplement No. 4 to East-Bound Pig Iron Tariff No. 3, effective January 2, giving the rates on pig iron in carload lots from Southern furnaces to Boston, New York, Philadelphia, Baltimore and points east and north of a line drawn from Buffalo, N. Y., to Bristol, Tenn., thence to the Atlantic Coast. The rates of some of the more important points are given below:

* Dayton and Rockwood only.

The Deep Waterway Convention at Washington completed its work on Friday, forming a permanent organization to continue the agitation in favor of a ship canal on American soil, to connect the great lakes and the Atlantic. Resolutions were adopted urging the passage by Congress of the bill providing for the necessary surveys.

The Commissioner of Navigation, in reply to a circular sent out by him asking for information, represents that the shipping interests of the country, so far as the foreign trade is concerned, are in a desperate condition. He therefore urges the necessity of measures for its restoration and advocates the establishment of a mercantile marine and naval reserve on the principles established by Great Britain. This suggestion seems to meet with a general favorable response.

ROOFING AND CORNICE.

The Country Cornice Shop.

XIII.

By Cornice Worker.

GUTTER SPOUTS.

Fig. 17 represents a hanging gutter with spout attached. These spouts can be made of tin, galvanized iron or copper. In putting up angle spouts, as shown at A', Fig. 17, it is customary to cut a scallop, as shown, so as to make a neat finish. As this is often done by hand, and hardly ever gives accurate results, Fig. 18 has been prepared showing how to obtain the pattern, for when we once have the pattern it can be saved for future use or a dozen spouts made and kept in stock to be used when required. To obtain the pattern of the scallop cut, no matter what size the pipe is, proceed as follows: Let A, Fig. 18, represent the plan of pipe and B the elevation. Care should be taken to draw the scallop in its correct position in elevation, as shown. Divide the plan A, Fig. 18, into an equal number of parts, as shown by the small figures 1, 2, 3, 4, &c, from which drop perpendicular lines until they cut the scallop line, as shown in elevation. At right angles to the perpendicular lines or lines of the pipe draw the stretchout of the plan A, Fig. 18, as shown by C D, the small figures on the stretchout corresponding in number to those on the plan. At right angles to the stretchout line C D draw lines indefinitely from the small figures, as shown, which intersect with lines of corresponding numbers, drawn at right angles to the lines of the pipe from the intersections on the scallop line, as shown. Referring to the elevation, Fig. 18, it will be seen that we have two points, namely, E and F, which we carry upward, as shown by the dotted lines, until they cut the plan as shown by X X X X of plan to the stretchout, as shown.

At right angles to the stretchout line C D draw lines from X X X X, which intersect with lines drawn at right angles to the lines of the pipe from the points E and F, Fig. 18. A line traced through these intersections will be the required pattern for the scalloped mouth of spout,

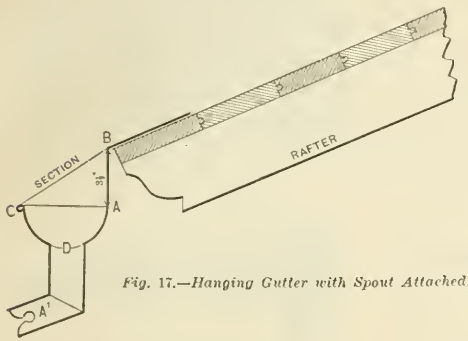

Fig. 17.—Hanging Gutter with Spout Attached.

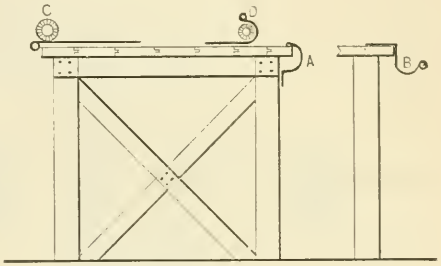

Fig. 20.—Rolling the Gutter on the Bench.

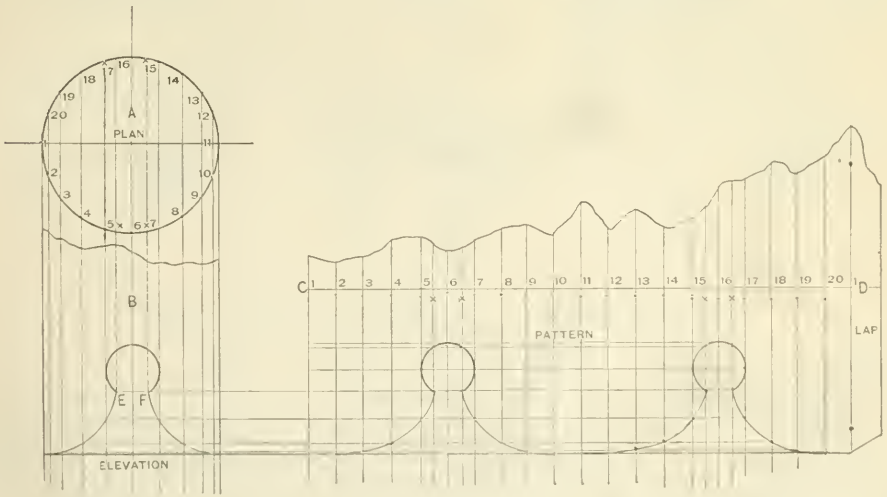

Fig. 18.—Plan, Elevation and Pattern for Mouth of Spout Shown in Fig. 17.

as shown in Fig. 17. A lap is allowed for riveting, as shown.

MAKING EAVE TROUGHS.

Now let us suppose that we have a hanging gutter or eave trough to make, 24 feet 6 inches long, the water to run from left to right standing in front of the gutter and the wire bead to be on the outside,

Strike any chalk line upon the floor or bench, as shown by A B, Fig. 19. Assuming that 7-foot sheets of iron are used, then for 24 feet 6 inches there would be required three sheets 7 feet long and one piece 3 feet 9 inches, allowing 3 inches for laps, as shown by the dotted lines C, D and E, Fig. 19. We now bead the three sheets and the one piece. Next get the

place the line drawn through the double dots upon the line on the piece M to the right, and on the chalk line to the left, performing the same operation with the sheets K and J. As the double dots shown at F, Fig. 19, represent the high part of gutter, the next step is to measure 3½ inches from the double dots H, Fig. 19, as shown at P. Then strike a chalk

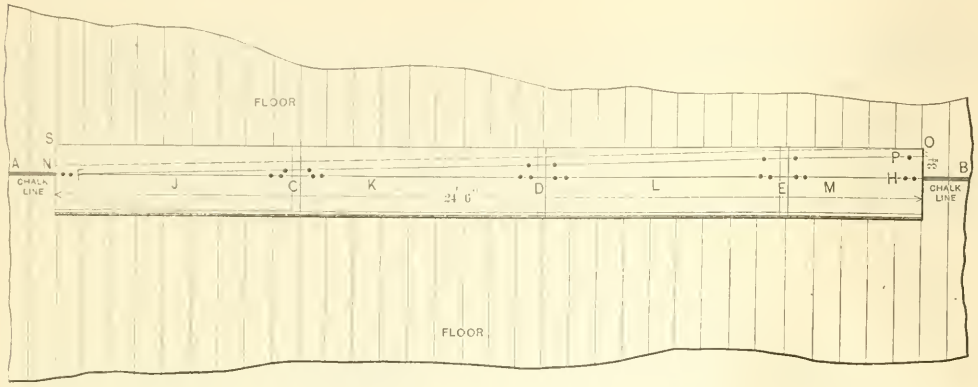

Fig. 19.—Method of Laying Out Gutter on Floor to Obtain Pitch.

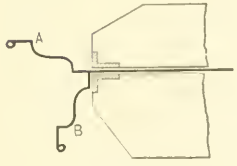

Fig. 28.

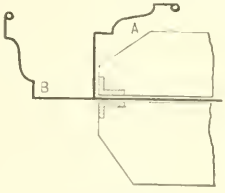

Fig. 29.

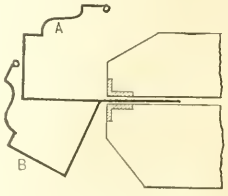

Fig. 30.

THE COUNTRY CORNICE SHOP.

the pitch to be 3½ inches on 24 feet 6 inches—or, in other words, the pitch to be 3½ inches from A to B, Fig. 17. Two flat heads will be required, which can be pricked from the section shown by C A D for the highest point of gutter, and B A D C for the lowest point, allowing for wire on C A for the small head and C B for the large head. There are different ways of laying out the pitch, Fig. 19 showing one method.

stretchout of C D A, Fig. 17, place upon and lay it off across the beaded sheets, marking at each end of the sheet the double dots, as shown on the line F H, Fig. 19. Draw a line through each sheet on the double dots. As the water is to run to the right, we start on the right side with the piece M, placing the line drawn through the double dots upon the chalk line A B, Fig. 19. Then take the sheet L, and giving 1 inch lap, as shown at E,

line from P to F, as shown, and which will be the line on which to make the bend. If a straight line is desired on roof, strike a line as shown by N O, Fig. 19, parallel to the line P F. The portion at S O to be cut away. In striking the pitch, as shown in Fig. 19, the bead should be laid downward.

In rolling the gutter, as shown at C, Fig. 20, place the bead downward as shown, and, taking a gas pipe or bar to suit the

size of the gutter, place it on top of the sheet. Now grasp the pipe and bead, and holding the bead firmly against the pipe, roll the pipe gradually until it has the position shown to the right at D. It is understood that the rolling shall go no further than up to the double dots shown on the sheets in Fig. 19. In selecting the pipe to roll the gutter, it is better to take a smaller size pipe and have the gutter rolled smaller, for as soon as it is released after rolling the metal has a tendency to spring back.

Let Fig. 21 represent a section of the brake shown before in Fig. 1. After the gutter has been rolled accurately to the profile, place it in the brake as shown by A, Fig. 21, being careful that the dots are placed at the corner of the angle iron. Close the brake, fasten the hooks, press down the gutter, taking care to keep as close as possible to the angle iron so as not to press the half-circle out of shape, then, holding the gutter firmly with the left hand against the bottom of the brake and using the mallet with the right hand, make a sharp corner and the gutter will be in position, as shown at B, Fig. 21. In putting the gutter together strike a chalk line on the bench and with solder tack the bead on the line, as shown by A, Fig. 20. Then reverse it and hang it on the bench, as shown at B, Fig. 20. After the gutter is tacked with solder, rivet first and then soak seams well with solder.

OPERATING THE CORNICE BRAKE.

Let Fig. 22 represent a section of a molded gutter, which we desire to form on the cornice brake. After the sheet has been beaded, and the stretchout taken of the mold, the dots are placed where the bends are to be made.

obtain a sharp corner. Next place the molding as shown at A, Fig. 27, using the clamp and bar; press down over the bar, which will give the shape B. Again place the molding as shown at A, Fig. 28, press down firmly, being careful not to flatten the molding already made, and it will look as shown at B. Place the gutter as shown at B, Fig. 29, press upward until it has the position shown at A. Finally, place the gutter in position as shown at A, Fig. 30, press downward to the angle A B C, Fig. 22, and the gutter will look as shown at B, Fig. 30, corresponding to Fig. 22, the shape desired.

In bending different shapes of moldings it is advisable to take a strip of iron about 1 inch wide, bending it to the shape required, so as to find out which way the molding forms best.

PATTERN OF MOLDED EAVE TROUGH.

In Fig. 31 is shown the plan, elevation and pattern of molded gutter or eave trough, at other than a right angle, where it miters around a bay window, for example. To obtain the pattern proceed as follows: Let A, Fig. 31, represent the elevation, B C F G part of the plan. Divide the profile A into a number of equal parts, as shown by the small figures, 1, 2, 3, 4, &c., from which drop perpendicular lines until they cut the miter line D E. At right angles to B D lay off the stretchout of the profile A, as shown by the small figures on H J. At right angles to the stretchout J H drop lines indefinitely from the points on the stretchout, as shown, which intersect with lines of corresponding numbers drawn at right angles to B D from the miter line D E. A line traced through these intersections will be the required pattern for a miter at other than a right angle. It will be noticed that we have not proven the accuracy of the miter line shown in plan view, Fig. 31. To do so set the point of the compass at D and strike an arc which will intersect the line B D and D F at M and N. Then from the point N strike an arc, as shown, from O to E, and from the point M as center strike an arc intersecting the arc struck from the center N, as shown by O and E. Draw a line through the intersections O and E, which must correspond to the miter line drawn through the angle D and E, thus proving the accuracy of the miter line.

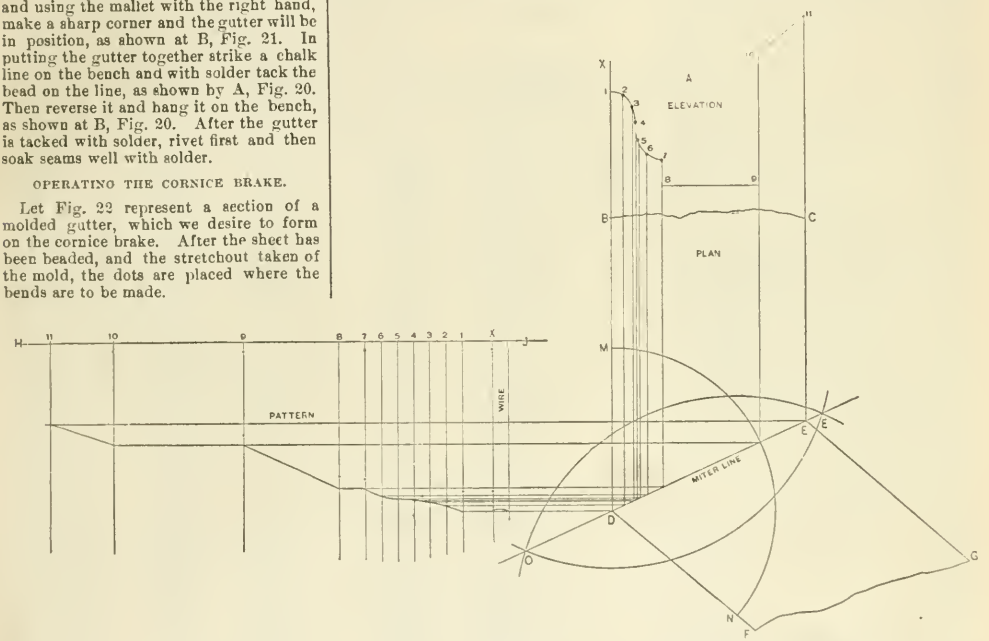

Fig. 31.—Plan, Elevation and Pattern of Gutter at Other than a Right Angle.

National Iron Roofing Association.

In *The Metal Worker* last week we printed a brief telegraphic report of the seventh annual meeting of the National Iron Roofing Association, held at Wheeling, W. Va., on January 11 and 12. We take pleasure this week in presenting a more detailed account of the proceedings, together with the table of gauges, which is to be brought to the attention of Con-

THE COUNTRY CORNICE SHOP.

In Fig. 23 is shown the first operation. As the bead is to go on the inside of the gutter, place the bead downward, and the dot in the right position, as shown at A, Fig. 23. Press down A and it will look as shown at B, Fig. 23, using the mallet as before explained to obtain a sharp corner.

As a right-angle bend cannot be obtained on account of the bead butting against the bottom of the brake, use the gutter tongs shown in Fig. 24, so as to obtain a right angle. These tongs are usually made of steel and cost about $3. Fig. 25 shows the second operation. Place the bead inside of brake, as shown at A, Fig. 25, being careful that the wire is placed in bead to keep it from being flattened; and having obtained the right size bar and clamp, press A over the bar, and the molding will look as shown at B. Now place the sheet as shown at A, Fig. 26, and press down to the position shown at B, using a mallet to

gress with a view to having it adopted as the legal standard.

MORNING SESSION.

The convention was called to order at 11 o'clock a.m., with President Battelle in the chair, 21 representatives being present, representing 14 firms, as follows:

E. A. Langenbach, the Berger Mfg. Company, Canton, Ohio.
J. H. Eller, J. H. Eller & Co., Canton, Ohio.
T. C. Snyder and Harry Ball, Canton Steel Roofing Company, Canton, Ohio.
G. E. Needham, B. F. Powers and E. C. Powers, Garry Iron Roofing Company, Cleveland, Ohio.
W. T. Graham and J. J. Holloway, Standard Iron Company, Bridgeport, Ohio.
J. G. Battelle and James Hicks, Cincinnati Corrugating Company, Piqua, Ohio.
R. J. Hyndman, W. G. Hyndman & Co., Cincinnati, Ohio.
C. H. Connor, Charles H. Connor, Louisville, Ky.
W. A. List, W. A. List & Co., Wheeling, W. Va.

E. C. Ewing and Alexander Glass, Wheeling Corrugating Company, Wheeling, W. Va.
Charles Aldrich, Missouri Iron Roofing & Cornice Company, St. Louis, Mo.
F. E. Codding, E. E. Souther & Co., St. Louis, Mo.
M. H. Crittenden, M. H. Crittenden & Son, Minneapolis, Minn.
W. C. Cowgill and S. W. Nicholson, Cambridge Roofing Company, Cambridge, Ohio.

Letters of regret were read from James A. Miller & Bro., Chicago: The Heberling Metal Roofing Company, Havana, Ill., and Porter Iron Roofing Company, Cincinnati, Ohio; also a communication from Decatur Steel Roofing Company, Decautar, Ill., who hoped to join the association at its next annual meeting.

On motion of Mr. Connor the printed minutes of the semi-annual meeting were approved without reading. Mr. Connor, as chairman of the Executive Committee, made the following report, which was read by the secretary:

"The chairman of the Executive Committee of the National Iron Roofing Association begs leave to report that his absence in Europe during most of the year has made it impossible for him to meet with the committee or attend the mid-summer meeting of the association. The work of the year must, for these reasons, be reported by the secretary. The interest and enthusiasm shown by our Wheeling members in hospitably providing for the entertainment of this meeting, not only gives promise of a good session, but augurs well for the future of our association. The value and necessity of our organization is each year more apparent."

Mr. Snyder of Canton, Ohio, chairman on Gauges, made a verbal report that the committee having received the unanimous support of the members, has been working in conjunction with John Jarrett, secretary, representing the Association of Sheet Iron Manufacturers, the Galvanized Iron Manufacturers' Association and the Amalgamated Association of Iron and Steel Workers for the necessary legislation to secure the passage of a bill by Congress establishing by law the proposed United States standard gauges for all uncoated iron and steel sheets.

He also said that he would leave the same evening for Washington, D. C., to appear on the following day before the Congressional Committee on Weights and Coinage, in reference to the subject and representing the above-named associations.

President Battelle spoke of the value of the proposed gauge, its completeness, giving weights in even ounces in fractional pounds, and the thickness in decimal fractional inches; also the equivalents in the metric system, this latter feature being added at the suggestion of the Association of Mechanical Engineers.

Mr. Aldrich, chairman of the Committee on Freights, made a verbal report showing that in the present state of the various freight associations it was almost impossible to secure even a hearing. Mr. Snyder made a report upon the same subject, stating his efforts to secure same classification on returned roofing tools as upon roofing. Upon motion the action of Mr. Snyder was heartily indorsed and he was asked to report to the secretary at the earliest moment the result of his efforts, these results to be reported to the members by the secretary.

Secretary Hyndman then read his report, followed by the treasurer's report showing the financial condition of the association.

Mr. Connor then offered the following resolution:

Resolved, That the imperative interests of this association demand the united, as well as individual, influence of its members should be used against the use for roofing purposes of iron lighter in gauge than 81 pounds to the 100 square feet in the flat.

After hearing from each member present it was found that the firms represented were fully in accord in their practice for the year just past with the resolution offered. The resolution was unanimously approved.

The chairman then appointed Messrs. Needham, Eller and Aldrich a committee to nominate officers for 1893, their report to be presented at the afternoon session. On motion of Mr. Aldrich it was resolved that the minutes of the morning session be read at the opening of the afternoon session for the benefit of the members who might come in, and they be allowed to express their views on the subjects discussed at the morning session. Adjourned to meet at 2 o'clock p.m.

AFTERNOON SESSION.

The afternoon session was called to order at 2.30 p.m., and the minutes were read for the benefit of the members not present at the morning session.

Expressions upon the matters under discussion were made by the representatives of the Standard Iron Company and the Cambridge Roofing Company. On motion of Mr. Aldrich it was unanimously resolved that the matter of prices be referred to the Executive Committee, with instruction to investigate and report at the semi-annual meeting and report a final plan at the next annual meeting.

Mr. Aldrich invited the members to hold the next annual meeting at St. Louis, Mo., and the invitation was unanimously accepted, the date fixed being the second Thursday in January, 1894.

On invitation of James Hicks, the semi-annual meeting was appointed to be held at Piqua, Ohio, in July next.

The Nominating Committee made the following report:

Chas. H. Connor, president.
Jas. Hicks, vice president.
R. J. Hyndman, secretary.

COMMITTEES.

Executive.	*Freight.*
Jas. G. Battelle,	Chas. Aldrich,
Chas. Aldrich,	Alex. Glass,
W. T. Graham.	B. F. Powers.

Gauges.
T. C. Snyder,
H. P. Lloyd.

On motion of Mr. Aldrich the secretary was ordered to cast the vote of the association for the above officers.

Mr. Connor and Mr. Hicks then responded, thanking the association for their appointments.

The thanks of the association were extended individually and collectively to Mr. Snyder, who although engrossed with his own affairs was willing to forego the pleasures of the banquet and the excursion to go to Washington, D. C., in behalf of the association on the gauge question.

The secretary was authorized to extend the thanks of the association to the proprietors of the McClure House for the use of their parlors, and the meeting then adjourned.

Wednesday evening was given up to a banquet, at which 60 covers were laid, and which was participated in by all members and a large number of rolling mill representatives.

On Thursday the members spent the day inspecting the various establishments in and about the city, and made an excursion upon the terminal railroad.

As of interest in connection with this report, we print above the table of gauges and weights referred to, which the association desire to have established as the legal standard.

THE CHESTER SLATE COMPANY, whose quarry is located near Chapman Quarries, held their annual meeting at Easton, Pa., Saturday, January 7, and the followirg Board of Directors was elected: Theodore

Whitesell, president; J. A. Weaver, vice-president; B. F. Schnabel, secretary and treasurer; Charles A. Morrison and H. C. Cavanaugh. John H. Geiser was re-elected superintendent.

FLASHINGS.

An article in the Denver *Republican* of recent date states that there are about ten firms in that city engaged in the manufacture of cornices, &c., with about 60 employees, the annual production of the shops amounting to about $200,000.

With the beginning of the current year the Sagendorph Iron Roofing & Corrugating Company of Cincinnati made a new departure. They will continue to manufacture and sell their specialties which are covered by United States patents in all respects as heretofore. Their general business of selling corrugated iron, sheet steel roofing, V-crimped and roll-cap roofing will be conducted under the name of the American Roofing Company, a corporation having large plants at Cincinnati and at St. Louis. The authorized capital of the American Roofing Company is $150,000 and, this company will have the advantage of two of the largest plants in the country for the manufacture of their products. The company will supply their customers with all varieties of iron and steel roofing of the best material and most approved construction. The *personnel* remains unchanged. Geo. M. Verity, the very popular and successful manager during the past four years, will continue in the same position, and R. C. Phillips will remain as superintendent. The Cincinnati plant, which was lately destroyed by fire, is being rebuilt at the old site, on the very latest improved plans, and will be admirably adapted to their business. Their shipping facilities are excellent, the city wharf being only 100 yards distant, while they are centrally located between the upper and lower railroad freight yards, besides having a switch of the Pennsylvania Railroad directly in front of their factory, thus giving them shipping facilities for handling their products.

M. F. Conner, secretary and treasurer of the Eclipse Machine Company, Troy and Cohoes, N. Y., will leave about February 1 for an extended trip through the West, visiting the trade interested in the use and sale of the Eclipse Gutter Beading & Forming Machine made by that company.

The Montreal Roofing Company of Montreal, Canada, enjoyed a good volume of business during the year just brought to a close, and their work is to be seen in connection with many prominent buildings in the city named. Among the structures may be mentioned the new Queen's Hotel, roofed with rock asphalt; the Balmoral Hotel, roofed with actinolite cement; the St. James Club, the roof of which is covered with actinolite asphalt; the warehouse of Evans & Brothers, covered with composition roofing 1¼ inch thick, and said to be practically indestructible; the Temple Emanu-El and the main building of the Royal Victoria Hospital. In addition to these were a number of residences, schoolhouses, colleges, and a portion of the Montreal Seminary.

R. G. Kelso, Cleveland, Ohio, has recently patented an eave-trough fastener consisting of an end-slotted cross bar which is curved at one end around a bead, while the other end is formed with a groove which fits in the inner edge of the eave trough. A band passes around the bead under the cross bar and around the body of the eave trough, one end being passed through this cross-bar slot and bent down to make it fast, while the other end is carried a little beyond the middle cross bar and under it, where it is riveted. The roof band is so bent as to fit over the eaves of the roof, and is provided with holes by which it may be nailed to the roof. The three pieces are held together by a rivet on top and by the engagement of one end of the band first referred to in the slot of the cross bar.

J. C. McFarland, manufacturer of cornices, skylights, &c., 2511 to 2519 State street, Chicago, is to furnish the Spanish tile roofing, copper work, skylights, slate roofing, &c., for the new depot building of the Illinois Central Railroad at Twelfth street, in that city.

The Pennsylvania Hard Vein Slate Company, whose quaries are located at Edeimans, held their annual meeting at Easton, Pa., Thursday afternoon, January 5. G. W. Geiser, N. A. Fulmer, James Young, Birge Pearson and R. H. Trach were elected directors. The board organized by the election of G. W. Geiser as president, James Young vice-president, N. A. Fulmer secretary, and Birge Pearson treasurer.

The plant of the Sagendorph Iron Roofing & Corrugating Company, Cincinnati, Ohio, which was recently destroyed by fire, will be rebuilt according to plans which have just been drawn. As the material has been purchased, operations will commence as soon as the weather will permit. The new structure will consist of two sections covering a total depth of 204 feet by 60 feet in width. The front section will be three stories high, having a depth of 134 feet, and the rear section will be two stories in hight, with a depth of 70 feet. The two sections will be divided by a substantial fire wall. The first floor of the front section will be used as a stock and receiving room, also for the heavier machinery used in the production of the company's specialties. The first floor of the rear section, 17 x 70 feet, will be fitted up for stabling purposes. The center room of the rear section, 21 x 70 feet, extending to the roof, is to be constructed of fire-proof material, entirely isolating it from the remainder of the premises and will be used for the paint department, in which all paints will be ground and mixed and applied. The west side of this section, 18 x 70 feet, will be given up to boiler, engine and fuel room. The second floor of the front section will be occupied by the company's offices, 30 x 60 feet, stock room and light manufacturing. The rear of the second floor section will be used for the tin and galvanized iron work department. The third floor will be occupied by storage paints, as will also the basement. The company will have one third more room than in the old plant, and 25 per cent. additional productive capacity. The new plant will be operated under the name of the American Roofing Company, of which Charles Aldrich is president, H. B. Lloyd vice-president, Geo. M. Verity general manager, and R. C. Phillips superindent. It will be noted that no change in management is made, the business of the Cincinnati plant being conducted as heretofore, with added advantages of increased capital and facilities.

In response to inquiries made by the Canal Committee of the New York Board of Trade and Transportation, Horatio Seymour, ex-State Engineer and Surveyor, has sent an elaborate discussion on the question of a ship canal between the lakes and the Hudson, with the conclusion that it is impracticable. He estimates the cost of the canal at about $600,000,000 and describes the difficulties in the water supply as unparalleled in canal construction heretofore.

Shop Stories.

CONCERNING FISH.

Our shop recently had a job of considerable magnitude to execute for a customer whose residence is situated on the banks of a small river famous for bass fishing. Competent mechanics with assistants were sent to put up the work.

A few days after their return, and during the noon hour, while the "kids" were discussing the contents of their dinner buckets, their conversation turned on fishing. Jack, who had gone as a helper on the job referred to, related his luck at taking in the "black beauties," as he called the bass, and succeeded remarkably well. His story had, no doubt, been materially helped out by listening to real fish stories told by summer boarders at Jack's boarding house Sunday afternoons during his stay.

Frank, who has a very imaginative mind, responded by giving his piscatorial experiences in the waters of the Big Sandy. Others in turn related their most wonderful adventures except Bill, who had never been sent out of town. In fact there did not appear to be anything left for him, and we felt a good degree of compassion for the youth. However, we were not long left to waste our sympathies. He either believed all the stories related to be real fishy or real lies, and promptly objected to having the curtain rung down.

He told them that several years ago, when he was only a boy, the Ohio River rose so high that it flooded the streets of the town where his parents resided, and he actually went boating in second stories of dwellings and business houses. Directly the flood subsided his people set about cleaning up the filth and mud left in their premises. They were unable, however, to get the water-closet to work, and sent for a plumber to search out and remedy the difficulty.

The plumber, having urgent domestic duties of like character himself to execute, did not respond to the call for several days. When he came he found the closet trap obstructed with something, and reaching down into it with his hand, seized and pulled out a fine large and live catfish weighing ever-so-many pounds.

Some of Bill's shopmates seemed disposed to doubt the truth of this, while others thought it possible for a fish to have found its way there while the river was so high. Bill stoutly asserted to the truthfulness of his story, stating that he saw the fish taken out himself, but added that that did not relieve the trouble with the water-closet.

A further examination was made, and resulted in finding that while the catfish had been imprisoned in the closet trap it had raised a whole litter of kittens. They found six well grown ones with their eyes open. After their removal the closet was all right. Swiped Joint.

N.B.—Bill got the pie.

The American Federation of Labor, in session at Albany, recommend that all machine labor in State prisons be abolished, also the system of convict labor in State prisons. The latest report of the State prison officials fails to show that the efforts made thus far to abolish machinery and to restrict the labor of convicts have had any effect to reduce the burdens of the taxpayer, or to promote the welfare of the convict, but quite the reverse.

A bill to make the records of the Interstate Commerce Commission and certified copies of them *prima facie* evidence in courts of law was favorably reported to the House from the Committee on Commerce. This provision was neglected when the Interstate Commerce act was passed, and copies of the records have only been admitted in evidence by consent of counsel.

"The Metal Worker" Competition in Skylight Pattern Cutting.

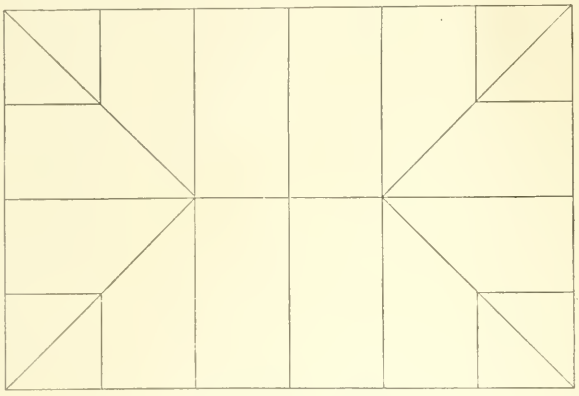
FOR the purpose of calling forth from the readers of *The Metal Worker* the best method for obtaining the patterns of a hipped sheet-metal skylight and to advance the art of pattern cutting, it has been decided to present a prize competition, the particulars of which are as follows :

Each contestant will be required to furnish the plans, elevations, necessary sections and profiles of skylight, also to design the various parts of same, giving to each part the shape that may be considered best adapted for the purpose ; drawings to be of such size as required for publication in *The Metal Worker.*

The skylight to be so constructed that the condensed moisture from below will be conveyed outside, the frame work of skylight to be made of sheet metal, and the usual thick glass to be used in connection with same ; the method of securing glass and caps to bars or rafters to be clearly shown.

While the plan may show a certain size of skylight, indicate the method by which one of similar pitch but different size can be constructed, the same miter patterns being used.

Show method of obtaining length of the various bars or rafters, using for the purpose any diagram, plan or elevation that may be necessary. Also show method of obtaining shape or section of hip bars.



Outline Plan of Skylight.

The skylight for which the patterns are required is such as would be placed over a light shaft, or on a roof or bulkhead, the size of opening being about 4 x 6 feet. As there is no particular rule governing the pitch of the skylight, it can be given such pitch as may be desired. While the wooden curb or frame of air shaft, roof or bulkhead is supposed to extend a sufficient distance above the roof to give ample opportunity for securing skylight to same, contestants will be at liberty to use such methods as appear best adapted for the purpose of fastening skylight, where brick and angle iron constitutes the frame.

The accompanying plan is not intended to give details of construction, but to indicate in a general way the shape of skylight for which drawings and patterns are required. Where there are two or more similar parts in the skylight, so that the pattern for one part will answer for the other, it will be only necessary to show details of one part. As indicated in plan, the skylight is to have a hipped roof, and as previously stated, the roof can be given any desired pitch.

PRIZES.

In the contest above described, two cash prizes are offered, as follows :

First prize.....$75.00.
Second prize..... 50.00.

The drawings and accompanying description may be sent by either mail or express, charges prepaid, and must reach the office of *The Metal Worker* not later than April 1, 1893.

They are to be addressed as follows :

THE METAL WORKER,
96–102 Reade street, New York.
(Skylight Competition.)

Each contestant is to select a fictitious name or device, which is to be placed on the description and each sheet of the drawings. The real name and address of the writer is to be put in a sealed envelope, on which is to be placed the fictitious name or device used on the drawings. This envelope is to be inclosed with the drawings and description.

The manuscript and drawings are to be sent flat, not rolled, and the writing should be on one side of the paper only. It is also suggested that legal cap paper be used for the description, the same size of paper for the drawings, and that ink be used for writing the descriptions ; the drawings to be either ink or pencil.

The various drawings and descriptions received up to the time set for closing the competition will be submitted to a committee selected for the purpose, who will decide between competitors.

In deciding between contestants, four points will be given consideration, as follows :

1. Originality.
2. Mechanical completeness of the method proposed.
3. Neatness of drawings submitted.
4. Clearness in description.

The right is reserved to publish all the drawings and descriptions received in this competition, and also to return to the authors the drawings and descriptions received in the competition in case they are not considered suitable for publication or worthy of an award of prizes.

THE TIN SHOP.

Triangulation in Pattern Cutting.—XVII.

By Triangle.

PATTERN FOR THE FRUSTUM OF AN OBLIQUE PYRAMID.

In Figs. 126 and 127 let A B C D be the side elevation of article, E F G H the plan of base and K L M J the plan of top. E'' K'' J'' H'' is the elevation of front, under which is drawn the corresponding plan, as shown by E' F' G' H' L' M' J' K'. An inspection of the plan will show that the distance between E F and K L is the same as that between J M and G H, from which we can infer that the two sides are alike. For the pattern of the side corresponding to H J M G in plan proceed as follows: Draw any line, as $a\ d$, in length equal to H G of plan, or, what is the same, A D of elevation. At right angles to $a\ d$ erect the perpendicular $d\ k$, upon which set off the slant hight of side, as shown by E'' K'' of front elevation. From k, measuring in either direction, set off the distance k M, k J of plan, as shown by $k\ c$, $k\ b$ of pattern. Connect $a\ b$ and $d\ c$, which completes the pattern of the side. The pattern for the front can be set off in the same manner, or by the aid of the T-square as follows: Draw $e\ h$ parallel with E' H' of plan. With the T-square at right angles to $e\ h$ erect the perpendicular $a'\ b'$, in length equal to A B of side elevation, which gives the slant hight of the front. Draw $k\ j$ parallel to $e\ h$, cutting $a'\ b'$ at b'. With the T-square at right angles to E' H', drop lines from the points E' H', cutting $e\ h$, and also lines from K' J', cutting $k\ j$, all as shown. By connecting the points $e'k$ and $j\ h$ the pattern for the front of article is obtained, as shown by $e\ k\ j\ h$. The pattern for the back of article, as shown by $g\ m\ l\ f$ in Fig. 128, is obtained in a similar manner; $f\ g$ and $l\ m$ are of the same length as F' G' and L' M' of plan. On the right angle $f\ d\ c$ is laid off the distance D C of

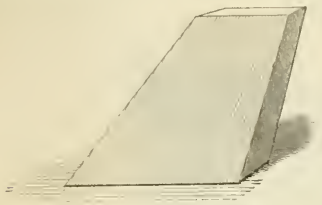


Fig. 125.—View of the Finished Article.

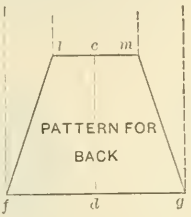

Fig. 128.—Pattern for Back of Article.

Fig. 130.—Diagram of Triangles Drawn on Dotted Lines in Plan.

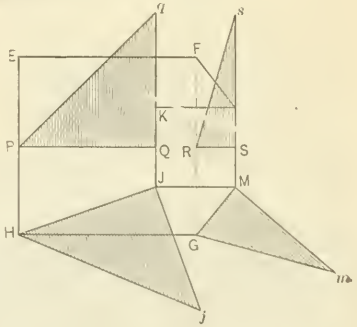

Fig. 131.—Triangles Drawn on Solid Lines in Plan.

PATTERN FOR THE FRUSTUM OF AN OBLIQUE PYRAMID.

side elevation, making *d c* equal to D C. By connecting the points *f l m g* the pattern for the back of article is the result.

To obtain the pattern by triangulation it will be necessary to draw a number of triangles, the bases of which can be obtained from the plan, their hight being equal to the straight hight of the article, and their hypotenuses will give the distances from points in the base to points in the top of the article.

In Fig. 129 is shown a diagram of triangles drawn from the solid lines in plan. Draw the right angle J W X, making W X equal to the straight hight of the article. From W set off the length of line J H of plan, and connect J H with the apex X, which gives the distance from H in plan to J in the top. In a similar manner, set off from W the lengths of lines Q P, G M and R S, and connect the points thus obtained in W J with X. The right angle H' Y Z in Fig. 130 is constructed in a similar manner. Y Z represents the straight hight of the article, and on Y H', measuring from Y, is set off the length of dotted lines in Fig. 132, and the points connected with Z, as shown. If the triangles in Fig. 129 were cut out and placed on their respective base lines in the plan in Fig. 131, their appearance would be as shown. The same can be said of the triangles in Fig. 130, if placed on the dotted lines on plan in Fig. 132. In describing the pattern for the article, we will locate the seam or joint as indicated by R S in plan.

The pattern can be described by the use of the diagrams of triangles in Figs. 129 and 130, in connection with the plan, or by the aid of the diagrams in Figs. 131 and 132. In the present instance we will use the diagrams in Figs. 131 and 132. When describing the pattern shown in Fig. 133, one can commence at the right, at the left, or from the center, as may be desired. We will first describe the pattern for the part of article shown by E K J H of plan. Draw the line E'' H'', in Fig. 133, equal in length to E H of plan. With H'' as center, and H' *k'*, Fig. 132, as radius, describe a small arc (*k''*), which intersect with one struck from E'' of pattern as center, and H *j* of Fig. 131 as radius, thus establishing point *k''* of pattern. With *k''* of pattern as center, and K J of plan as radius, describe another small arc (*j''*), which intersect with one struck from H'' of pattern as center, and H *j* of Fig. 131 as radius, thus establishing point *j''* of pattern.

With H'' of pattern as center, and H G of plan as radius, describe a small arc (G''), which intersect with one struck from *j''* of pattern as center, and G' *j* of Fig. 132 as radius, thus establishing point G'' of pattern. With G'' as center, and G *m* of Fig. 131 as radius, describe a small arc (*m''*), which intersect with one struck from *j''* as center, and J M of plan as radius, which establishes the point *m''* of pattern. Point R' is struck from G'' as center, R G of plan as radius, and with *m'* of pattern as center, and R' *m'* of Fig. 132 as radius. The remaining point *s''* represents the distances M S and R *s* of Fig. 131. The points F'' R'' *s''* *l''* can be obtained as above described.

A model similar to that shown in Fig. 135 can be constructed by forming a duplicate of the pattern into the required shape. For a model showing half of the article, draw A B C D in Fig. 131, which is a duplicate of the side elevation. Below A D draw the half plan of base, H A D G, and above A C the half plan of top, B J M C. At right angles to C D set off C M' and D G', equal in length to C M and D G respectively. In a similar manner, from A B set off B J' and A H', in length equal to B J and A H. Connect M' G' and H' J'. The parts of the pattern are to be formed at right angles on the lines A B, B C, C D, and D A, the result being as shown in Fig. 135. The dotted line J G of model, which represents the hypotenuse of the triangle J' *j'* G' in Fig. 132, can be represented by means of colored thread.

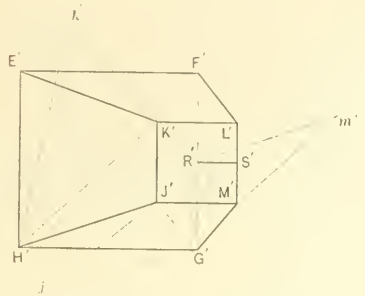

Fig. 132.—Triangles Drawn on Dotted Lines in Plan.

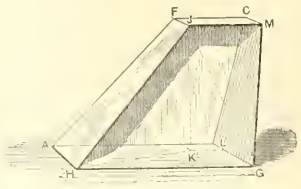

Fig. 135.—Model Derived from Pattern in Previous Figure.

PATTERN FOR THE FRUSTUM OF AN OBLIQUE PYRAMID.

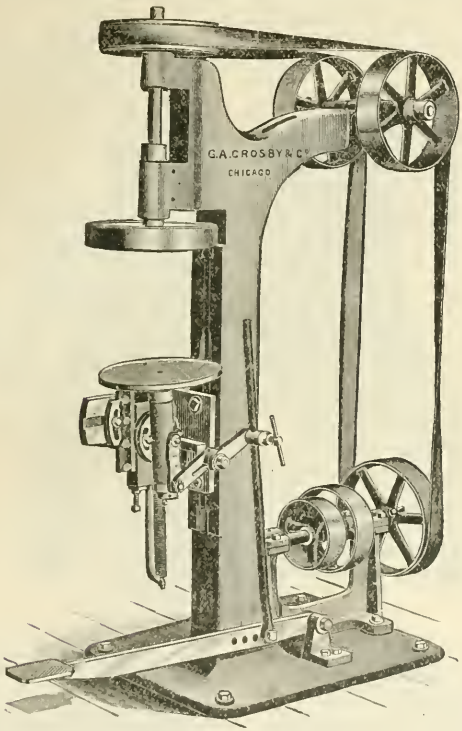
The New York municipal authorities propose to move speedily in carrying out the plans for the construction of a new city hall in the park. A new building in the modern style, comprising a large quantity of iron beams, girders and posts, would naturally endure for centuries, and at first thought the location chosen would seem to be very far down town. But a century hence the City Hall Park will be much more central than now with reference to population on Long Island and other environs geographically within the corporation limits. Between the two great contemplated improvements—the new city hall and rapid transit—the municipal treasury is likely to be well drained.

Chancellor McGill of New Jersey issued a decree for the appointment of a receiver for the Jersey Central Railroad because it ignored the order of the court to withdraw from the coal combine. The decree is held in abeyance pending an inquiry by a master in chancery.

Patent Wiring Machine.

The accompanying illustration represents a novelty in machinery for rolling or wiring the edges of sheet metal packages, which will recommend itself to manufacturers who realize the necessity for some cheap and effectual method of doing this class of work. Heretofore it has been practically impossible to either wire or false-wire conical or tapering vessels, except by the use of wiring dies, which are so costly as to prevent many of the smaller manufacturers going into the production of an extensive line of this class of goods. When wiring dies are used a special die is necessary for each different sized vessel, involving a large outlay of money, while requiring constant attention and frequent repairing.

The machine which G. A. Crosby & Co. of 176 South Clinton street, Chicago, Ill., are now placing on the market possesses many points of advantage for doing this class of work. Among other things, they refer to its cheapness; to the fact that either straight or tapering vessels can be wired or false-wired on the same machine; that it is capable of handling vessels from 24 inches high and 18 inches in diameter down to work no larger than an ordinary varnish can nozzle, and that the work produced is of a superior quality.



Patent Wiring Machine.

Builders of steamships at lake ports must take a costly lesson from experience. There is no longer any doubt that the loss of at least two of the largest steel steamers built by them is due to serious faults in construction which developed weakness amidships. More evidence to this effect is coming to light. The steel steamer "Maritana" of the Minnesota Steamship Company, built and launched at Calumet last summer, was towed into the shipyard of the Globe Iron Works at Cleveland, where experts found that the boat had narrowly escaped breaking in two. Hundreds of rivets were gone and steel plates were separated as much as ¼ inch in many places. The steamer will be repaired at a cost of $75,000.

Micanite.

Eugene Munsell & Co., 218 Water street, New York, sole agents for the Mica Insulator Company of Schenectady, N. Y., are introducing, under the name Micanite, a new electrical insulating material. This is described as made of pure India sheet mica and the least possible amount of cement of the highest resistance. It can be furnished in any desired form or size. They inform us it has passed the experimental stage, been thoroughly tested and is now in actual use by large electrical manufacturers. While it is true mica has long been recognized as a valuable insulator, the difficulty for many uses has been its great cost, no suitable substitute having yet been found to take its place. Now, however, they have succeeded in utilizing what heretofore has been a waste product. In cutting plates for various uses there has always been considerable refuse. The mica scrap is just as valuable for insulation, the difficulty having been to properly prepare it. This has now been accomplished and this material can be supplied in any form required. The compound readily lends itself to manipulation under mechanical processes, such as sawing, shearing, punching and boring. This production was recently described at length in a paper read before the American Institute of Electrical Engineers by Edward P. Thompson, the title of the paper being "Micanite and Its Application to Armature Insulation."

New York now has a boss stevedores' trust.

Barnes' Friction Clutch Pulley.

The accompanying cuts illustrate the principle of the construction of a new friction clutch pulley made by J. H. & D. Lake Company of Hornellsville, N. Y. Fig. 1 is a sectional side view of the Barnes screw lever friction pulley in released position, showing the driving hub keyed to the shaft.

Fig. 2 is a sectional end view of the friction hub encircled by friction ring, the former of which is cast in one solid piece with the pulleys. Projecting lugs on opposite sides of the driving hub of the ring drop into lugs, or lug cavities of the friction ring, and when the clutch is on these lugs take all the driving power.

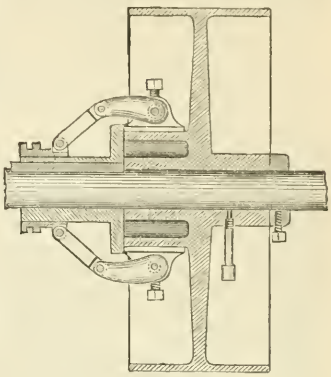


Fig. 1.

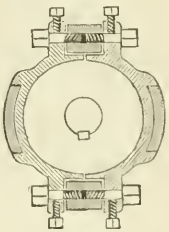

Fig. 2.

Barnes' Friction Clutch.

This is claimed to be an improvement over the old bolt-fastening system, the bolts of which are more liable to be affected by the twisting strain upon the hub from the friction of the clutch. At the extreme top and bottom of Fig. 2 is shown a view of a simple device which obviates the use of more complicated machinery. It is a lever nut on each side of the friction ring, one-half of the nut being cut with a right thread and the other half with a left thread. Sufficient space between opposite sections of the ring is given for contraction of clutch, which is effected by means of right and left thread screw bolts entering the lever nut from opposite sides, secured by set screws. Duplex levers are attached to these nuts at their upper section and to the hub at their lower section. When the shipper sleeve is thrown against the flange by the operating lever, the duplex lever turns the nut sufficiently to produce all necessary friction. The screw bolts are adjustable to any desired pressure, however, in case the clutch should ever become lax. They give the pulley a positive grip and absolute release from the hub by each opposite shift of the operating lever, without the use of springs. These friction clutch pulleys and cut-off couplings are adapted to both heavy and light work.

Steam and Hot-Water Circulation

English Practice in Hot-Water Heating—XIX.*

BRICK SET BOILERS (CONTINUED).

The most customary way to set a saddle boiler, especially of medium and large size, is to provide flues up and down along its exterior as follows: The boiler is placed upon a level with the furnace bars, the hight of this point being fixed by the position of the door, &c., of the furnace fittings that are furnished for the job. The front of the boiler comes up tight against the brick-work front (against which the iron furnace front is fixed), and the joint between the boiler and brick work must be a thoroughly sound and tight one to prevent the draft and flame making a short cut this way into the upper flue (see Fig. 75†). This brick work should be 9 inches thick.

There is frequently a difficulty in getting the iron front and fittings to hold securely against the front brick work, owing to several causes. Firstly, the expansion and contraction of the metal and, again, the opening and shutting of doors, and use of stoking tools, are the chief causes of the work getting loose. This happens especially if the fittings are merely secured with holdfasts in the brick work. The object in referring to this is to explain a method of securing the front which will not only keep the fittings in place under the roughest of usage, but which will tend to keep the front brick work tight against the boiler also, as is so necessary, as just mentioned. This method is to have iron rods or stays extending from the iron furnace front right through along the sides of the boiler and clipping round its furthest end. These can be easily tightened up by having the front ends coming through holes, screwed, and with nuts on them.

From the illustration it will be seen that previous to the boiler being placed in position, its base is built up, and it is arranged that the brick work extension of the fire box at back (for the bars do not extend the whole length of boiler) is exactly level with the top surface of the fire bars. The bars are also exactly level with the dead or dumb plate in front, the front ends of the bars coming just level with the front of the boiler, as shown. Sometimes, when it is desired to place the boiler lower than usual, or to do with a shallower boiler pit, the bars and back brick work are kept level, as just explained, but some 2 to 4 inches below the lower edge of the furnace door, instead of being level with it. This inequality is made up by having the dumb plate sloping, as Fig. 76.

The common use of the dumb plate now is to complete the furnace bottom from the bars to the front; it is a solid and strong plain plate, as bars are not needed here, and brick work would do, only that clear way must be left beneath, the space below being the ash pit. The dumb plate is sometimes used in the manner originally intended—viz., to place a charge of coal upon, that it may dry and volatilize some of its lighter gases, which, passing over hot fuel, are consumed, the charge of fuel being afterward pushed on, a considerable reduction in smoke and waste products being the result. It will be noticed in Fig. 75 that, from extreme front to back, the furnace bottom is quite level. This is how it should be in the usual way, and simplifies the stoking and reduces the chances of rough usage.

* Reprinted from the *London Builder*.

† This and Figs. 77, 78, 79, are from the catalogue of Jenkins & Son, Rotherham.

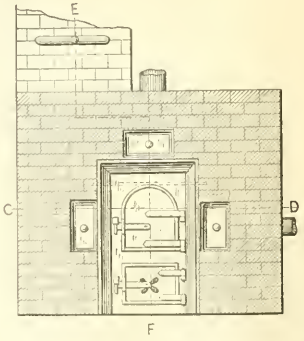

Fig. 79.—Front Elevation of Saddle Boiler in Position.

ENGLISH PRACTICE IN HOT-WATER HEATING.

The furnace bars usually occupy about two thirds the area of the fire box with a plain saddle boiler, but the area varies with the pattern of the boiler, as has been fully explained (Article XV). The rear ends of the bars are sometimes made to rest on the brick work with a light flat bar beneath, or they may be supported on a stronger bar, clear of the brick work, as shown. In any case, their upper surfaces have to be quite level with the brick work in question. The front extremities rest upon the rebated edge of the dumb plate, or in some cases the dumb plate has no rebated edge, and both this plate and the fire bars rest upon a strong bar which extends from side to side. This latter method is not so good as the former, not so neat, and no stronger, for the dumb plate being supported by the brick work at each of its ends, will carry the fire bars well. The fire bars are kept forward, as shown, so that the inner and direct heating surface of the boiler may have the fullest benefit of the heat and heated gases, &c., before passing away at the back into the flues.

The rear end of the boiler does not reach to the back wall by some 5 inches to 8 inches (according to size of boiler);

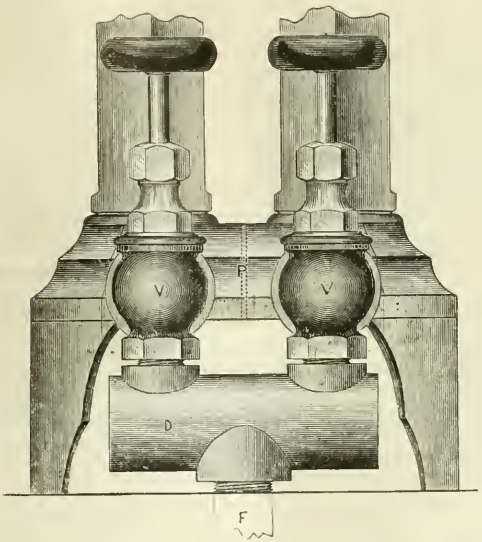
this space forms the passageway for the heated products from the furnace to the flues of the boiler. There is, however, some brick work built in this space with the object of guiding the heated gases in the directions they are intended to go. In this space between the boiler end and the wall at the back is firstly built a fire-brick bridge, as shown in Fig. 75, extending about half way up the back of the boiler; and as marked in Fig. 77, which shows the fixing work in plan, say 6 inches above the level of the fire bars. The object of this "bridge" is, 1, to prevent the fuel working from the fire box into the flues; and, 2, to check the too free escape of the heated gases, &c. As mentioned, this bridge extends as nearly as possible half way up, as shown in Fig. 75, and also in the sectional elevation to be shown directly. With small boiler, a thick fire-brick slab is used for this purpose, but the space at back should be tolerably roomy; no harm will result, as would happen if we made the other flues too wide. The action or direction of the flame at this point is to hug the boiler, to cling to it, we may say. This last illustration shows the two box soot-doors that have to be provided for cleaning the lower parts of the flues; another soot door is provided over the top of the boiler in front.

At a point outside the boiler, a little above where it commences to describe a circle, two mid-feathers have to be provided, one on each side, as Fig. 78; they are marked "brick." The object of these feathers is to divide the flueway round the boiler into three; they extend from the extreme back to within about 5 inches to 7 inches of the front of the boiler, as shown in dotted lines in the first illustration. From the last drawing just shown it will also be seen that their position is a few inches above the brick bridge, or, in other words, there is a clear way for flame and heat to pass over the brick bridge and into the flues each side of the boiler underneath the feathers. This is shown by arrows on both Figs. 75 and 77. After the flames have traversed the length of these flues to the front, they enter the top flue together, there being provision made for this by terminating the feathers some inches short of the front of the boiler, as shown in dotted lines at Fig. 75.

They then pass along the top of the boiler from front to back, and into the chimney at the rear. It is supposed that with a low chimney and low draft the heated products have lost most of their heat after having made this journey.

To make the explanation as clear as possible, we have spoken of the flame and gases finding their way through these flues; of course it is understood they are impelled or carried by the draft induced in the chimney.

This last drawing is in section and elevation across the front ends of the furnace bars, and it will be noticed that the brick work forming the bottom of the flues is also exactly level with the fire bars and the rest of what may be called the base. The side flues are, as a rule, say 4 inches for boilers up to 3 feet 6 inches in length, and 4½ inches up to 5 feet, and 5 inches up to 7 feet. This is large enough, as we must always remember that flame and heated gases and products heat by contact only; that is, they must actually impinge against or touch an object, to heat it effectually.



End View of Bundy Improved Duplex Radiator Base.

It may be as well to explain the customary way of making the arched flue way over the boiler, this method requiring no wood work supports and suiting all sizes alike. After building up the brick work at the sides to the point where the boiler begins to arch over, dry ashes are obtained and laid over the top to a thickness that agrees with the size of the flue required. The brick work is then carried over, resting upon this bed of ashes, and when it is set the ashes are raked out.

The final point to be mentioned is the second bridge, which is carried over, extending from mid-feather to mid-feather each side, and above the other bridge at back. This bridge is seen in the first illustration. It is introduced to prevent the flame taking a short passage up at the back of the boiler into the chimney, which will probably exist just there. Some make this bridge by carrying an iron bar from side to side about 5 inches or 6 inches above the lower bridge and building brick work on this to the required shape and extent. This is not a good plan, for, unless the bar be a piece of small stout girder iron, it will contort or sag down and cause very bad results. It is best to arrange to throw an arch over from feather to feather.

Fig. 79 shows the boiler complete, the boiler itself being out of sight, of course. Boilers can be had with waterway mid-feathers if desired; also the lower bridge at the back can be formed in the boiler with a waterway through it, and when the boiler is arranged to be fed through the top, by a proper feed-hole provided, it can also have a waterway front. The fixing of the saddle boiler has been dwelt upon rather fully, but it is a necessary information and goes far toward making a man competent to fix almost any other boiler.

Bundy Improved Duplex Radiator Base.

The accompanying illustration represents an end view of the Bundy Improved Duplex Radiator Base made by the A. A. Griffing Iron Company, Jersey City, N. J. This attachment is designed with a view to making an ordinary Bundy two-row radiator equivalent to three distinct sizes, by offering means of regulating the heat. The partition P divides the base into separate compartments, regulated and controlled by the valves V. The header D is used for convenience and economy in connecting up, as it saves pipe and fitting and cutting of the floor. To secure the necessary room for the header the high-leg Bundy base has to be used in which the center of tapping for any size of hole is 4½ inches from the floor, and thus allows ample space for cleaning out under the radiator and for free circulation of air. The manufacturers claim that in the point of economy, the Duplex Base saves in fuel alone many times its additional cost in a few weeks, and they also refer to its efficacy in preventing the overheating of apartments. The base, which is adapted to either steam or hot water Bundy radiators, can be used with either one or two pipe systems. With two pipes, two headers and four valves are required to each radiator, while with the one-pipe system, one header and two valves only are needed. By means of the division in the radiator the heat can be regulated so that in very moderate weather the valve supplying the rear row of loops is opened; in fairly cold weather the steam or hot water is turned on the front row of loops, the rear ones remaining idle, while in extremely cold weather both valves are opened and the entire radiator brought into use.

Stopping Leaks in Steam Pipes.

From I. R., *Norwich, N. Y.*—How can a small leak be stopped in steam and hot water pipes without taking out and putting in a new fitting?

Answer.—Our correspondent's query is broad. In order to answer it we will have to assume different interpretations. In the first place, it can be inferred that the leak is in the pipe and not in the fitting. The next inference is that on account of the smallness of the leak it is desired to remove the portion of the pipe in which the leak exists without being compelled to use a new fitting. If the leak is at the weld of the pipe the best thing to do is to remove the "split" piece of pipe and replace it with a sound piece. To do this the piping will have to be removed from the point at which there is a flange union or left and right threaded fitting and by doing so, if all the fittings are sound, they can be used again, thus saving a new fitting. In prac-

tice the time occupied in doing this is a great deal more valuable than one or two new fittings. It is therefore not unusual to break one fitting on the defective part of the pipe and replace it by a new fitting and use a flange union or right and left threaded coupling to finish up the connection.

If the small leak exists between the thread on the pipe and the thread on the fitting, and the pipe has been well screwed into the fitting, if no red lead or paint has been used it will generally "make up" in a few days. Should a small leak between pipe and fitting show no sign of diminishing, it can be stopped by using white lead at the leaking point with some twine wound tightly round the pipe against the threads on the pipe and against the face of the fitting. By this means the leak can be stopped, as the white lead is forced between the threads and into the cavities. When the white lead has become hard the twine winding can be removed, and the appearance of the joint will be like any of those which have been properly screwed together. This remedy is only practical when the leak is small. Another remedy for small leaks is the use of sal-ammoniac, but its use should be rather avoided than advised, and it certainly should not be used where a pipe leaks on account of a flaw in the weld. A pipe with an imperfect weld should not be used. In screwing pipe threads into fittings care should be taken that each thread is clean, and a little oil only should be applied, and the use of red lead and such other cements should be dispensed with.

HEATING NOTES.

From a letter recently received from the J. F. Pease Furnace Company, Syracuse, N. Y., we learn that the sales of their Economy air-combination and hot-water heaters show an increase of some 30 per cent.; also that their Economy steam and air combination heaters are selling in larger numbers than ever before. Their works have been running since summer until 10 o'clock at night, and even now they are running overtime to keep up with their orders. Among recent shipments was one of a steam and air combination heater to Japan for a missionary building. George D. Hoffman, who handles the Economy heaters in Chicago, has also made a contract with the official representative of the Emperor of Japan for heating the administration buildings on the World's Fair grounds with an Economy hot-water heater.

The Exeter Machine Works, 32 Oliver street, Boston, favor us with a handsome calendar, which is bare of advertising matter, excepting that which is covered by the monthly sheets. For ornamentation it has in the center a group of three very attractive-looking children, flanked on either side by four of this concern's well known radiators. Under this display are the words, "seven Exeter babies."

The Raymond & Campbell Mfg. Company, Middletown, Pa., issue a very pretty illustrated circular relating to the Lindemuth Sun steam and hot-water heaters of their manufacture. The circular, bound in dark reddish-brown leatherette, contains a very careful description of the Sun apparatus, with numerous cuts showing general and sectional views of the heaters. Tables of dimensions and prices are also presented, and a little card that accompanies the circular announces that they furnish their customers with a full line of printed matter, also their improved specification or contract agreement, which, they say, is printed with copying ink, and is a convenient article.

The Holland Radiator & Mfg. Company, Chicago, Ill., issue a notice under date of January 15 that they have removed to 89 Lake street. They also mention that A. H. Fitz, formerly Northwestern manager for the American Radiator Company at Minneapolis, has associated himself with the concern, and in the future will manage the financial affairs of the company.

The American Radiator Company, 111 and 113 Lake street, Chicago, have rented part of the commodious building occupied by the Bogue Lead Company, 1810 Blake street, Denver, Col. A full line of sample radiators will be on exhibition and sufficient stock carried for the filling of orders. The new establishment will be in charge of T. Guy Haywood.

The L. H. Prentice Company, steam and hot-water heating and ventilating engineers, 203 and 205 Van Buren street, Chicago, enumerate the following recent contracts in Chicago and vicinity: Power, heating and mechanical ventilating apparatus for the new Chicago club building. Have just completed the heating of Cobb Hall, Divinity Dormitory, University of Chicago, and are now engaged in heating Kent Chemical Hall, Snell Hall and Walker Museum for the same university. Are about to equip Burley & Co.'s new store, 145 and 147 State street, with a power and heating plant. Among other large plants may be mentioned the Victoria Hotel, Chicago Heights; Augustana Hospital, the New Briggs House, Newberry Library, Boyce office building, Washington Park club house, James Ingram Hotel, Mayer estate building, Kuh, Nathan & Fischer building, Barry Bros.' Hotel, D. W. Irwin building, Huck & Young office building and Lexington Hotel; for the Chicago & Northwestern Railroad, power plant, depot, emigrant building and office building in Chicago; also depots at Rockford, Ill.; Fond du Lac, Wis.; De Kalb, Ill., and Council Bluffs, Iowa. Also outside the city the University of Wisconsin, Madison, Wis.; F. S. Hodge building, Duluth, Minn.; the Casino Club, Edgwater, Ill.; Highland Park club house, Highland Park, Ill., and Milwaukee street railway power plant, Milwaukee, Wis. Also a number of prominent dwellings in Chicago, among which may be mentioned those of R. W. Patterson, Jr., H. A. Blair, John Clay, Jr., E. C. Potter, Gen. A. C. McClurg, and Prof. Lawrence Laughlin.

The Hardware Club of New York.

Arrangements are being actively made for the dinner of the Hardware and Metal trades, to be held on Tuesday evening, February 21, as announced in the following official circular, which has been sent out to the members of the club:

FIFTH DINNER
OF THE
HARDWARE AND METAL TRADES.

RECEPTION, 6 TO 7 O'CLOCK; DINNER, 7 O'CLOCK.

The fifth dinner of the Hardware and Metal Trades will be held under the auspices of the Hardware Club of New York, in the Banquet Hall of the Manhattan Athletic Club, Madison avenue and Forty-fifth street, on Tuesday evening, February 21.

Tickets, $5 each (wines a la carte), can be had from A. D. Clinch of Underhill, Clinch & Co., 94 Chambers street.

We are under obligations to the officers of the Manhattan Club for the courtesy of extending to our guests the privilege of inspecting their magnificent building in all its departments during the evening.

The demand for tickets for the dinner of 1892 exceeded the supply, and it is hoped that applications for tickets this year will be sent in early, as the issue will be limited, so as not to exceed the comfortable seating capacity of the hall.

The opportunity of securing tickets is first offered to the members of the Hardware Club, and we shall esteem it a favor if you will kindly advise us by January 25 the number of tickets you desire.

Dinner Committee:

Alfred D. Clinch, *Chairman*,
Peter McCartee.
John L. Varick.
Edward C. Van Glahn.
Eugene Bissell.

It is expected that there will be at the dinner a large representation of the trade from within as well as outside the city who have not as yet formally consummated their membership in the club, but, as announced above, tickets are first offered to the members. It will be well for any who are desirous of being present at the dinner, whether at present members of the club or not, to send in their applications early. The following additional persons have recently joined the club:

David Homer Bates,
The Bradstreet Company,
New York.

Jared Chittenden,
The Bradstreet Company,
New York.

Charles F. Clark,
President The Bradstreet Company,
New York.

Brent Good,
57 Murray street, New York.

O. D. Gray,
The Gast Lithograph and Engraving Co.,
New York.

Chas. S. Houghtaling,
3 Park place, New York.

John Oliver,
The Bradstreet Company,
New York.

Ralph H. Plumb,
Plumb, Burdict & Barnard,
Buffalo, N. Y.

Thomas H. Spaulding,
Jersey City, N. J.

William K. Stansbury,
Eagle File Company,
Middletown, N. Y.

T. M. Cox having acquired the interest of E. and W. W. Dilworth in the Hardware, Stove and Implement firm of E. Dilworth & Co., Vermont, Ill., will with his brother, E. G. Cox, continue the business under the firm name of T. M. Cox & Bro.

THE LETTER BOX.

A Good Suggestion.

From A. R., *Pennsylvania.*—I regret that I do not see any more letters from some of the old-time tinners. Can they not be induced to contribute a letter to the apprentice boys or for their benefit and tell them how to do and how not to do work, and also to impress upon their minds the importance of becoming good, neat and speedy workmen? Let us hear from both the old and the young boys.

Note.—We hope this appeal will not be lost upon the large fraternity of old-time tinners, who could amuse and instruct one another and the younger generation by making free use of our columns. The ways and customs of the old tinners are fast passing out of use, and machinery is doing much to change their trade. But for all that, the recollections of the old-timers would not be the less entertaining. We know that many an old tinner has resolved to write us some story of his early days, and we are sure that some of them have got as far as getting out pen and paper. This time, with the new year, we hope they will go a little further and write the letter and send it to us.

Tinners' Trade Secrets.

From H. J., *Chicago.*—It is indeed jocose, but nevertheless a fact, that there still exists a certain class of tinners, who in my opinion come under the head of fanatics, who still consider that any information they may impart to another of the fraternity is not in keeping with good sense, and only do so under the principle of the man who married the girl to get rid of her. I had a little experience last week which brought back reminiscences as to the closeness of a few of these sheet-metal working cranks one comes in contact with every once in awhile.

Invariably these communicative (?) gentlemen (?), who consider their store of knowledge unbounded, take great umbrage if an artisan who is perhaps less informed asks them as to the manner of procedure of a certain job or the correct method to obtain a certain pattern. Of these I would respectfully inquire whether they are not laboring under an hallucination? I think on mature reflection they will have to admit that they are, also that they palpably see the fallacy of their ways. Not being puffed up with my own egotism and admitting that there were others who were better informed, I asked a supposed friend how a certain culinary article was made, and if he would be kind enough to send me a pattern for the same. Nine months elapsed and I still received no reply, so concluded my request had escaped his vigilence in some unaccountable way, and that his dilinquency was purely inadvertent, as he being a supposed friend, a deacon in a church, &c., I never imagined he would have the discourtesy not to reply at least, as not replying to a letter is equivalent to not answering when spoken to, so I wrote him again inclosing sketches elucidating my requirements, now eight months since. Being somewhat despaired in the intervening period, I continually wrote a friend living in his vicinity, I fearing he had succumbed to the inevitable, to which he invariably replied that my fraternal and personal friend told him laconically that "he had me down on his *agenda* paper," but when my name would be eliminated from said document my friend considered it hard to say. Such pertinacity is indeed worthier a better cause. Alas, will the spirit ever move him?

I cite this one instance, as I have had several like experiences, merely as an example, and to exhibit how a certain class consider all they know (which is indeed stupendous) to be trade secrets, and would never divulge anything to a fellow workingman for reasons best known to themselves. But these self-same people are usually the very class who are adepts at asking questions and seeking information, thus adding to their already overflowing store of knowledge. While I do not believe in a person carrying, metaphorically speaking, all he knows on his shirt sleeve, I think when one of his fellow artisans asks a question and it be one that he is competent to answer, he should (leaving friendship and perhaps indebtedness out of the question), if only for the advancement and betterment of his craft, answer him to the best of his ability.

Duty on Tin Plates.

From S. B., *Kingston, S. C.*— We tinners down here are under the impression that the duty has been taken off from tin plates. If so, when did the law go into effect?

Answer.—Our correspondent and his friends in the part of the country from which he writes are laboring under a decidedly wrong impression, for to the best of our knowledge and belief the duty is what it has been since the passage of the last tariff bill. It is $2\frac{2}{10}$ cents a pound, and there is no law enacted to alter it from that figure. What will happen under the new administration is uncertain, but what has happened up to date has not affected the tariff on tin plates.

Galvanized Sheet Iron.

From S. E. B., *Englewood, Ill.* — Will you please inform me how many years galvanized iron has been made? Also, what is the difference between "Juniata" and "Apollo," other than the trade-mark?

Answer.—The process of coating iron saucepans with zinc is known to have been in use in France as far back as 1786. The first patent for galvanizing iron sheets was, however, taken out in England in 1837, by H. W. Craufurd; and another for zincing of iron, which had been previously tinned, was obtained four years later by E. Morewood—also in England. We believe the pioneer in the manufacture of galvanized sheet iron in this country was the late Delaplaine McDaniel of the McCullough Iron Company. The material was first made at the company's mills in Maryland in 1852. Galvanized sheets are now almost invariably made of steel. Both the brands named above are of that material, and their quality, like that of all B. B. steel sheets, is pretty nearly identical.

Trouble With a Hydraulic Ram.

From C. L., *New Haven, Conn.*—Please advise me in the following case: There is a hydraulic ram which works intermittently now, although in use for several years. That is, the supply of water, fall and delivery have been tested. The ram has a new air chamber and flow valve. The feed and discharge and service pipes are apparently clear from obstacles, and the outside valve when raised by the flow often remains up, but if pressed down to its seat will work for varying lengths of time. The ram has been tried since getting new pieces as above in all ways—that is, with a full head or minimum; all the joints made tight and the valves put in order, or so reported, and being new from the factory they probably are in good order. A late discovery is that the drive pipe is leaky near the ram and possibly in other places. There seems to be no lack of water from it. Under these circumstances should the failure to work follow from a leak in the drive pipe or from a fault in the ram?

Note.—A leak in the drive pipe will, undoubtedly, diminish the effects of the ram, since the action of this apparatus depends upon the momentum of the water when suddenly checked, and if the water can find an escape through a leak in the drive pipe it will not compress the air in the chamber as much as it would otherwise. And it is the compression of air in the air chamber that acts as a spring to push the water up from the discharge of the ram. Whether this leak in the drive pipe will account for the peculiar action of the ram in the case described by our correspondent is, however, another matter, and without inspection of the premises and careful inquiry into all the circumstances, we would hesitate to ascribe it to this cause. From those of our readers who have had experience in ram setting and repairing we would like to hear what their opinion is in this case.

To Find the Circumference of Circle.

From C. E. S., *New Haven, Conn.*—Please give me a simple rule for finding the exact circumference of a vessel from the diameter. I am quite sure that many of your readers do not know how to find the circumference, and I know the information would be useful.

Answer.—The common and most exact rule for finding the circumference of a vessel, knowing its diameter, is to multiply the diameter by 3.1416. For quick work the fraction $\frac{22}{7}$ is used for the multiplier. The circumference of a circle is about $3\frac{1}{7}$

times its diameter, but the relation between the length of the circumference and the length of the diameter is not an even fraction or decimal and can never be told with absolute accuracy. For all practical purposes, however, either of the rules above given is satisfactory.

Problems from the Country.

In a recent issue of *The Metal Worker* we printed a communication from "P. H.," New Madrid, Mo., giving a solution of the apple problem, and he added a note mentioning that he had sent in several communications before, consisting of a solution, a withdrawal and a second solution. The latter was published, but that it was not correct, either through an error of ours or our correspondent, is very amusingly told in the following, which we have just received. The rythmical allusion to the figure 3 is the 3 of the 30 in the second line, which should have read 20:

And still, to my surprise and terror,
I, after all, behold an error;
For there appears the figure three
Just where the figure two should be.
The error does exist. However,
To place it I will not endeavor.
It may be mine; it may be yours—
Readers will think it mine. Of course
If I said thirty, I meant twenty:
But surely now there has been plenty
Of time and stationery spent,
Of postage, too, just for one cent.

From S. W. M., *Ness City, Kan.* — In answer to the problem of "D. C. L.," which appeared in *The Metal Worker* of December 3, I would say he lost the 1 cent by selling more of the inferior kind of apple. My explanation is this: By bunching the apples 3 of 1 kind and 2 of another, or 5 apples for 2 cents, you will pay as many times 2 cents as 5 is contained in 60, which is 12 times, or 24 cents, 12 cents' worth of each kind. Since you get 3 for 1 cent, for 12 cents you get as many apples as 12 times 3, or 36 apples (of the inferior kind), and at 2 for 1 cent, 12 cents will buy 12 times 2, or 24 apples. Hence you will sell 36 apples of the inferior kind and 24 of the better quality.

Material for Gutters.

From J. L. F., *Memphis, Tenn.*—In answer to "W. D. M.," Sunbury, Pa., I would recommend him to try aluminum alloy, which has very little expansion and contraction, lies like lead and I believe is as durable as copper for ordinary purposes.

From H. A. G., *Grand Rapids, Mich.*—Replying to your correspondent, "W. D. M.," of Sunbury, Pa., whose letter appeared in *The Metal Worker*, January 7, I would advise him to get old-style roofing tin 8 feet long and 20 or 28 inches wide, or whatever width will suit best. Clean out the gutter and dry it thoroughly. Lock the tin well and solder well, using rosin, not being afraid to use the solder, but letting it soak in thoroughly. Take care not to bruise the tin, and after it is laid give two coats of paint, and before the last one dries give a coat of sand. Do not use ready mixed or so called iron ore paints, but take boiled oil and red lead. Before using the paint go over the tin with benzine or gasoline with a brush, the same as with a coat of paint. If your correspondent will follow these directions I think he will have no more trouble.

From D. L., *Memphis, Tenn.*—In answer to W. D. M. of Sunbury, Pa., I would say that my experience tells me that XX bright tin is not the best for gutters, as the expansion is greater and the cross seams are liable to break. IX tin is heavy enough and will give satisfaction provided the proper material is selected. Bright tin is best for gutters, but an extra coated plate should be used such as can be procured from any dealer in tin plates. A 6-pound iron should be employed in soldering the seams, not too hot, but hot enough to allow the solder to flow easily and soak into the seam. As much care is required in putting the gutter in as in choosing the proper material. The tin should be painted underneath and heavy building paper placed in the bed of the gutter. Always avoid driving nails in the tin of which the roof is made. Strip on the outside and lock to the strips, then finish by seaming against the face of the eave. Should a tin roof be on the building, edge and cleat the edge and lock the roof on. Cross seams in bright tin when well soldered hold better than in leaded tin. Nailing the eaves or inner side of the gutter offers a resistance to contraction and expansion so that buckling and breaks occur. Painting and laying paper underneath is the best method for preserving the gutter, as in most cases rust takes it from the under side. Attention should also be paid to the length of the gutter, which should not exceed 35 feet from the starting point. Should a building be so constructed as to require a long run it should be divided up and a down pipe placed (in a run of 70 feet two pipes should be placed). At the rise it should be so arranged that a standing seam should be made so as to stand 2 inches in hight. This will prevent breaking of cross seams.

Comparative Radiating Power of Black Sheet Iron and Galvanized Iron.

From F. J. S., *Washington, D. C.*— Please answer in *The Metal Worker* what the difference is, if any, in the radiating qualities of sheet-iron pipe of black and of galvanized iron. All other things being equal, some practical men here say that there is a difference of 10, 25 and even 60 per cent. between the two materials. It is my opinion that the matter can only be decided by scientific test and is not merely a matter of opinion.

Answer.—Certainly facts cannot be mere matter of opinion, and it is facts this correspondent seeks.

In the first place, the books give the radiating power of black sheet iron as 0.092 of a heat unit per hour for 1° of temperature difference between the radiating surface and the surrounding air and objects when the temperatures of the radiating and receiving surfaces are low. For polished zinc the radiating power is given for low temperatures as 0.04906 heat unit for each degree of temperature difference. Comparing these figures, we find the radiating power of polished zinc is 0.04294 heat unit less than that of the black sheet iron, and this difference is found to be very nearly 47 per cent. of the radiating power of the iron.

It might be supposed that galvanized iron, having a surface of zinc, would have the same radiating quality as that of polished zinc, but this would be a rash conclusion, because the surface is far from being polished. In fact it is not nearly as smooth as the surface of some black sheet iron. Any one who has seen galvanized iron has noticed the crystalline appearance of the surface. Below this surface at no great depth the zinc becomes alloyed with the iron.

It is probable that in the discussion referred to in the query the total loss of heat by galvanized iron pipes and black sheet iron pipes, both by contact of air circulating over them and by radiation proper, are included in the term "radiation," this being a common way among practical men of speaking of the passage of heat from a heated interior surface to exterior objects; and it is possible that the different values assigned by the disputants have been named, some for this total transfer of heat and others for the action of radiation pure and simple, which latter is, strictly speaking, independent of transfer of heat by contact of air. Both the loss by contact of air and by radiation proper are increased when the temperature of the surface giving off heat is elevated, as in steam coils, furnace radiators, &c., and if we could be certain that galvanized iron had the same radiating power as ordinary rolled zinc, we might compute very nearly its radiating power at the higher temperatures. Such an assumption would, however, be mere guess work.

Some years ago private experiments were made to determine the conducting power of galvanized iron of several thicknesses, such as are used in heating work, and also the radiating power. The experiments were performed in too rude a manner to be useful for rigid scientific work, but they gave figures that are probably sufficiently reliable for use in the practical work of heating buildings.

The conducting power of galvanized iron does not vary inversely as the thickness, as is the law for sheets, &c., made of a single homogeneous metal. If a sheet of this galvanized iron be cut across and closely examined it will be found to be an alloy of iron and zinc to a considerable depth on both sides, and the probability is that the zinc penetrates in a greater or less degree to the very center of thin plates; that is to say, plates of No. 22 Am. W. G. in thickness or less.

The tests referred to were on several thicknesses of sheets including Nos. 22, 20, 18 and 10 Am. W. G.

The black iron sheets and the galvanized sheets were made into tubes 3 inches outside diameter, and of a length that gave 2 square feet of surface. The work was done as well as available workmen could do it, but undoubtedly there were some small inaccuracies. The tubes were closed by soldering brass caps into the ends, these caps being tapped and threaded in the middle for the connection of ¾-inch inlet and outlet pipes. In testing the pipes some were placed in a vertical position in a room kept at 70° F., and so that all the water could be drained out of the pipes as fast as it condensed from the steam admitted to them. The water was taken out by a trap. The water thus condensed was taken as the measure of the heat transmitted and transferred to the surrounding air and surrounding objects. Steam was taken from a power boiler and reduced by a pressure reducer to 2 pounds per square inch as nearly as could be measured by a mercury gauge. A receptacle for separating and receiving any

water that might otherwise pass with the steam into the tubes was provided and kept well drained. Just before entering the top of the pipes the steam was superheated about 2°, to insure its freedom from any entrained water; the superheater being a coil of pipe immersed in a bath of a saline solution (acetate of soda) by which, when heated by a gas burner, a very even temperature could be maintained and applied to heating the coil. A saturated solution of this salt boils at about 256° F.; but to obtain the desired superheating, a temperature much below its boiling point was entirely sufficient. In this arrangement, therefore, the temperature of the steam admitted to the pipes to be tested was, as nearly as it was possible to regulate it, kept at 218° F., being superheated 2° F. The amounts of water condensed by pipes of each thickness varied very little. The following results are transcribed from a record of these tests:

Amount of Heat Transmitted by Pipes of Black Sheet Iron and of Galvanized Iron, per Square Foot per Hour, for a Difference of 1° F., the Pipes being Heated to 218° F. inside and the Surrounding Outside Temperature being 70° F.

Thicknesses American wire gauge.	Heat units per hour per 1° of difference for black sheet.	Heat units per hour for 1° of difference for galvanized iron.	Percentages in favor of the black sheet.
			Per cent.
No. 22	1.1349	1.0782	5
No. 20	1.2234	1.0887	13 3/100
No. 18	1.1612	1.0673	8 8/100
No. 10	1.1011	1.0593	3 79/100
Averages	1.15665	1.0684	7 49/100

The figures given for each thickness are the mean of four different tests each of one hour's duration. For some reason the No. 20 black sheet iron transmitted more heat than the thinner iron. Its surface, however, may have been in a state to radiate heat more freely than any of the other sheets. This supposition is the more plausible, as the fact is well recognized that a slight difference in smoothness affects radiation proper from metal surfaces very sensibly.

The results given are thought to afford a sufficiently near approximation to the average difference in heat-transferring power of these materials for most practical purposes.

Painting Conductor Pipe.

From G. R. C., *Mansfield., Pa.*—As we have a great deal of conductor spouting to be painted on the inside, I would like to hear, through *The Metal Worker*, the experience of tinners who have to do this kind of work. Our way has been to tie a cloth on the end of a wire and swab out the pipe; but this is a very slow and dirty way of painting it.

A Horse Trade.

From S. W. M., *Ness City, Mo.*—How much will I make in the transaction, if I sell my horse for $90, buy him back for $80, and sell him again for $100.

The Apprentice in the Country.

From J. H., *Bridgewater, Mass.*—Our business has changed very much during the last 10 or 15 years. Formerly we made all the tinware we sold and bought castings and made parlor stoves for the fall trade, and this with the pump trade and tin roofing gave us work enough, with a chance to teach a boy a trade. Now we do the plumbing and sheet-metal work usually done in a country tin shop and iron pipe work as well. We need a boy in the shop but cannot teach one the business in three years, and they are unwilling to serve more than that. *I* can see how a young man can learn to wipe a joint and receive technical instruction in the principles of the plumbing trade, and also learn how to do certain kinds of sheet-metal work by attending a trade school, but how he can get enough practical knowledge of the work necessary to succeed in a country cornice shop I fail to see. The tendency of the times is for each one to learn only one part of a trade and stick to that alone, but that won't work in a country shop. We are expected to do first class plumbing and fitting, and if a man wants a good and workmanlike job of hot-water work or a furnace job, we must do that to his satisfaction or lose a good customer; and if we happen to break the plaster or displace a few bricks, we must make it all right. It seems to us it will be necessary for the country shop to take the boys and teach them country work, and if any of the readers of *The Metal Worker* can tell us how to make things profitable to the boys, as well as ourselves, we would be greatly obliged.

Weekly Prize Competitions.

$25.00.

FOR MORE than six months Weekly Prize Competitions ($10) have been an interesting and useful feature of the *Pharmaceutical Record*, a journal issued from this office and devoted to the interests of the drug trade. These weekly competitions have related to a variety of technical and business questions of interest to druggists, and have brought out a large amount of information of much service to the readers of that enterprising journal. In view of the success of this feature we have decided to announce a similar series of Weekly Prize Competitions on questions of interest to our readers, and invite a general participation on the part of the trade. As the object of these competitions is to obtain information which will be of practical service to our readers, and to discuss questions in which they are interested, we shall esteem it a special favor if any in the trade will suggest subjects for such competitions, which, if deemed suitable, we shall take pleasure in using.

In each competition there will be three prizes—a first prize of $12.50, a second prize of $7.50 and a third prize of $5. The prizes will be awarded for the answers which in the judgment of the committee of award are most suitable for publication and of the most general interest. These competitions are open to every one, and it is hoped that there will be a general response from business men. Those intending to compete are reminded that it will not be necessary to write long essays, but that comparatively brief and business-like answers to the different questions will be favorably regarded as meeting the purpose for which these competitions are announced. We shall have the privilege of publishing any or all of the contributions received.

Weekly Prize Competition No. 2.

SUBJECT:

How to Keep the Store Neat and Clean.

This competition, which relates to a matter of no little practical importance in the conduct of business, is intended to call out an explanation of desirable methods, and touches upon such points as the following:

The advantages of keeping the store neat and clean;

Difficulties in doing this;

How to sweep and dust, with suggestions in regard to sprinkling, disposition of sweepings, &c.;

Clearing counters and ledge of accumulated stock;

How to avoid the accumulation of odd goods where they do not belong;

The care of show windows;

Methods of receiving and unpacking goods;

Care of goods awaiting arrival of invoice;

The disposition of goods to be called for.

The following prizes will be awarded:

First prize	$12.50
Second prize	7.50
Third prize	5.00

Replies are to be received not later than February 11, 1893. They should be addressed as follows:

DAVID WILLIAMS,
96–102 *Reade street,*
New York.
Weekly Prize Competition No. 2.

The Weekly Prize Competitions noted below are now before our readers and remain open until the dates named:

No. 1. Closing February 4.
How to Avoid the Accumulation of Dead Stock.

No. 2. Closing February 11.
How to Keep the Store Neat and Clean.

Another subject will be announced in our next issue.

Our readers are also reminded of the following Prize Competitions, announced on another page, in each of which four prizes, of $50, $25, $15 and $10, are awarded:

No. 6. Closing February 18.
How Retailers Can Best Advertise and Extend Their Business.

No. 7. Closing February 18.
Travelers' Yarns.

No. 8. Closing February 18.
How to Treat Clerks.

No. 9. Closing February 18.
Shop System of Keeping Track of Jobs.

No. 10. Closing February 18.
Business Maxims—At Least 10.

No. 11. Closing February 18.
How Small Retailers May Keep a Record of Prices.

PLUMBING AND GAS FITTING.

Testing Plumbing.

From D. M., *Watertown, N. Y.*—Will you kindly give us the method usually employed in testing old plumbing work to ascertain its condition and safety from sewer gas? There are some school building in this city in a suspicious condition and the Board of Health are thinking of ordering a thorough examination.

Answer.—The test usually employed to ascertain the condition of old plumbing work in this country is the peppermint test, although in some places, under certain circumstances, what is known as the smoke test is applied. This latter test, which consists of forcing heavily charged smoke through the pipes, requires an appliance specially adapted for the purpose, known as an "asphyxiator," but it is not generally available and the method consequently is not much in vogue, the peppermint test being accepted as the one most desirable and consequently most generally adopted. To secure the best results in its application it is necessary that the vertical soil and waste pipes should be open at or extend above the roof. In many localities these pipes do not extend above the highest fixture, but whether the plumbing system in use in Watertown has to contend with this serious drawback or not we are not informed. Supposing that the roof opening exists, in order to make the test it is necessary that two persons be engaged in the work—one to do the "roof act" and the other to exercise his olefactory nerves within the building.

The method is as follows: The man on the roof supplies himself with a pail of hot water, a bottle of oil of peppermint and some cloths to cover the mouth of the pipe. The scuttle or other openings to the roof and all the doors and windows opening to the outer air are to be closed so as to prevent any of the odor from the roof wafting into the building and vitiating the test, and the traps to all of the fixtures are to be left undisturbed during the application. The roof operator first pours some hot water into the soil or waste pipe opening, next he empties about 2 ounces of oil of peppermint into the pipe, next he pours in the remainder of the hot water, and then closes the mouth of the pipes with the cloths so as to prevent the escape of any of the pungent odor. The man inside is meanwhile awaiting developments, and when the peppermint begins to make itself felt, if the plumbing is in bad order, he will readily detect it and be able to locate the exact spot where the defect exists, by the odor emitted, as he goes from room to room. If there should be an open joint or a defective pipe through the house there will be no difficulty in finding it out, and the proper remedy can then be readily applied. It should be borne in mind that the peppermint odor may be present, although there may be no defect in the joints or the pipes, and if so it may be set down either to the fact that the traps have syphoned out for want of trap ventilation, or that the pipes are run with so little judgment as to create what is known in the sanitary world as "by-passes." If syphonage is proven to be the cause no time should be lost in venting the traps, and the same promptness is necessary where a defective arrangement of the pipes leads to the same result. It is well to add that if the soil and waste pipe do not open to the roof the peppermint for testing should be poured in at the highest fixture on the line of pipe, the door of the room in which such fixture is located to be kept closed during the operation.

Plumbing Regulations.

The preparations which are being made throughout the State to carry into practice the provisions of the act passed last year by the Legislature at Albany and signed by the Governor known as Chap. 620 of the Laws of 1892, in relation to the regulation of plumbing and the licensing of plumbers in the different cities, has developed a spirit of inquiry into the merits of the materials to be used and how to use them which is encouraging to the advocates of sanitary progress and good plumbing.

The questions cover a wide range in relation to plumbing work and its requirements. As is usual in such cases, there is in many instances a considerable amount of triviality, but in the main the desire to obtain serviceable information is readily discernible.

The soil, waste and cellar drain pipe system appear to be the thought which is uppermost in the heads of those who will be prime movers in the contemplated reform. The material to be used and the method of testing to be observed claim first attention, and we give a few brief points which should be sufficient for all practical purposes.

The plumbing code should provide the following in every case: The vertical lines of pipe—soil, waste and vent—should all extend above the roof and be open at top. What is known as extra heavy cast iron should be used invariably, and the pipes when set up should be tested either by means of air or water pressure—the former the most reliable, while the latter is the most satisfactory in many respects.

In no case should earthen pipe be used inside the walls of the building. It may be set outside for drainage purposes, and the connection with the iron cellar drain pipe be made with good Portland cement. The running trap and fresh air inlet should not be omitted in any case.

Rain water leaders should in no instance be used as soil pipes. If within the building they should be of cast iron with the joints well calked with oakum and lead. The cellar drain should be laid so as to secure a good descent of not less than ¼ inch to the foot.

These answers cover the extent of inquiries made and should suffice for all of our readers interested in the subject.

Why the Water Back Exploded.

From J. P. S., *Burlington, N. J.*—Inclosed you will please find clipping from a Philadelphia paper referring to a range explosion which took place here a few days ago. As the cause assigned does not seem to me to be a legitimate one, I would ask *The Metal Worker* to throw some light on what could have led to the accident, and how it could happen that the boiler became empty and red hot with the consequences as stated. How can such happenings be avoided?

Answer.—The account furnished by our correspondent states that "the explosion was due to water freezing in the supply pipe, causing the boiler to empty and to become red hot; and that when the water was released and rushed into the boiler the explosion ensued."

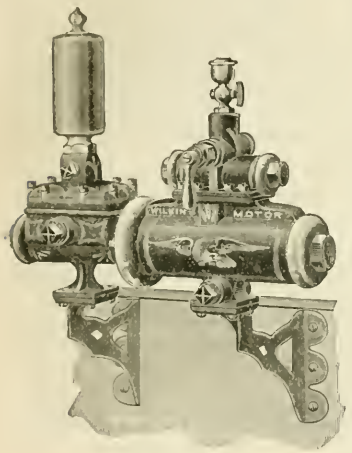
This is not correct. In the first place, the word "boiler" is erroneously substituted for "range water back," as understood in the trade; and in the second place, neither water back nor boiler could be emptied by the stoppage of the supply pipe. The cause of the bursting was the increased pressure to which the imprisoned water in the range water back became subject while waiting for the necessary pressure to force it into the boiler. It is to be supposed that the fire was allowed to run down and that the cold air during the night circulating through the kitchen and passing through the grate bars converted the water in the water back and in the supply pipe into ice. The first effect of the fire in the morning was to reduce the ice in the water back to water, which gradually became heated until it reached 212° F. Up to this (the boiling point) there was no actual danger, but when no circulation was possible because of the frozen supply pipe the longer the hot water was exposed to the heat the greater was the pressure in the water back, and it was only a question of time how long it would stand it. The collapse came when the pressure exceeded the resisting power of the water back. If the coupling of the hot-water circulating pipe with range had been unscrewed so as to permit the steam to escape and only a small fire kindled until the supply pipe had been thawed out and the circulation restored the accident would in all probability have been avoided.

As a preventive of range explosions nothing is so effective as a proper circulation. It is to the stoppage of circulation by frost that the Burlington accident may be attributed, and as other causes of stoppage are at times likely to occur, it is important that any tendency in that direc-

tion should have prompt attention. As conducive to that end it is considered advisable by practical men that in connecting the boiler and the water back the hot water or upper pipe should be somewhat larger than the cold water or lower pipe. By that means there is a better circulation secured than when, as in the majority of instances, both are of the same size.

The Wilkins Motor Pump.

The Columbus Closet Company, Columbus, Ohio, manufacture the Wilkins Motor Pump or Hydraulic Water Lifter, a general view of which is shown in the accompanying illustration. The motor is designed to pump rain water from a cistern into a tank in the upper part of a house for the purpose of supplying baths, wash stands, &c., with soft water. The pump is operated by means of hydraulic pressure, or, in other words, by water taken from the city main and using it instead of steam power. The motor is made in three sizes. Nor 1 is intended for pressures up to 40



The Wilkins Motor Pump.

pounds to the square inch and will pump 1 gallon while it wastes 1½ gallons and raises the water 2 feet for every pound of pressure on the driving cylinder when not below 40 pounds. Where the pressure is below this and not under 20 pounds to the square inch the No. 2 motor is used, which pumps 1 gallon while it wastes 2 gallons, and with 20 pounds of pressure will raise 1½ feet for every pound pressure on the driving cylinder. The No. 3 motor is used for pressures from 10 to 20 pounds and pumps 1 gallon while it wastes 3 gallons, and with 10 pounds pressure it will raise water 20 feet, with 15 pounds pressure 40 feet, and with 40 pounds pressure will, it is said, raise water to a hight of 250 feet. The motors are constructed entirely of bronze metal with no working parts exposed. In case of repair they can be easily taken apart, having right and left-hand connections. The manufacturers point out that there are no stuffing boxes to leak and no delicate piston rods or eccentrics or cross heads to get out of order.

HENRY BEUTELSPACHER, Bridgeport, Conn., has patented an improved soldering iron possessing several novel and interesting features. It is so made that the copper bit can be turned and held at any angle, making the iron convenient for use in many kinds of work. The means for setting and holding the bit are very simple. At the bottom of the bit is a notched disk pivoted in the split end of the handle rod and which permits the bit to swing at right angles to either side. To hold it in position there is a collar slipping loosely on the rod, which is arranged to catch the notches of the disk referred to and fastens with a bayonet joint, thus securely holding the bit in position.

Power of Examining and Supervising Boards of Plumbing.

From W. H. P., *Utica, N. Y.*—I would be glad to ask the advice of *The Metal Worker* relative to the proper interpretation of the law under which the Examining and Supervising Board of Plumbers and Plumbing in this city was created. In the matter of examination of candidates for the position of inspector, which will come up early in January, if six or eight candidates apply for the office and each pay the examination fee of $5 and then suppose each candidate to be above the average and that the Board of Health appoint one of the number, the others want to know if their individual $5 is coming back to them. I should be glad to have your opinion.

Answer.—From the synopsis of the act of 1892 before us it seems plain that the fee of $5 is not returnable to the unsuccessful candidates. They take the chance and enter the competitive list, paying their entrance fee to make them eligible for such chance. The section of the act applicable to their case clearly requires the board "to charge and collect from each person applying for examination the sum of $5 for each examination made by such board." There is no provision for the return of this fee in case the applicant is unsuccessful, and as the bill further provides that "all money so collected shall be paid over to the chamberlain or treasurer of such city," it appears to us that the question is settled and the board has no authority to make any return of the fees.

Dry Closets in New York.

From L. M. I., *Newburg, N. Y.*—Will *The Metal Worker* inform me if the State or local Board of Health allows the dry closet system to be placed in buildings in New York City?

Answer.—The State Board of Health has no jurisdiction within the limits of New York City and cannot authorize the use of any system of dry closet therein. The New York Board of Health exercises almost absolute power in the direction of sanitary matters within the city and county, and in the exercise of that power prescribes the class of plumbing and plumbing fixtures to be set up and which is that used in connection with water service. Every building in New York City facing on a sewered street must have water closets and all the facilities for the proper flushing thereof. There is a species of dry closet in use in some of the Central Park Buildings where there is no elaborate sewerage system, but whether it is of the Moule or the Smead-Willa pattern, or some makeshift, the work of the park carpenter, we are unable to state. The earth closet, however, is not in use in dwellings in New York City.

TRAPS AND VENTS.

WE ARE INDEBTED to John C. Kupferle, Second and Mound streets, St. Louis, Mo., for his No. 16 illustrated and descriptive catalogue and price list of brass and iron specialties. The catalogue contains the principal plumbing and waterworks specialties manufactured by the firm, as well as a line of such other goods as are used by the plumbing trade. Since issuing his last catalogue he has added lavatory, tank and sink brackets. He desires to call particular attention to the fact that his manufacturing capacity has been greatly increased, and he mentions that he will be able to serve his customers as promptly in the future as in the past. The volume, of convenient size, is bound in purple cloth boards, and contains 70 pages illustrating and describing a large variety of goods. The first portion is devoted to hydrants, street washers and fire hydrants of many different varieties and styles. Accompanying the illustrations are brief descriptions together with price-lists of the various sizes. Next comes an account of water closets, lawn sprinklers, valves, hopper cocks, seat legs, air vents, pipe hangers, boiler stands and such goods. A number of pages are given up to brackets for various purposes. Cesspools of different designs are noted. A variety of miscellaneous articles such as pump fixtures occupy the next few pages. At the close of the catalogue are repair lists. The publication is neatly gotten up and will be of value to all handling these classes of goods.

THE ST. JOSEPH PUMP COMPANY, St. Joseph, Mo., send us a pretty calendar directing attention to the Perfection water elevator and purifying pump of their manufacture. This apparatus, together with three infantile operators, occupies the upper part of the card. The picture is a process cut, and we presume is a living likeness of some of the most junior members of the company.

THE PITTSBURGH GAS & ELECTIC FIXTURE MFG. COMPANY of Pittsburgh were granted a charter last week, with a capital stock of $10,000. John M. Thompson, E. W. Mudge, David T. McKee and Robert B. Ivory are the directors.

SMITH & WEBSTER, manufacturers of fine plumbing goods, 193 Lake street, Chicago, furnish the plumbing material for the Bristol Building, Ashland, Wis. This is to be the finest building in the State north of Milwaukee, and will cost $100,000. P. J. Dullanty of Ashland does the plumbing work.

THE BOARD OF EDUCATION of Eau Claire, Wis., have adopted the Torrent Washout Range system of closets for the Eau Claire school buildings. The Torrent Washout Range is manufactured by the well-known manufacturers of plumbing goods, Smith & Webster, 193 Lake street, Chicago.

PERCY FALKINBURG, Atlantic Highlands, N. J., who is one of the Town Council, has at present some 75 plumbing contracts on hand, which is an evidence of the active state of business in that town. We understand that there are some 100 houses going up during the winter and spring, while the town is going to spend about $100,000 for water works and sewers, bids for which will be opened February 8.

WE HAVE RECEIVED from M. R. Wilson, Rome, N. Y., a neat little catalogue relating to his extensive line of manufactures, which includes copper-lined bathtubs of every description, copper range boilers, sinks and copper balls of all kinds, water-closet tanks and seats, pipe boards, bathtub casings, flush pipes, stand pipes, valves, ball cocks and a varied assortment of brass work. These goods in various styles and sizes are illustrated in the pam-

phlet before us, which is a little volume of 50 odd pages, bound in manila paper. In addition to the illustrations are tables of prices and brief descriptions of the articles are given when necessary. At the end is an index of articles. In the introductory note Mr. Wilson calls attention to his lately increased facilities which enable him to supply promptly all kinds of plumbers' copper cabinet ware and brass work.

SYDNOR & SHEPARD, Richmond, Va., are, we understand, meeting with a large demand for Rife's hydraulic engine or ram, which they manufacture. Referring to the capacity of this motor, they say that with 12 feet of fall and a good supply of water a large-size ram will deliver about $\frac{1}{20}$ of the water supplied it to a point not exceeding 120 feet vertical distance and to a horizontal distance of 1000 feet or more. At 50 feet elevation twice as much water will be discharged as at 100 feet, if the amount of water is the same. A special feature of the Rife ram to which the manufacturers allude is that pure spring water can be delivered at the house while the power is furnished by any creek or polluted stream. The double-acting engines or rams made by this company are the same as the single. With the double-acting attachments connected, the corresponding numbers or sizes are adapted to the same conditions of location except the power of creek or river water is utilized when the spring is insufficient.

ON ACCOUNT of the proportions that their commercial printing has attained, the Clayton & Lambert Mfg. Company, Ypsilanti, Mich., have found it necessary to establish a job printing office of their own, where they now do all their own work. They will soon issue a complete catalogue of their gasoline specialties, and each one of their large jobbers will receive for distribution quantities of these catalogues with his own advertisement on the front cover and a brief business sketch within. We understand that these catalogues will not be too large or heavy to inclose with business letters without extra postage and the Clayton & Lambert Mfg. Company hope soon to have them in the hands of every plumber, painter and electrician in the country. On February 1, Bert Lambert will start on his semi annual trip through the Middle and Eastern States in the interest of his firm.

S. DAVISON, who is agent for New York City and New York State for the goods manufactured by the Steel Bath Mfg. Company of Detroit, has established an office at 56 Beekman street, New York City. We understand that the introduction of the steel-clad bathtub has met with great success in this market.

JAMES B. CLOW & SON, Lake and Franklin streets, Chicago, report that considerable work yet remains to be done under their contract at the World's Fair. For this contract about 3000 water closets, 1500 lavatories and 1500 urinals are required. There are yet 1000 water closets, 500 lavatories and 500 urinals to be placed in position, which is to be done by April 1. While all of the plumbing work is to be first class in every respect, that in the Art Building is intended to be particularly fine. The toilet rooms are to be finished with the finest marble, tile floors, frescoed ceilings, &c. The Beckman embossed closets are to be used. The firm have a nicely furnished office in the Service Building on the grounds, which is now in use and will be during the World's Fair. The extensive advertising space in the closets, of which the firm has exclusive control, is being taken rapidly.

The Pacific Mail Company have issued an announcement at San Francisco that a permanent cut in rates of 50 per cent. will be made on all freight per steamer of the 18th inst. to Central American ports. This cut is brought about by the competition of the new Spanish-American line.

House Warming.—I.

There are few subjects relating to domestic economy of more vital importance than that of maintaining the temperature of our dwellings at the point requisite for health and comfort, and yet it will hardly be questioned that there is no branch of what may be termed "domestic engineering" in which the application of correct principles of known physical laws is more utterly ignored. The formulation of those laws and the demonstration of the correctness of the now universally accepted theories are due to the untiring and exhaustive researches of some of the most eminent scientists—men whose intellectual caliber was such that they were able to deduce and demonstrate facts from data so meager and apparently so irrelevant as to place them far beyond the comprehension of the average intellect and to gain the unbounded admiration of those who, while unable to successfully emulate, could still appreciate, the results of their labors.

And yet to many so-called "practical" men the word "science" is like a red rag to a bull. They do things according to accepted practice—not because they know it to be right, but that it is the way they were taught. On the other hand, we have a class of practical men who, while doing things as they have learned them from teaching or observation, are in sharp contrast with the former type, by reason of giving some thought to "why." Such men are the progressive ones and they are willing and anxious to learn, not only from their own observation and reasoning, but from that of others as well—and it is to them alone that all practical improvements in "applied science" are due.

APPLICATION OF SCIENTIFIC DISCOVERIES.

Every practical man, whether he be workman or superintendent—the latter being usually a development of the foreman—can decide for himself to which of these classes he belongs; if to the first, he will do well to change his allegiance as promptly as may be. With a few notable exceptions, the men by whom these scientific principles were evolved have limited their efforts to the demonstration, rather than extending them to the application of their discoveries; and upon the practical men the latter labor devolved—with what result may be seen in the wonderful progress of this era in all branches of engineering.

The reason for the limited advance in improvement of methods and facilities in connection with matters purely domestic may be found in the fact that, while in the aggregate they constitute a field of vast magnitude, the individual units composing this aggregate are on so small a scale as to be more or less neglected. To the rank and file of householders the lack of economy and efficiency of domestic appliances is not realized, as, from want of a technical understanding of the subject they compare what they have, not with what might be, but with what is, and their standard of comparison, therefore, is erroneous, from the fact that the logical result must be slow progress or none at all. Also, the possible saving in expense of each item, even though representing a large percentage, is comparatively small, if merely considered as an abstract matter of dollars and cents. Ten ones, however, make ten; and an aggregation of many small economies may make quite a large one. Therefore, as the cost of housekeeping is made up of sundry small "ones," the resultant ten, if reduced by a large percentage, would be very appreciable.

SAVING IN MONEY AND HEALTH.

But, even if we ignore this phase of the matter and consider merely the question of comparative efficiency, the importance of the subject suffers no diminution, as the comfort, health and, in fact, the very lives of the family are more or less dependent on all features bearing directly or indirectly on the sanitary condition of the dwelling. The proper heating and ventilating, no less than correct plumbing, may be considered as important factors in sanitation, and to the first we propose to direct a few inquiries with a view of comparing the results of ordinary practice with the theoretical and also the practical possibilities, as deduced from ordinary practice on a scale sufficiently large to be dignified by the term "engineering." The subject is one of many ramifications, on account of the many different systems of heating, and also that, from the interdependence of the two, the matter of ventilation must be considered jointly with that of heating.

In order to make the specific comparisons necessary in this connection, the use of numerous calculations will be unavoidable. The latter will, however, be kept strictly within the practical limit, and based upon simple and familiar formulæ, in which only the ordinary arithmetical rules are necessary. In such cases as a complete analysis of the details would render the work too voluminous the simple formulæ or quantities will be given, together with the name of the authority to whom they are attributed. On the subject of fuels, American data only will be used, except in relation to such as present the same characteristics in all localities. In regard to general principles and physical phenomena, being of a purely abstract nature, they are entirely independent of local influences. Before proceeding with the classification of heads referring to the several systems of heating, it will be well to briefly consider the subject in a general way and also, incidentally, call attention to its effect or dependence on the matter of ventilation.

(To be continued.)

On the Road.

At Cooley's, Springfield, Mass., one evening last week were noticed the following well-known men in the trade:

J. Sidney Smith of St. Louis Stamping Company, Boston, who would easily pass for the rector of a fashionable church.

E. B. Doolittle of Richardson & Boynton Company, New York, one of the greatest hustlers in the business.

E. B. Freeman of Steel Edge Stamping & Retinning Company, Boston, who is great at whist and thinks the Intelligent oil can a wonder.

J. S. Crapon of Dean Mfg. Company, Taunton, Mass., who is up in the latest styles of tinware.

And Edward C. Hazen of Kirkham & Hazen, Springfield, a live merchant and an enthusiast on football.

Genial Ben Mallory was missed, but his spirit hovered over the company and several of his latest yarns were sprung on the innocent *Metal Worker* man.

Authority has been given for the erection of a new pumping station near Washington Bridge for the supply of water to the upper part of New York, west side. The tower will be 175 feet high. Three large pumping engines will be set up, having a capacity of 20,000,000 gallons a day, and the tower of 4,000,000 gallons—total daily capacity 24,000,000 gallons. The entire estimated cost is $500,000.

TIN PLATES.

TIN PLATE.—V.

Sorting and Boxing.

Little need be said on this subject. The faults incident to the quality or the treatment of the steel from which the plates are made are readily identified in practice and can hardly be put into words. The plates—whether they have only two, or as much as four pounds of tin per box—should be free of streaks incurred in the black-plate rolling, or subsequently due to scruff in the tinning pot; there should be no bubbles, scratches or buckling, and no patches of half-coated surface. The various defective plates are sorted into their classes of "wasters," which should not under any circumstances exceed 7 per cent. of the whole. The value of ICW may be taken as 50 cents less than the value of IC per box.

The plates are boxed in elm boxes at 8 or 9 cents each with the aid of an ordinary screw clamp. Better methods will occur to all Americans. The boxes are then branded, and, for the information of those to whom the terms "Common No. 1," "Cross No. 1," "Common Doubles," "Two Cross Doubles," "Small Doubles," &c., are unfamiliar, the following list of dimensions and weights is given:

Brand mark.	Number of sheets in a box.	Sizes. Inches.	Weight. Cs. qrs. lb.
IC	112	20 x 28	2 2 0
IX	112	20 x 28	2 2 2
C	112	14 x 20	1 0 0
X	112	14 x 20	1 1 0
XX	112	14 x 20	1 1 21
XXX	112	14 x 20	1 2 14
XXXX	112	14 x 20	1 3 7
IC	225	183/4 x 10	1 0 21
2C	225	133/4 x 93/4	3 17
3C	225	123/4 x 91/2	3 7
IIC	225	133/4 x 10	1 0 7
IIx	225	133/4 x 10	1 1 0
1x	225	133/4 x 10	1 1 21
2x	225	133/4 x 93/4	1 0 14
3x	225	123/4 x 91/2	1 0 21
1xx	225	133/4 x 10	1 1 14
1xxx	225	133/4 x 10	1 2 7
1xxxx	225	133/4 x 10	1 3 21
D C	100	163/4 x 123/4	3 14
Dx	100	163/4 x 123/4	1 0 7
Dxx	100	163/4 x 123/4	1 1 0
Dxxx	100	163/4 x 123/4	1 2 21
Dxxxx	100	163/4 x 123/4	1 3 0
S D C	200	15 x 11	1 2 21
S Dx	200	15 x 11	1 2 14
S Dxx	200	15 x 11	1 3 7
S Dxxx	200	15 x 11	2 0 0
S Dxxxx	200	15 x 11	2 1 11
Wasted or WC and X mixed	225	133/4 x 10	1 0 0
T T	450	133/4 x 10	1 0 7
X T T	450	133/4 x 10	1 0 14

Cost of Plant.—The cost of the plant we have been considering will be as follows:

Four tin mills and two engines, so arranged that two more mills can be coupled at a future date	$20,028
Eight pairs cold rolls and engine	13,598
Two pickling machines, with cradles	1,728
Eight tinning sets, 28 x 20 and 20 x 14 (including royalties on patent) shutting and engines	8,500
Total	$50,754

The total weight of material in the above, exclusive of engines and tin sets, is 353 tons 14 hundred weight. Boilers, heating furnaces, loose plant, cost of erection, buildings, &c., are not included in this estimate.

Analysis and Tests.—A streak mark in a tin plate, if cut out in strips and treated for silica will often prove whether the default is due to the presence of sand or ganister in the tin bar maker's ingot, or to scale or faulty rolls in the black-plate mill. Continuous mechanical tests of the annealed black plate and of the finished plate are of course of vital importance.

The quantity of tin on a tin plate may be estimated in the following way: 5 grams of tin-plate chips are weighed into an 80 c. cm. bulb flask provided with a cork, into which passes a tube and Bunsen valve, add 53 c. cm. of 5 E hydrochloric acid and dissolve. The object of dissolving out of contact with the air is to prevent precipitation of a large amount of sulphur by subsequent treatment with SH_2 if the iron were present as protochloride. Pour the solution into a 300 c. cm. beaker, dilute to 250 c. cm., add 13 c. cm. of 10 E hydrochloric acid, saturate with SH_2, allow it to stand in a warm place for half an hour, filter off the Sn S and wash with SH_2 water. Dissolve the Sn S off the paper with 12 c. cm. of hot 2 E Na_2 S in which 0.1 gram of sulphur is previously dissolved by frequent percolation, and repeat with 12 c. cm. more. The solutions are now mixed and diluted to 100 c. cm., neutralized with 10 E Hcl, and after settling the stannic sulphide is filtered off and treated to separate any arsenic that may be present; the tin is determined as oxide.

Present Condition of the Trade in Great Britain.—Surprising as it may seem, there are still a large number of manufacturers and traders in Wales who will not believe that tin plates can be and are made in the United States, and even the better informed do not grasp that the output there is already at the rate of 100,000,000 pounds per annum or 16 times the make of the first quarter of the year. On the other hand, it is not a fact that the Welsh trade is so severely hit as some of our American friends suppose. For the first nine months of the following years the quantity of tin plates exported to the United States was:

	Tons.
1890, January 1 to September 30	227,114
1891, January 1 to September 30	284,316
1892, January 1 to September 30	214,527

From January 1 to September 30, 1892, the United States, as against this, produced 10,981 tons of finished plates. The exports of this country are not, therefore, seriously suffering as yet, though threatened by the enormous increase of the trade so successfully established in the United States.

All the smaller and some important works in this country have been stopped for many months, and we believe there are at the present moment a total of 112 mills idle, while many others are working in only a desultory fashion. This great depression must be attributed chiefly to over production, the many mills that were run up during the year preceding July, 1891, having been the climax of a power of production that was already excessive. And we now recognize that the manufacture, at least of commons and ternes, for export to the United States has passed from this country forever, or is about to do so, tariff or no tariff. It is not generally expected that any large change in this tariff will be made in the face of a powerful established trade, or that the big steel makers, having found a new outlet for their produce, will let it slip from their hands.

At least three English syndicates who have been awaiting the result of the election for some months have now definitely abandoned any idea of erecting plants in the States. A manufacturer who visited several sites, in preparation of a scheme by which he proposed to export and coat his own black plate in that country, makes the following interesting but rather exaggerated estimate of the cost of doing so—interesting, because the cost of imported as compared with home-manufactured black plate will be apparent to the reader.

Cost of Coating Imported Black Plate, Ternes Reduced to 14 x 20.

	Per ton.	Per box.
Black plate, 1 ton, f.o.b.	$40.34	
Duty, 2,240 pounds at 1.85/100 cents	36.96	
Freight	1.92	
Delivery charges to works	2.10	
	$81.32 =	$3.87
	Per box.	
Lead, 2½ pounds; tin, 1 pound; 3½ pounds at 12 cents	$0.420	
Coal (at $2.88)	.032	
Vitriol, 2½ pounds at 1½ cents	.037	
Palm oil, 1 pound at 6 cents	.060	
Flux, 2 pounds at 2 cents	.040	
Box	.190	
Stores	.075	
	$0.754	
Credit: Dross, metal and copperas	.011 =	.74
Labor (American Association):		
Pickling	$0.05	
Tinman	.12	
Boy	.04	
Cleaning and dusting	.02	
Assorting	.06	
Carrying, extra labor, &c.	.05	
Boxing	.02	
Day wages.—Foreman $5.00		
Smith and striker 3.75		
Mechanic 2.25		
Engineers and firemen 8.50 =	.15	.51
Commission to agent, 1¼ per cent. on $5.40		.08
Rent, rates and taxes		.03
Interest on outlay		.04
General charges and management expenses		.07
Total		$5.34

It is well known that labor is one of the most difficult questions in the South Wales trade. The following resolutions were passed by the Tin Platers' Executive on November 26 last, and may be taken as illustrative of the policy the workmen pursue and of their general ignorance of affairs in America and elsewhere:

1. This executive, viewing the unpatriotic conduct of Messrs. Morewood & Co. in assisting Americans to deprive Wales of its staple trade, and observing that black plates are exported to be coated in America with a view of misleading the American public that they are producers of tin plate, and that in this way South Wales works and Cwmbwrla millmen are used as instruments to the injury of their own tinhousemen, calls upon the Cwmbwrla and South Wales millmen to protest against being

made instruments for such purpose, and are prepared to approve of their action if they present their employers with a general notice.

2. That the executive ask the branches to prepare themselves with a view of taking action to prevent the exportation of black plate.

In conclusion, whatever other difficulties may occur in the progress of the industry in the United States it is to be hoped that the Workman's Association will not hamper and limit the productive power of first rate mills of efficient and costly tinning machines, or of any of the numerous inventions by which the employer effects economies and extends his operations. In Wales, however much the employer may be pressed by his shippers, however desirous of floating his standing charges in a larger output, however low his profit or heavy his loss, the Union permits only 36 boxes. The most rapid and efficient tinning pot is on the same footing as the oldest—36 boxes. As much as anything else, it is this difficulty that has induced certain Welsh manufacturers to take advantage of the provisions of the McKinley act, and to leave the staple industry of Wales babbling astonishment at the want of patriotism and long suffering displayed. But whatever number of manufacturers transfer their capital, it matters little. The day was bound to come when America could manufacture its own iron, or rails or tin plates. That day has most certainly come, and again it matters little whether the tin plates are manufactured by an American or by a Welshman provided they be made in Ohio or Pennsylvania. There will still be room for gallant little Wales elsewhere.

The Blower System of Heating and Ventilation.

BY WALTER B. SNOW.

The blower or hot blast system of heating and ventilation is substantially a product of the last decade. Ten years ago the system and its advantages were but little known. True, there was a limited number of hospitals, theatres and halls in which fans had been introduced for mechanical ventilation, but as a rule only as adjuncts to an already established system of heating and frequently almost independent of it, as in cases of vacuum ventilation.

Practically, however, no marked advance had been made toward the introduction of a system by which heated air was forced under pressure through ducts and distributed as a heating medium throughout a building.

The public was uninformed and public opinion was therefore not settled as to the advantages of the method; perhaps to a great degree due to the fact that no one concern was advocating the system as a system and manufacturing for general sale fans and heaters in combination and properly designed for this work.

FIRST USE OF THE HOT BLAST.

Such marketable combinations were in fact first employed for the purpose of drying lumber, wool, cotton and like materials. Their success in this line led, naturally, to their introduction for heating purposes alone.

To say the public is fully alive to the necessity of proper ventilation, and the laws of some States, vigorously enforced by State inspectors, require either a stated air supply per person in certain classes of buildings or else in a confessedly indefinite manner require that the air in these buildings shall not be allowed to become so impure as to be injurious to health.

Thus the State of Massachusetts in the acts of 1887, chapter 173 and acts of 1888, chapter 149, relating to the ventilation of factories, workshops, public buildings and schoolhouses, provides that they "shall be ventilated in such a proper manner that the air shall not become so exhausted as to become injurious to the health of the persons" present or employed therein. Just what degree of purity is to be maintained under this law is an open question, as demonstrated by the experiences of the State inspectors in their enforcement of the law.

In the passage of the new building laws of the City of Boston a laudable attempt to clear this matter of its indefiniteness has seemingly proved abortive by what appears to be an omission in the text. Chapter 419, section 105, of Massachusetts, acts of 1892, reads: "Every hall, auditorium or room of every building hereafter erected for or converted to use as a schoolhouse, factory, theater or place of public assembly or entertainment shall have in continuous operation while occupied a system of ventilation so contrived as to provide 50 cubic feet per minute of outer air for each light other than an electric light for each occupant." Apparently, the last clause should read, for each light other than an electric light and for each occupant.

Accepting this as the intended reading, it is certain that under all conditions of weather this volume can only be supplied by mechanical means. The fan blower is universally accepted as the most economical mechanical agent. The ease with which 50 cubic feet per occupant can be satisfactorily and comfortably supplied must necessarily vary with the room space per occupant. It is not a question of possible fan capacity, but of comfortable distribution of the air after it enters the room.

AIR SPACE AND VENTILATION.

In an ordinary factory with its usual number of occupants, there is generally about 300 cubic feet of space and upward per occupant. Under such conditions there is no great difficulty in distributing 50 cubic feet per minute per occupant; that is, supplying a volume capable of changing the entire volume of the room every six minutes.

In a crowded hall, however, with from 75 to 100 cubic feet of space per occupant, a supply of 50 cubic feet per minute per head must cause a change of the air every one and a half to two minutes, a practical impossibility, without creating objectionable drafts.

The fault lies not with the air supply required, but with the exceedingly small room space per occupant. The law can only be made practicable by coupling with it regulations as to the amount of space to be allowed each occupant of the room or building.

The writer's attention has just been directed to a case where a committee had been chosen for the purpose of improving the ventilation of a certain hall capable of seating 3000 persons. The present provisions for air supply consist of two floor registers (there is reasonable opening at the ceiling for the escape of vitiated air, which should be admitted pure and fresh at some other point). The air connection to one of these floor registers was found to be 4 x 24 inches, the other was not measured, but was presumably of the same size. To go from one extreme to the other, the chairman of this committee persists that he now wants to supply by means of a fan 60 cubic feet of air per minute to each occupant.

The volume of the air space in the hall is, however, so meagre that this air supply will be equivalent to changing the entire volume of the hall every two minutes. At such a velocity as would be permissible, if it were possible to satisfactorily admit this volume under these conditions, there would be required about 1000 square feet of free air inlet directly to the room against 1 square foot at present in the register connections.

At the present time accepted systems in new school houses, in and about Boston, prior to the passage of the last building laws, provide 30 cubic feet of air per minute per occupant, and as each occupant is generously provided with 250 cubic feet of room space a change of air takes place every eight and one-third minutes—a result readily accomplished by the blower system. Effective mill heating, with properly proportioned apparatus, is accomplished with the blower system by changing the air about once in 15 minutes.

ADVANTAGES OF BLOWERS.

As a heating system alone the blower system has certainly a logical reason for its existence. All systems of direct radiation depend to a large degree upon a circulation of heated air for their efficient action. This is noticeably true in the case of mill heating by overhead direct steam pipes, where the currents are set up by the passage of air past the pipes to the outer walls, thence downward by their cooling action and across the floor to rise again and be reheated by another passage across the pipes. A circulation of air is a necessity in an efficient heating system.

In the blower system this circulation is made positive; the air is discharged into the rooms under such velocity as to cause it to flow to the desired points. All of the air is conveniently and economically heated by a single heater in connection with the fan.

The permissible velocity of air in ducts and through outlets to rooms is largely dependent upon the character of the building. In a factory—particularly one with a smooth ceiling offering no obstruction to its flow—the air may be made to do effective heating at a distance of 200 feet or more from the outlet, with velocity through the same of 2500 to 3000 feet per minute.

In a schoolhouse, on the other hand, register velocities are usually below 500 feet per minute, and in the case of halls or theaters, with air supply through the floor, even this velocity must be greatly reduced—due to the fact that a velocity of over 19 feet per second is perceptible to the sense of feeling.

The blower system is applied solely as a plenum system — that is, supplying air under pressure and maintaining a pressure within the heated building. Its action as a ventilating system is thereby rendered practically independent of atmospheric conditions and positive action is secured at all times.

(To be concluded.)

More ocean vessels are to be built for the lakes. Captain Gilbert, the manager of Harrison H. Wheeler's shipyard at Bay City, Mich., is in Pittsburgh, to purchase steel beams and other structural work to be used in the construction of three large steel steamships to be turned out of the Wheeler yards during the coming year. These three steamers will be of the freight-carrying class, and will approach the ocean steamers. The three new ships will be 400 feet in length. They will have a beam of 42½ feet and 27 feet depth of hold. The average tonnage of the largest lake vessels at present is 3000 tons; these new steel vessels will have a carrying capacity of 3800 tons each. They are expected to maintain an average speed of 14 miles per hour.

Nearly five-sixths of all the corporations formed in Mexico for the prosecution of various enterprises requiring an investment of capital are American. Only three years ago Englishmen had the lead. Last year the capital represented by new companies was over $90,000,000.

STOVE TRADE NOTES.

A Test of Heating Apparatus.

The past few winters have been so unusually mild in the Northwest that the various forms of heating apparatus have not for some time been severely tested. Last week, however, there was a visitation of rude Boreas with considerable of his old time vigor, and it is not too much to say that he caught hosts of people illy prepared for his reception. Numerous have been the complaints from those who fondly supposed that, because they were very comfortable with the temperature at 20° above, they were ready to endure zero to 20° below. Stove men were suddenly called upon to supply more stoves for heating exposed rooms; furnacemen were obliged to unwillingly listen to complaints from customers who had never been known to complain before, and who insisted that hitherto approved forms of construction were out of gear somewhere or they would not fail to deliver the usual volume of heated air; the serenity of users of hot water was disturbed by the suddenly discovered fact that hot-water heaters consumed coal quite rapidly in extremely cold weather, and a manufacturer of steam heating apparatus was covered with confusion when he found the steam pipes in his own office frozen one bitter morning. If we were not deterred by compassion for an unfortunate fellow creature we would like to present a picture of one office of a prominent stove manufacturer recently visited, which was found heated by a gas stove, an oil stove and a furnace supposed to be somewhere below, but which gave no sign of its proximity through the capacious register in the floor. The mild suggestion that a coal stove and a steam or hot-water boiler would aid in raising the temperature of the room evolved a considerable degree of heat immediately, demonstrating quite conclusively that, after all, internal physical conditions have much to do in exciting warmth in the individual, without special regard to mere mechanical appliances for heat development.

Changed Conditions in the Stove Trade.—III.

By Stovemaker.

Next to the furniture-store element of disturbance to the even tenor of the stove business comes the matter of repairs, the piracy of which is of earlier origin than 1882, but the growth and development belonging to the period of great change under discussion. The traffic in repairs by the so-called pirates has eaten like a cancer into the vitals of the trade of the wholesalers until it has almost destroyed that particular branch or department. It was ignored entirely at first as of little account; in fact, there were for a long time but one or two such concerns in the city, and the manufacturers felt it would be uncharitable to attempt to deprive them of a living from the traffic when it affected any one of them so little.

After a while, more and more frequently, the dealers called at the regular houses for light castings and odd plates, after purchasing from the pirates, for the same stove, grates and other heavy castings which they had with them, and the manufacturers, more from chagrin than from the loss of trade really experienced, consulted legal counsel to find out how to proceed to close them out. Their chagrin was not lessened to find that, however it might be criticised on high moral grounds, the business of the pirates was legal, and before they could be held amenable the manufacturers would have to patent the design of every part of their stoves, or else by legislative enactment declare the piracy of repair patterns unlawful.

Both of these remedies were entirely too expensive to think of, and agitation of the matter was dropped. It is a mooted question after all whether the trade in pirated repairs, which is not prohibited by law, is not also perfectly honorable and fair. Less odium attaches to it nowadays than in former years, and the repair dealers themselves show less consciousness of the fact that their trade was frowned upon by manufacturers and some stove dealers. Of course there are many persons who would avoid any business that had to be conducted to a certain extent on the sly, as this has been. For instance, when some orders have made it necessary to purchase odd pieces of the manufacturers or when they have had to get pieces for new stoves introduced by the manufacturers to "file up." At such times they have been obliged to resort to sly means to get what they wanted, knowing the manufacturers would refuse them if they ordered in person or on their own name, but such practices are not very unlike the methods adopted by manufacturers to get a competitor's stove which they desire to imitate, or hardly less questionable than the subterfuges employed to get inside information of a rival's business or points regarding his constructions.

Relations of the Pirate to the Trade.

The pirates have always been looked upon as bitter enemies of the stove wholesalers and regarded with unconcealed contempt. The enterprise displayed by the repair men was not calculated to mollify this feeling in the slightest and it kept increasing in proportion as the repair men's business increased and the wholesalers' declined. Their close contact and relations with the stove dealers put them in possession of information about new goods introduced for which repairs should be made, and kept them abreast of the times and with complete stocks for the accommodation of all.

The main reason why they were patronized in preference to the stove makers was, of course, the lower price at which they sold repairs. The better class of retailers for a long time refrained from trading with them on account of the better fit of original repairs, but were gradually driven to do so and get the benefit of the reduced price to hold their own trade against the competition of smaller concerns, basement traders and second-hand men, who did and were able to undersell them. But other agents were also instrumental in helping the growth of the repair business among the pirates—namely, the expressman, city and suburban, who, receiving orders from several customers for a variety of repairs from several of the different wholesalers and jobbers, found it very convenient and advantageous to make all their purchases in one store instead of visiting all the makers or regular agents, and any manufacturer who from a lack of system of keeping repair accounts was unable to realize the falling off in his repair trade needed only to look in the express wagons as they backed up to his door for stoves to be convinced, for there he would see the evidence in packages of repairs for his own stoves just from the repair shop. It may be remarked that sometimes an unprincipled expressman would buy repairs at the repair shops at the reduced price and charge the dealers for whom he bought the manufacturer's price, keeping the difference himself, the deception being discovered when, on account of some mistake in size, the dealer brought back the grate or bricks to the stove manufacturer, only to be informed that they never came from his place.

It seems incredible that the manufacturers were so blind to their own interests as to let this trade, an important item, be taken from them when for several years it was within their power to suppress the traffic by reducing the price of repairs so low that the pirates would be unable to make any money. Putting the price at cost for two years would have forced them all out of business, and the loss to the manufacturers would have been a bagatelle compared with all the losses of the years since, to say nothing of the future. They have been forced to make reductions from time to time anyhow during the past ten years, to hold fast to some lingering trade and stem the tide as much as possible, but the opportunity for crushing the competition and reclaiming the business has gone by. Instead of weaklings at first, they have powerful rivals to fight, men strengthened in purse by the accumulations of profits for ten years, and more securely intrenched behind a business whose scope has been vastly enlarged since its birth.

The craze for the artistic decoration of stoves has benefited them, and so has the demand (so liberally met) for dustless stove polishes and plastic cements; and the trade in tile, nickel and bronze ornaments, stove paste, polishes, to say nothing of the other sundries, such as finishing rings, chimney caps, drip pans, &c., &c., yields a comfortable income to some regardless of stove brick and castings.

All this trade might have dropped into the laps of the stove men if they had nipped the competition in the bud.

Stock Orders for Repairs.

In 1882, when the stove salesman booked a winter stock order for stoves from the retail dealer, he likewise received a stock order for repairs, consisting of grates, bricks, rests, fire pots, &c., by the dozens, for all the stoves, new and old, of his firm's manufacture. They were delivered with the stoves; they amounted to as much as 10 or 12 stoves and yielded a profit twice as large. In place of every hundred such orders in 1882 they get one now—the repair men get the rest. They do get a complimentary order now and then for an oven front or check slide for old stoves, for which a pattern has to be hunted up and the piece cast, and on which the profit very seldom is "in it." At any rate, the main trade from the stove dealers consists of orders for pieces that the pirates

do not keep, oven and fire doors, oven tops and bottoms, ends, backs and bottoms of ranges and the light parts of heating stoves, pieces so seldom called for compared to heavy castings that it does not pay them to make patterns for or cast them. Even this trade the manufacturers are prevented from making any money on, as any advance in price of such pieces would drive the pirates to making them at once. The only other trade left to the manufacturers is from such people out of town, more or less remote from a city, who write to the stove makers, not knowing of the existence of the other shops, the number of whom, however, grows less and less as the repair men reach them by circulars and price books and persistent advertising.

(To be continued.)

The Modern Stove.

A writer in one of the Albany papers gives play to his imagination regarding the stove of to-day in the following effusion:

The modern stove is most fearfully and wonderfully made. It is the sum and consummation of American inventive genius. From a simple type it has been evoluted and developed into a wonderful piece of mechanism with dampers, drafts and check drafts, flues and return flues, cold and hot air chambers, and contrivances and contraptions innumerable and unnamable, all of which seem useful and easy enough to manage, when the dealer is expatiating upon the merits of the stove and you are undecided whether you will purchase a "Vesuvius," with a nun-draped goddess rising from its crater, or a "Popocatapetl," surmounted by a silver statue as chastely draped as Ada Rehan's counterfeit presentment in Montana silver.

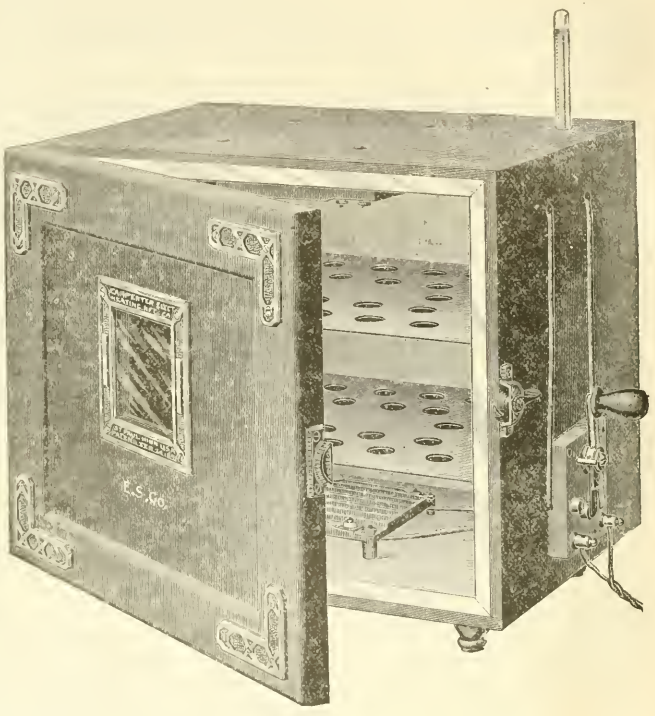
No matter which stove you buy, you are certain to wish in less than a week that you had chosen the other. You find the multiplicity of direct, back action and double back action drafts simply bewildering. You open and shut them, experiment with them in all sorts of ways and you find that when you adjust them so that the fire burns you get no heat, and when you adjust them so that you think you will get some heat the fire goes out more quickly than the enthusiasm of a defeated party after an election. You go back to the outlaw from whom you purchased the machine; he explains the mysteries of its mechanism to you again, and back you go to wrestle with it again, but you find yourself more hopelessly baffled by its intricacies than before. You have to own, after weeks of physical and mental efforts, that you are beaten. You know that you can keep a tavern better than its landlord; you know that you can run a paper better than its editor, and you have a sneaking notion that you can write a better sermon than your pastor; but you can't run that goddess crowned nickel-plated imp of blackness. You wonder whether you had better engage an engineer to take charge of the pesky thing, but while you are debating whether you can afford this the stove is apt to manifest some new and unsuspected peculiarity, and you conclude that the engineer has not yet been born who can master its waywardness, and you surrender to it, are the slave of its freaks and moods, its eccentricities and waywardnesses, until the thing burns itself out, or you purchase deliverance by investing the savings of years in a furnace or steam heating apparatus.

"I know whereof I speak" when I pay this tribute to the supremacy of matter, as embodied in the modern stove, over mind.

There is one of them in the *Argus* office, a gorgeous nickel-plated, tile decorated affair, with a bronze statue dancing a hornpipe on its crest, that is a terror, a nuisance and a calamity all in one. To see that stove in summer you would think it was perfect, that it could not only heat a room in winter, but devote some of its surplus energy to setting type or writing editorials. You would have a very different opinion of it, however, if it alternately roasted and froze you on a cold and windy day.

The responsibilities attending the care of that stove are too great to be entrusted to the devil, so the past devil has been appointed to fill its always empty maw with coal, manipulate its drafts and counter drafts, oils its bearings, pack its boxings and coax and pet it in the hope of getting 1 per cent. of the heat out of the coal which it consumes. Our past devil is "no slouch," but he is no match for that stove. It's the bane of his existence and makes him long for the happy days when he was only a devil and used to go to the other offices on fool's errands, for a yard of editorial, italic quoins and left-handed mallets. It's the simple truth that this boy has had to build fires in that stove no less than six times in one day. He thinks he has everything fixed all right and goes off as happy as a boy can be with such a terrible responsibility resting upon him, but in less than an hour the stove will have taken a new kink, direct drafts will be acting as check drafts, or check drafts will reverse action and become direct drafts and send a whole cylinder full of coal blazing up the chimney in a few minutes. Then again the stove will set up in business as a gas retort and send enough poisonous vapors out into the room to kill any man who hadn't become used to inhaling coal gas. It's a wonderful stove and it's aging our past devil very rapidly.

It's a curious fact that, although every one who has made the acquaintance of that stove recognizes it as a wonderful piece of mechanism, every man about the office thinks he knows more about manipulating its machinery than any one else. I used to think that I knew something about it myself, but it knocked the conceit all out of me long ago. The political editor, the city editor, the horse editor, the man who did the snake stories when snakes were in season and who now writes up "Hymeneals," "Notes of Sunday Services" and other light and airy trifles, and the occasional, who brings in a "personal" now and then, each and all cherish the delusion that they know how to run that stove. Of course they don't, but it's worth being roasted and frozen and choked with gas to see them assisting, directing and counseling with the engineer as to the proper method of adjusting the apparatus. And it gives me increased respect for their nerve to note the cool assurance with which they shuffle off responsibility for their failures on the boy, charging to his stupidity, carelessness or cussedness their inability to achieve the impossible and regulate a stove which cannot be regulated.



Cooking and Heating by Electricity.—Fig. 1.—View of Baking Oven with Door Partially Open.

John F. Donohoe of Paola, Kan., has recently patented a radiator intended for use in connection with an oil, vapor or gas stove. The radiator is referred to as being simple, durable and inexpensive, and as so constructed as to prevent all possibility of the outer air becoming mixed with and contaminated by the odors or other offensive products of combustion of the fuel. The device is said to be attractive in appearance and capable of application to a great variety of heaters and burners.

Cooking and Heating by Electricity.

For some little time past no little attention has been given to the question of the application of electricity for heating and cooking purposes, and as a result a number of devices have been forthcoming. Electricians have known for many years that heat could be obtained from this source, but the problem was how to safely and economically adapt it to the purpose. A satisfactory solution of the problem is believed to have been found in what is known as the Carpenter Process, controlled by the Carpenter Electric Heating Mfg. Company of St. Paul, Minn. This concern has brought out a number of appliances for heating and cooking purposes, some of which are illustrated in the accompanying engravings. Among the more important of these may be mentioned the baking oven Fig. 1, which is 18 inches long, 14 inches high and 12 inches deep, made of well seasoned white pine. It is lined with asbestos felt, which is covered with bright tin plate, allowing no radiation of heat into the room. There are two resistance plates on the bottom and one on the top of the oven connected with a switch on the outside so that two temperatures may be obtained and so that the operator may have heat at the top or the bottom of the oven, or at both places, as may be desired. Two foot iron shelves are provided, while in the top is a small glass window so that baking operations may be watched from the outside. The manufacturers state that each resistance plate consumes about 5 ampères on 110 volts, and that it requires only from 12 to 15 minutes at the maximum temperature to heat the oven to 250° F. Then the current can be turned off and the baking continued. The manufacturers state that after hours of baking and roasting the oven can be carried about from place to place without danger of burning the hands; that the oven door never needs to be opened, and that no basting is required. The construction of the baking oven is such that when the switch is placed on the right-hand post the bottom plates become heated, when on both posts the top and bottom plates become heated, and when on the left-hand post the top plate alone is heated.

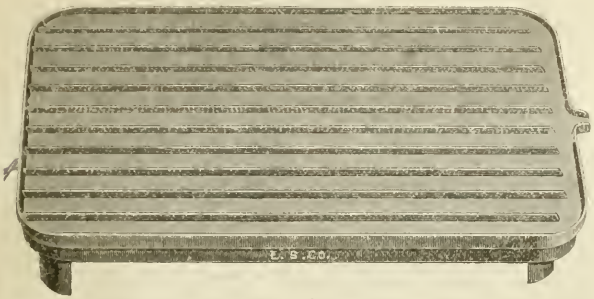


Fig. 2.—General View of Broiler and Toaster.

Another appliance which the company are making is a broiler and toaster illustrated in Fig. 2 of the engravings. Three sizes are made, measuring, respectively, 7 x 11 inches, 10 x 16 inches and 15 x 30 inches. The sizes for general use are the first and second, these being made with ridges on the surface, as indicated in the cut. The small size consumes about 7 ampères on 110 volts, and from a cold iron, after turning on the switch, will become sufficiently heated in from three to four minutes, so that broiling can be completed in less than five minutes. The broilers are constructed with a little slant, so that they may drain to one point at the middle of the lower end. The largest size of the broiler is intended for restaurant and hotel use. Pancake griddles are made in sections for general use, each section measuring about 6½ inches in diameter. The size intended for restaurants and hotels measures 12 x 18 inches and has a smooth polished surface. These are so constructed that any number can be placed side by side, thus obtaining as much surface as may be required.

Fig. 3.—House and Office Radiator.

In Fig. 3 of the illustrations is shown a general view of a house and office radiator made 18 inches long, 13 inches wide and 12 inches high. It is constructed with three separate heating plates, placed upright and incased in a nickel-plated frame provided with an improved spring switch, so that one, two, three or all of the plates may be turned on at the same time by pulling out the knobs at the end of the radiator. They will remain in this position until pushed in, when the plates will be disconnected, thus giving perfect control over the temperature. The company also make this radiator for use on a 500 volt circuit, constructed with four upright heating plates and connected in series with an improved spring switch which will break very quickly.

In the skillets, tea kettles, coffee pots and numerous other convenient cooking utensils which the company manufacture, there is said to be only one-eighth of an inch of metal between the food which is being cooked and the heated wire. This is accomplished by completely covering the bottom underneath the utensil with a zigzag wire and imbedding it in enamel of such quality as will expand and contract with the varying temperature of the wire without cracking. Cooking may be done, it is stated, on any ordinary table in any room in the house. The company are also making electric pressing irons of all kinds, which are kept at a uniform heat while in operation. The manufacturers make the broad claims of economy, durability, speed and cleanliness, and state that the apparatus can be used on any electric light wire which may be in the house. A factory has been started at St. Paul, Minn., for the manufacture of these electric heating and cooking devices and the company are now giving employment to over 60 men and turning out 27 different articles.

ODD PLATES.

Wm. E. Devlin, representing the Excelsior Mfg. Company, St. Louis, Mo., in Alabama, Georgia and Florida, resigned from this company on January 1. The employees of the establishment presented him with a diamond scarf pin and a pair of diamond cuff buttons. Robert E. Ryan, store salesman, made the presentation speech, which was very favorably commented upon, and in which he referred to the fact that Mr. Devlin had been connected with the company for over 20 years. The occasion was a very pleasant one to all concerned.

Henry Gleason, 106 Beekman street, New York, is sending out a neat vest-pocket memorandum book, 4¼ x 2¾ inches, bound in red leather, with his compliments, calling attention to stove urns and figures, made by the New Jersey Lamp & Bronze Works, and stove tiles in over 800 original designs made by the Trent Tile Company, for both of which concerns he is agent.

The Safety Oil Stove Company of Boston, Mass., are the assignees of a patent lately granted to Charles K. Stinson, Chelsea, Mass., for an oil stove. The peculiar feature of this stove is a wick-raising device located within the tank and having a depending flange cast solid with the top of the tank against which the wick bears. The chimneys are flattened, having edgewise openings, closed by a movable door with transparent panes, so that the light from within may be transmitted to the room in which the stove is used.

J. Van Wormer & Co. of Albany, N. Y., are distributing a four-page folder, the covers of which are lithographed in colors, relating to their Astral B range made in four sizes. It has triplex, duplex or flat grate, as the trade may desire, improved water front, patent oven-door opener, cut off damper and other

features of convenience and utility. The ornamentation is neat and effective, nickel being judiciously employed. The folder shows a view of the stove and gives directions for operating it.

Eugene Munsell & Co., 218 Water street, New York, have recently issued an export edition of their illustrated catalogue, containing in all 142 pages, 8¼ x 5½ inches in size and finely printed. In the front has been incorporated a description of their Manhattan line of stoves, ranges and furnaces, printed in both the Spanish and Portuguese languages, which will be of much practical use in the West Indies, Mexico, Central and South America, as also the numerous other sections of the globe where these languages are spoken. Reference is made to the illustrations of the different articles on the various pages of the main catalogue, and there is also given a price-list of the numerous goods dealt in by this house. The four features—viz., Spanish and Portuguese description, price list and main book are all bound in one cover. Among the goods described in this work are double oven ranges, ranges for flats and general use, cook, parlor, cylinder, globe, cannon, laundry and gas stoves, furnaces, fire-place heaters, mica, hollow ware and sundries.

George Baker, a well-known stove man of Albany, died at his residence, 70 South Pearl street, at 2 o'clock on the afternoon of Tuesday, January 3. Mr. Baker was identified with the stove business in Albany for nearly 40 years. He was born in Charlton, Saratoga County, N. Y., 63 years ago. In 1854 he went to Albany and worked in the stove store of his brother James. Five years later he opened a store of his own on Washington avenue, where he remained for two years, then going to the corner of Norton and Green streets, and after a short period removing to the present location of his business, 16 Green street.

William J. H. Gluck of Baltimore, Md., is distributing a variety of advertising matter relating to some of his leading specialties, among which is the Gluck non-explosive oil stove No. 2, referred to as being "as safe as a lamp and as effective as a large cook stove." Only one size is made, this having 4-inch wicks. The list also includes slips showing the May Queen, the Gluck elbow and the Naylor patent ice cream disher.

J. H. Cort, dealer in cooking and heating stoves, ranges, hot-air furnaces, &c., has issued an illustrated catalogue of 119 pages, 7½ x 5 inches, well printed on fine heavy paper. There is a large variety of ranges, with single or double oven, cooking stoves, caboose ranges, parlor and cylinder stoves, furnaces, laundry and cast-iron heating stoves. There are stoves for export, suited for all sections of the globe. Distributed through the book at intervals are blank pages for memoranda, which will be found convenient when making notes for future refereuce. The Stamford brick-set range with low closet is alluded to by this house as having met with much favor since its introduction last fall. Since January 1, 1893, and hereafter, this house will be known as J. H. Cort & Son, Warren L. Cort having been admitted as a partner.

A unique advertising novelty in the shape of a *fac-simile* of a United States mail bag, except that the edges or sides are not fastened, reaches us from the Barstow Stove Company of Providence, R. I. Upon one side of the bag is written the address of the person to whom sent, while upon the other side is the inscription, "Let No Man Delay the United States Mail." This inscription is printed in two lines between which is a panel carrying a 1-cent stamp. Upon unfastening the bag we find some advertising matter relative to the company's goods. The statement is made that "there has been no day during the past year when the United States mail has not transported to us orders for Bay State ranges, stoves and furnaces. As the new year opens we desire to thank our many patrons for their favors of the past season, not forgetting to thank 'Uncle Sam' for his prompt delivery of them. At the same time we beg to request that we be not forgotten in the new year just opening."

Simonds Mfg. Company, 50 Cliff street, New York, are just introducing Culver's T portable elliptic furnace, with patent jointless indirect radiator. This furnace is similar in construction to one which heretofore they have only supplied in brick set form. Owing to the necessity of its being properly set to give satisfactory results they have only sold the brick-set style to nearby trade, where it could be put up by their own workmen. They have now succeeded in adapting it to the portable form, and offer it for sale anywhere. They describe its features as follows—viz.: Owing to its peculiar shape it contains more radiating surface than many furnaces, and is made exclusively of the best cast iron, having but few joints. Its sections are put together with dry sand only, making it proof against breaking by contraction or expansion. It has a large air chamber which prevents the air from becoming overheated, thus preserving the castings. There is a large ash pit and triangular grate, and when desired it can be supplied with a draw-center grate. The pot is sectional, but it can be furnished with a solid one if so ordered. The sheet-iron casing is double, by which the cellar is kept comparatively cool. There are two well fitted trench plates to prevent the escape of air before it is heated. It is supplied with a patent damper, of direct or indirect pattern, operated at pleasure. The furnace has a clean out and water door, and is said to be gas and dust tight. Cold air may be admitted in the rear, sides or bottom. A clinker door is provided through which to remove clinkers and examine the fire. It is made in three sizes.

The Scranton Stove Works of Scranton, Pa., report a very gratifying volume of business for the year 1892, and state that in extent it was the largest in their history. Their foundry was idle only seven days including Christmas and New Year's.

Eugene Munsell & Co. of 218 Water street, New York, have issued an illustrated four-page circular of the Peerless Manhattan range made with or without horizontal boiler, and either brick-set or portable form. It shows, also, the Manhattan range with gas attachment, which is furnished with either portable or brick-set ranges.

The Art Stove Company of Detroit, Mich., have added to their already extensive line a new and attractive six-hole range which will be pushed during the season of 1893. The construction embodies many features which cannot fail to interest the wide-awake dealer and should establish for the stove a hearty reception. We understand the company have also perfected and introduced to the trade two new oil heaters, which are confidently expected to bring large returns.

The Central Oilgas Stove Company are distributing a New Year's greeting and with it an invitation to the trade to keep an eye out for an annual catalogue containing 100 pages, devoted to a description and illustrations of their full and complete lines of oil, gas and vaporizing stoves, together with their furnishings, which the company expect to mail about February 1. In a little folder which the company have issued are presented a number of facts relating to their goods which cannot fail to interest the trade. There is also presented a view of the company's oilgas lamp stove, which is 15 inches high and 10 inches wide at the base. The top grate is 10 inches square and has two drop shelves 4 inches wide, thus making the top of the stove with shelves extended 18 inches in width. One of the features of construction to which the manufacturers refer is their improved full-size vapor burner. The stove weighs 18 pounds and three are packed in a crate. The circular states that this stove is sent on application to any responsible dealer on ten days' trial and approval.

Broomell, Schmidt & Company, Limited, York, Pa., inform us that they are having a very excellent trade in their Heatancook range, which apparatus, they say, has gone through the severe test of the present season with excellent results.

We are indebted to the Fuller & Warren Company, Troy, N. Y., for a 16 page pamphlet which is being distributed to the trade. Its pages relate to the company's leading ranges, which are fitted with their triple series of interchangeable grates. The illustrations show the F. & W. Company P. P. Stewart range, the F. & W. Company Germania range, the F. & W. Company Diamond range and the F. & W. Company 16 hole range, all provided with the patent oval fire box, oscillating draw center triangular or dockash grates, as may be preferred. Sectional views are presented showing the company's new dockash grate, with patent oval fire box, as arranged in this series of constructions; also their triangular grate and the methods of removing them from the stove. The pamphlet is neatly printed in two colors, and will prove an interestingad dition to the stove literature of the dealer.

The Michigan Stove Company favor us with a sample of a new indoor sign which they are now furnishing to their patrons. It is the trade-mark of the company ingeniously pressed on a thin wooden board, which is inclosed in a neat frame. The whole is varnished in natural wood color, forming a unique and attractive sign to be displayed in a store.

The Somerset Stove Foundry Company of Somerset, Mass., closed their works on Saturday, January 10, in order to make repairs and take account of stock. We understand that operations were resumed during the past week.

The issue of the Atlanta *Herald* for January 10 contains an item to the effect that the plant of the Georgia Stove & Range Company of that city was sold on the day named to C. W. Hunnicutt for $24,304.86.

The Fuller-Warren Company of Milwaukee, Wis., made a very brief stop for the holidays and started up on January 2 again in all departments. Preparations are being pressed with vigor for the coming season. The policy of this company is to carry as little stock as possible from one year to another, but to be able to place fresh goods on the market each season. Last year their stock was so well cleaned up that even the sample room was invaded for sizes and styles in particularly strong demand. The company's new works were laid out on a very liberal scale and were expected to fully meet the requirements of their trade for at least a few years, but the end of the very first year finds the capacity taxed and some departments cramped for room. The furnaces manufactured here have been in heavy demand the past season and formed an important item in the company's trade. All the work is done for the Fuller & Warren Heating & Ventilating Company, whose system is steadily growing in favor for schoolhouses and public institutions requiring effecient and power-

ful heating apparatus. Col. Walter P. Warren, of Troy, N. Y., president of the company, visited Milwaukee last week and spent several days in going over the results of the year's business and conferring with Vice President and General Manager H. A. Viets relative to the coming campaign.

THE BAIN MFG. COMPANY of Charlestown, Ill., send us a number of sheets illtrating some of their leading specialties, among which may be mentioned the Prize Monarch, a medium-priced four-hole range intended for burning wood and furnished with the modern improvements; the Active Monarch, a four-hole construction having large draw hearth, swing feed, heavy cut linings, patent oven door opener, &c.; the Social Monarch, for wood only, made in a variety of sizes; the Regal Monarch, made for burning soft coal or wood; the Active Oak, a medium-priced heater for coal or wood, made in several sizes, and the Monarch Oak, adapted for hard or soft coal or wood. The company are producing a fine line of stoves and are pushing their trade in all directions. They will be represented during the ensuing year by J. E. Schroyer, who will travel in Indiana, George W. Rosebraugh, who will cover Illinois, and A. F. Alvey, who will look after their interests in Ohio and Pennsylvania.

AT THE ANNUAL MEETING of the Kernan Furnace Company held in Utica, Monday, January 9, the following officers were elected: President, Francis Kernan; vice-president, W. J. Owens; secretary, W. H. Landers; treasurer, Joseph F. Kernan.

SAM. UTTER and his son, John, have returned to New York after an absence of two weeks. During their absence Mr. Utter visited his agencies in the principal cities of the West, where he found everything satisfactory.

AN OIL BURNER having great radiating power forms the basis of a patent lately granted to E. M. Spalding and George E. Willsie of Fremont, Neb. The reservoir has a central flanged opening, within which is an outer wick tube having a flanged collar. There is also an inside stationary wick tube having its upper end crimped and provided with a series of inwardly extending circumferential grooves which are connected by ducts or flues. Within the inner wick tube is a button having a fluted neck, while upon the outer wick tube is an adjustable perforated collar and a cylindrical sleeve. Inverted T-shaped hot air pipes lead from without through the combustion chamber to the upper heating chamber.

THE THACHER FURNACE COMPANY, 33 Peck Slip, New York, report that last year's demand for their furnaces and ranges was far ahead of any previous year and that this year has begun with very flattering prospects. The company have made important additions to their works to meet the increasing demand for their goods.

RUMOR HAS IT that W. H. Mackellar, superintendent of the Mackellar Foundry Facing and Supply Company, Quincy, Ill., has severed his connection with that concern. We are personally informed by Mr. Mackellar that he is still connected with the company as in the past, and has no intention of making any change. We take pleasure in referring to this, as the success of the company in question is to a certain extent due to the efforts of Mr. Mackellar.

"THIS IS ONE OF OUR DRUMMERS," is the title of a circular which reaches us from the Empire Stove Works of Troy, N. Y. The title is printed in large red letters, below which in black is the following:

Do not chuck him in your waste basket! He is a modest solicitor, making no boiler shop whisperings; taking little of your valuable time, and no expense to you. He is always on the road, never sleeps, and gets there every time. He will attend to his own business, and not misrepresent other people and their goods. He will simply say that he is the only drummer we employ, and his expenses being only 2 cents a trip (Uncle Sam's Line,) we were enabled to sell our goods at such low prices in 1892 on account of our small expenses, that our trade was very much increased. We will transact business on the same line this year, for we are confident that our customers know a good thing when they see it. Do not forget us and we will remember you.

THE GOBEILLE PATTERN COMPANY of Cleveland, Ohio, have issued an official-looking document, under date of January 14, in which they make a bold offer for the purpose of proving their position as to the amount of business done during the year just brought to a close. The plan which they have hit upon is a challenge to any three pattern shops to contest, on conditions which are set forth in detail, the statement that in the year 1892 the Gobeille Pattern Company "did more business in the manufacture of wooden patterns for castings, as shown in hours on the pay roll, than any three other public pattern shops in the United States combined." The idea is to have each party to the transaction within 30 days from date sign a contract and deposit $1000 with the National Bank of Commerce of Cleveland. Three men shall be selected, who will examine the necessary books of account and decide the question at issue. A feature of the contest is that $1000 of the amount shall be divided equally among three charitable institutions in Cleveland.

AS A HOLIDAY REMINDER G. C. Dunklee & Co., stove dealers, 111-113 Blackstone street, Boston, sent out a handsome card in colors, one side of which shows a group of children, while the reverse is occupied by a seasonable bit of verse.

WE ARE INDEBTED to the Magee Furnace Company, Boston, Mass., for an attractive calendar for the year 1893. It consists of four pieces of cardboard, each measuring 5¼ x 6¾ inches, held together at the top by a red silken cord, forming a loop for hanging it upon the wall. Each card is embellished with a panel picture, there being one for each of the four seasons. The first card contains a calendar for January, February and March, the second one for April, May and June, the third covers July, August and September, while the last covers the remaining three months of the year. The picture upon the first card is entitled "Good Morning," that upon the second "A Song Without Words," the third is embellished with "A Vermont Hillside," while the last represents an interior, where a New England family is "Preparing for Thanksgiving." The back of each card carries advertising matter relative to the specialties of the company, reference being made to the Royal Standard square stove, the Magee Boston heater and the double-oven Kitchener brick-set range.

THE ROCK ISLAND STOVE COMPANY, Rock Island, Ill., issue a greeting to their friends in the trade, in which the statement is made that they have closed the most prosperous year of their experience. They have sold more Riverside stoves than ever before and have been able to fill their orders more promptly. They state that they are expecting great things from 1893 and have prepared for them. With the greeting is a card from A. D. Sperry addressed to his friends in the trade, and the opening paragraph of which reads as follows: "It has been said that 'a man must keep his mouth open a long time before a roast pigeon will fly in.' I believe that, but hope you won't have to wait so long for me to call on you with the old reliable Riversides. If you have them for your leading stoves it is a much better thing than a roast pigeon anyway, for the bird might not be properly cooked unless his folks used a Riverside, while our famous line is always just right."

George W. Percy.

The stove and hardware trade of the country, especially of the Eastern section, will regret to learn of the death of George W. Percy, which occurred at his home, 845 River street, Troy, N. Y., on the afternoon of Wednesday, January 11. He was one of the oldest residents of the city, and for some time past had been in feeble health. Recently he contracted a cold which developed into pneumonia, and, complicated with heart trouble, caused his death. He was born November 7, 1820, at Hoosick, where he spent his early life. While still a young man he removed to Troy, where he has since resided. After several business ventures he formed a copartnership with John E. Gately, and built up a large and constantly growing business in the manufacture of the stove trimmings which are to-day so well known to the trade under the name of Alaska. Owing to ill health, he retired from active business about a year ago. Previous to his association with Mr. Gately he for many years was connected with the hardware house of Taylor & Ackley, and for more than 20 years was confidential clerk for H. & W. Ingram.

Traveling Salesmen for 1893.

The Peninsular Stove Company of Detroit, Mich., have a staff of traveling salesmen for the new year which will cover a wide territory. Those representing the home office include E. P. Washburne, who will travel in New York and the Eastern States; F. R. Lawrence, in Eastern Ohio and Pennsylvania; Ernest Neuhoff, in Western Ohio; E. W. Frazer, in Indiana; R. W. Balleutine, in Nothern Michigan; J. B. Rue, in Southern Michigan; A. H. Lovejoy, in Kentucky, Tennessee and the South, while F. T. Dwyer will look after the trade in Detroit and suburbs.

The staff representing the Chicago branch of the Peninsular Stove Company includes J. A. McLaughlin, who will cover the northern portion of the city; E. C. Hanrahan, the southern portion of Chicago; W. T. Whiffen, the northern portion of Illinois; William Willing, who will travel in Southern Illinois; T. T. Crandell, in Wisconsin; W. L. Nesbitt, in Minnesota; William Bishof, Jr., in Northern Iowa and Northern Nebraska; Carl Raben, in Southern Iowa and Southern Nebraska; George A. Loy, in Kansas, and F. W. Isherwood in Washington, Oregon and the Northwest.

The Bucks Stove & Range Company of St. Louis, Mo., will be represented by the following salesmen, who will travel in the territory named: H. Maffray, in Illinois; C. H. Hodges, in Minnesota; G. D. Boller, in Northern Iowa; P. A. Pamplin, in Southern Iowa; F. A. Spielman, in North Missouri; F. G. Blackwell, in South Missouri; A. H. Gauff, in Kansas; E. F. Sprague, in Nebraska; W. E. Davlin, in Arkansas, Alabama, Mississippi, Georgia and Tennessee; Joe Hayes, in Northern Texas; D. W. Shanks, in Southern Texas, and Frank Selinger, in city of St. Louis.

E. Bement & Sons of Lansing, Mich., will have on the road during the year 1893 George P. Dailey, Charles T. Williams and D. H. Chisholm, who will cover the State of Michigan; C. A. Gooddale, who will travel in Ohio; J. C. Freme, in Indiana; J. G. Reilly, in Illinois; W. H. Newbrough, in Wisconsin; Linus G. Mollitor, in Minnesota; J. A. Hosmer, in Eastern and Central Iowa; O. Landes, in

PRIZE COMPETITIONS.

WE HEREBY ANNOUNCE a series of six prize competitions relating to trade matters in which our readers are interested. Four prizes of $50, $25, $15 and $10 will be awarded in each competition.

The competitions are open to all and a general participation on the part of the trade is invited.

We shall have the privilege of publishing any or all of the contributions received.

The committee of award in assigning prizes will take into account the merit of the different contributions and their suitability for publication.

PRIZE COMPETITION No. 6.

How Retailers Can Best Advertise and Extend Their Business.

The object of this competition is to obtain practical suggestions as to the methods which the retail dealer in Hardware, Stoves, Tinware, &c., can advantageously adopt in building up his business, and is intended to cover such points as the following:

Advertising in the local papers, with suggestions as to how such advertising should be done and to what extent;
The manner in which circulars and other printed matter may be used;
A description of any special or unusual methods of attracting and holding trade; and
General suggestions in regard to ways in which the business can be extended.

An account of any methods which have been found useful in building up trade will be suitable under this competition.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 6.

PRIZE COMPETITION No. 7.

Travelers' Yarns.

The traveling salesman is proverbially happy in the stories which he narrates, and this competition is for the purpose of calling out a collection of good yarns for publication. While the attention of travelers is specially invited to this competition, it is open to all. Stories relating more or less closely to trade or business matters will be preferred.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams 96–102 Reade street, New York, and marked Prize Competition No. 7.

PRIZE COMPETITION No. 8.

How to Treat Clerks.

Under this competition, beside a general discussion of the subject, such questions as the following may be considered:

The extent to which clerks should be given an opportunity of obtaining a knowledge of the business, and of price-lists, prices, &c.;
Whether it is desirable to have formal rules for the regulation of employees and for the management of the store. If so, a set of rules should be submitted;
To what extent clerks should be held responsible for their mistakes;
Suggestions as to how clerks should be treated in order to secure their most intelligent and efficient work;
Mistakes made in the treatment of clerks.

This competition opens an important subject and it is hoped that it will be discussed fully by merchants and by their clerks from their different points of view.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 8.

PRIZE COMPETITION No. 9.

Shop System of Keeping Track of Jobs.

This competition is intended to call out information in regard to methods of keeping account of the cost of labor and material on tin-shop work, repairing and new work, inside and outside. In connection with the general subject such points as the following may be touched upon:

Whether blanks or forms are used in connection with such work. (If so, samples should be submitted);
What record is kept of orders, costs of jobs, charges, &c.;
How time occupied in going to and from the job is covered;
Suggestions in regard to the profitable conduct of the shop.

To illustrate the system it is desirable that a specific job (as for example, repairing down spouting and eave trough, or other job of repairing in which new material is used) be referred to and the method of keeping track of the costs in such job fully explained.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 9.

PRIZE COMPETITION No. 10.

Business Maxims—At Least 10.

Those entering this competition will send at least ten maxims relating to the conduct of business, presenting in a brief and pithy manner practical suggestions which may advantageously be followed.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 10.

PRIZE COMPETITION No. 11.

How Small Retailers May Keep a Record of Prices.

The object of this competition is to call out information or suggestions in regard to the best methods to be adopted in keeping a record of prices, showing cost or selling prices, or both cost and selling prices, of Hardware, Stoves, Tinware, &c., in a small retail store employing not more than four persons in the selling and bookkeeping departments, including the proprietors. Those entering the competition are expected to give a concise and clear explanation of their system, and if a price book is used, to submit as illustrating the system at least three specimen pages. If a price book is referred to it may be of any design or arrangement best adapted to the purpose, and may be original with the contributor or may be one of the different price books on the market. Fictitious names should be used instead of the real names of jobbers and manufacturers.

The committee in awarding prizes will take into account the merit of the different systems described, the character of the descriptions given, and the general utility and interest of the contribution.

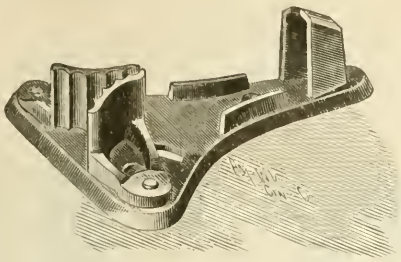
First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business, February 18, 1893.

Contributions should be addressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 11.

Universal Clamp or Double Eccentric Lath Holder.

The accompanying illustration displays the Universal clamp or double eccentric lath holder, manufactured by the Honeybrook Novelty Works, Lancaster, Pa. In using the holder one end of the lath is thrust through the jaws into the socket. The socket of the holder is so constructed that it will readily adapt itself to any thickness or width of lath, no matter how hard or smooth the lath may be or what amount of force may be required, the lath cannot be pulled from its position. The makers claim that it will enable the tobacco farmer to do his work at a less expense, and prevent the breaking and tearing of choice tobacco; that it is simple in construction; that the effective manner in which it holds the lath and the easy manner of adjusting it to the table or bench commends it to the farmer.

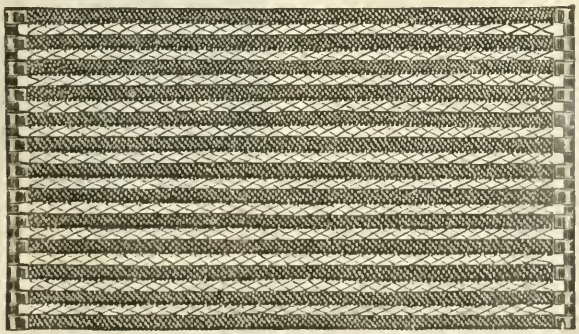


Universal Clamp or Double Eccentric Lath Holder.

New Midgley Wire Matting.

The accompanying illustration shows the new Midgley wire matting, manufactured by the Trenton Iron Company, Trenton, N. J. The mats are made of galvanized steel wire, the edges being finished with rubber strips, securely attached by interlocking metal strips. The manufacturers claim that they are the only wire and rubber mats so constructed that they can be rolled up or that will conform themselves to stairs and remain in shape with no fastening other than being tacked to the floor; also, they are the only wire mats into which may be woven ornamental letters as a sign. They can also be provided with rubber shoe cleaners, on which the edges of shoes may be thoroughly cleaned, thus avoiding the carrying of dirt or mud indoors. The manufacturers also recommend them for railroad passenger cars, Pullman cars and street railway cars; for this purpose it is desirable for them to be in two pieces for each car, so that they can be easily handled. In this form it is perfectly easy and safe to roll them up, throw them on the platform or ground, turn water on them and wash them and put them back in the cars. Mats can be lettered, when so desired, with brass or nickel letters.

The standard sizes are 16 x 24, 18 x 30 22 x 36, 26 x 48, 30 x 48, 36 x 48, 36 x 60, 36 x 72. Irregular shapes, special sizes and extra heavy mats made to order. These goods are also made in brass wire.



New Midgley Wire Matting.

The latest novelty in the labor world is a scheme to boycott the passenger whaleback, built at West Superior for the World's Fair, because the vessel is built of steel plates from the West Superior Iron & Steel Company, which is a non-union shop.

Stanley's Improved Plane Irons.

What is referred to by the makers as a substantial improvement in the production of plane irons has recently been introduced by the Stanley Rule & Level Company of New Britain, Conn. The construction of the plane iron is said to be such as to render it unnecessary to detach the cap iron at any time, for the reason that the connecting screw will slide back to the extreme end of the slot in the plane iron without danger of falling out. The screw may then be tightened by means of the thumb and finger, the screw head being properly milled for the purpose. The cap iron will then serve as a convenient rest or handle in whetting or sharpening the cutting edge of the plane iron. In the accompanying illustrations the construction of these plane irons is so clearly indicated as to call for very little description. Fig. 1 represents a plane iron with the cap screw fastened just back of the circular opening in the slot and in position for using the iron. Fig. 2 shows the cap screw moved to the rear end of the slot and in position for sharpening the iron without the necessity of removing the cap.

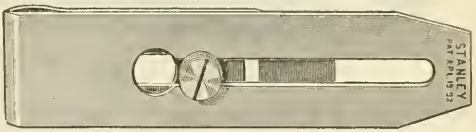


Fig. 1.—Showing Cap Screw in position for using the Iron.

Fig. 2.—Cap Screw in position for Sharpening the Iron without the necessity of removing the Cap.

The manufacturers state that by placing the circular enlargement of the slot nearest the cutting edge the plane iron can be safely tempered up to or beyond the lower edge of the circle, thus insuring equal expansion and contraction of the metal. The owner can also use up his cutter closer than heretofore without the liability of its being broken or cracked at this point.

National Post-Hole Digger.

The accompanying cut of post-hole digger represents the latest efforts of Gibbs Mfg. Company, Canton, Ohio, in this line. The blades and shanks are dropped out of single pieces of steel, properly tempered, thus doing away with malleable-iron

National Post Hole Digger.

shanks and rivets. A feature of the tool is the resting of the handles on the shoulders, bringing the thrust on the blades instead of on the bolts, which, it is claimed, prevents the handles from splitting. The point is made that the handles are separate and easily grasped, and the material and finish are guaranteed the best.

The Lawrence Coasting Guard.

The accompanying illustrations of a coasting guard illustrate the improved

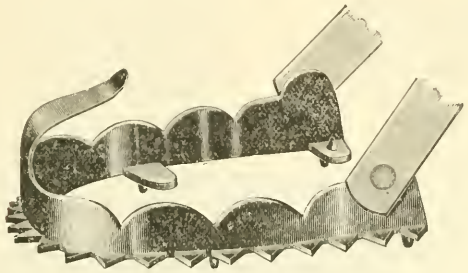

Fig. 1.—The Lawrence Coasting Guard.

form in which it is offered by the Copeland Hardware Mfg. Company, Worcester, Mass. Fig. 1 shows the device, which is intended to protect the boots and shoes when coasting. It also serves as a brake and steerer when running into danger, as a sled can be readily stopped by pressing the toe into the snow or ice. It is easily

Fig. 2.—The Manner of Attaching the Coasting Guard.

adjusted to the foot, Fig. 2, being made of malleable iron it can be spread or closed to fit a broad or narrow shoe or boot. The point is made that it gives the coaster perfect control over the sled.

Always Cool Sad-Iron Holder.

J. L. Keaner & Co., Chicago, Ill., are manufacturing the above article, which is

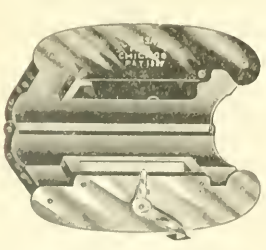

Fig. 1.—Always Cool Sad-Iron Holder.

illustrated herewith. This holder will fit any regular sad iron or polishing irons of any make, excepting Mrs. Potts' irons. The holder is lined with asbestos which prevents the conduct of heat. All radiation of heat from the iron upward against the hand is prevented by an extra heavy nickel-plated brass shield, which fits closely. In operating the holder, the right hand is placed over the top, with thumb at catch. The catch is then pressed, opening the holder. In adjusting the holder it is placed over the iron so as to fit the iron handle. Both parts of the holder are then pressed together, and it is ready for use. The rapidity with which this is accomplished is alluded to by the manufacturers, together with the safety, con-

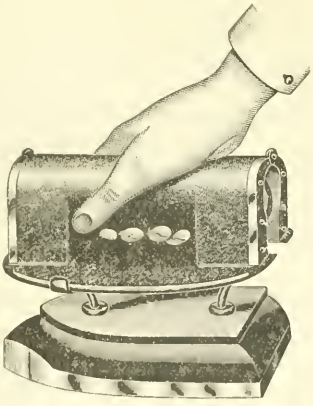

Fig. 2.—Holder in Use.

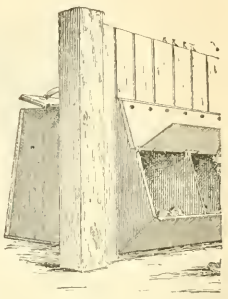
venience, simplicity, durability and cheapness of the holder.

Combined Garbage and Ash Box.

T. E. Copelin, 35 and 37 North State street, Chicago, is introducing the combined garbage and ash box, as illustrated herewith. It is made of heavy galvanized steel, and will be found very convenient where stationary receptacles are used. The box does not absorb moisture, and thus become a menace to health, as is liable to be the case when wood is used. Being set in, and fastened to the fence, it is out of the way of passing teams, and not liable to be moved from its position or stolen. An opening of suitable size having been made in the fence, the box is secured in position by means of flanges, which are riveted to the box and fastened to the fence by means of screws or bolts. On the alley side a close-fitting hinged cover is provided, which can be opened by the garbage collector when the contents of the box are to be removed. Under this cover are a number of holes, thus securing ventilation. The hinged cover on yard side is convenient to raise when any refuse is to be placed in the box, which is divided into two parts by a partition, thus securing separate compartments for garbage and

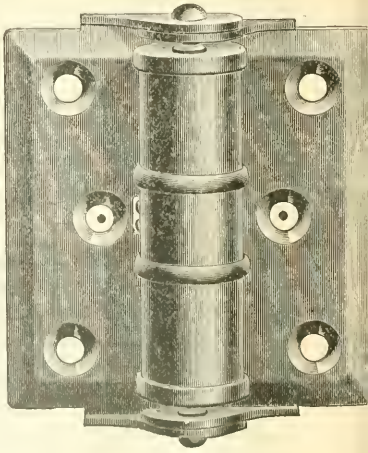


Combined Garbage and Ash Box.

ashes. The usual size of box made is 40 inches long, 25 inches high and 26 inches wide.

New Idea Spring Hinge.

The New Idea steel spring hinge is being offered by the Stover Mfg. Company, Freeport, Ill., makers of the cast hinge bearing the same name. It is referred to as being a well balanced and neat design, and as a covered steel spring hinge embracing lasting with correct working qualities. It is made in one size only, 3 x 3 inches for screen doors, and ordinarily finished in japan, but on special order will be furnished in electro, nickel and copper,



New Idea Steel Spring Hinge.

Berlin bronzed, bronze plate, oxidized copper and brass, packed for the best trade.

Austin Corbin proposes to build an elevated railroad on Atlantic avenue, Brooklyn, so that the surface roads may be used exclusively for freight.

The last rail of the Great Northern Railway has been laid, completing the route from St. Paul to Seattle and forming another transcontinental railway.

TRADE REPORT.

The Iron Market.

The Pig Iron market continues quiet and without special change since our last report. From some of the Western Pig Iron markets come reports which indicate growing activity, accompanied, however, by intimations that it has been secured through concessions to buyers. The local Chicago furnaces have set the pace in that market, and have placed very considerable quantities of Iron, the concessions, however, being in relatively small amounts. The Southern furnaces are reluctantly meeting the competition, but are not notably lowering prices where their influence is dominant. There has been a more active trade in Cincinnati, and Detroit, too, notes a livelier movement.

In Eastern markets sellers are more stubborn, and Philadelphia, notably, records a firmer feeling.

New York quotations are as follows: Northern brands at $14.75 @ $15.25 for No. 1; $14 @ $14.50 for No. 2; tidewater. Southern Iron, same delivery, $14 75 @ $15 for No. 1; $13.75 @ $14 for No. 2 and No. 1 Soft; $13.25 @ $13.50 for No. 2 Soft.

At Philadelphia the late severe weather has retarded business, more especially in outside operations, but as a matter of fact work is accumulating which later will result in much activity. There is much inquiry for quotations and considerable trade could be effected provided sellers would concede to buyers pretty much their own terms. Offers are at figures which sellers will not meet, resulting in transactions of only moderate proportions, but such business as has been done has been effected at about the same figures as have ruled during the past two or three weeks. The encouraging feature in the situation is the certainty of a large demand later on, which is looked on as likely to stiffen prices. In the meantime manufacturers assert that they cannot get out whole at the low prices frequently quoted, necessitating more money for their goods or a cessation of their business. Without doubt something is meant by these statements under prevailing conditions. Cost of production has been minimized until an end has been reached, and the future seems to indicate better prices or decreased output. The latter alternative is not likely to develop except perhaps where worn-out or unfavorably located plants are involved, as material will be needed in a few weeks' time. However, the ensuing three or four weeks is what those interested wish to provide for. The future has much of encouragement, but a plain statement of facts will not allow us to say that figures are any better than they were a week ago, but there is more resistance to anything that contemplates any further concessions. Quotations are about as follows for Philadelphia deliveries:

American Scotch, No. 1X.....	$17.00	@ $17.25
American Scotch, No. 2X.....	16.00	@ 16.25

The conditions governing the Pig Iron trade at Pittsburgh continue unchanged. Since the beginning of the current year inquiries are somewhat better, but actual business is confined to important lots. It is a fact that prices on all kinds of raw material are considerably lower than ever before, but despite this condition buyers manifest supreme indifference and continue to supply their immediate wants only, believing that when necessary to go into the market again they can supply their wants on as good or better terms than before. For some time past this hand-to-mouth policy has proved a wise and profitable one; but will it continue so? While there are no indications just now of a betterment in prices in the immediate future, it has happened before and may occur again that the long looked for turn will come unannounced. It is conceded to be a good business maxim to buy when a price about represents the cost of production. Prices may be fairly quoted as follows:

No. 1 Foundry	14.00 @	14.10. cash.
No. 2 Foundry	12.00 @	13.10. "
Charcoal Foundry No. 1....	19.00 @	20.00. "
Charcoal Foundry No. 2 ..	18.50 @	19.00. "

Reports from Chicago indicate that the market is in a more active condition, so far as Pig Iron is concerned, some values having receded somewhat, the general tone being decidedly bearish. The past week witnessed the closing of quite a number of good sized contracts for Local Coke Iron, for delivery during the first half of the year. Competition among sellers was so keen that prices were reduced to a lower level than had been touched during the previous three months. The peculiarity of the present condition of affairs is that cuts now made are only of 10¢ @ 15¢ ₱ ton, instead of 50¢ @ $1, as was formerly the case in times of depression such as this. If all the transactions were known it is believed that the aggregate would show a very heavy volume of business for the week. The activity anticipated for January has thus materialized, but by no means in a shape satisfactory to furnace companies. Our quotations are revised to meet the changed condition of the market. Low as prices now are, there are still some large buyers who look for a lower range and are withholding contracts until sellers come closer to their views. The heavy consumption of Iron is indicated by the excellent demand for small lots for quick delivery. The sales of Lake Superior Charcoal have been rather heavier than usual, but by no means compare with the movement in Coke Iron. The exceedingly cold weather of the past week has interfered to a considerable extent with shipments of Iron from furnaces at a distance from this territory, and complaints are numerous from consumers with contracts for season delivery, on which they are depending for a regular supply. Quotations are as follows, cash, f.o.b. Chicago:

Local Coke Foundry, No. 1.....	13.50 @	14.00
Local Coke Foundry, No. 2.....	13.25 @	13.75
Local Coke Foundry, No. 3.....	13.25 @	13.75
Local Scotch...	14.00 @	15.00

Sheets.— General trade is light on Black Sheets, although concerns rolling sheets for tinning purposes are securing considerable trade, and much improvement in the demand is expected in a very short time, as several large buyers are understood to be about ready to place their season contracts. Occasionally parties may be found ready to enter a large order on terms offered, but those who are determined to maintain their reputation for quality have refused orders at concessions. A fair demand is reported for Galvanized Sheets.

Billets and Rods.—Inquiries are more numerous, but with few actual sales made. Some fairly large deals are in negotiation with a prospect of being closed shortly. Buyers appear to be indifferent and not inclined to make offers as a rule unless at prices likely to be declined by makers.

Merchant Bars.— A fair amount of business has been placed since the opening of the new year, a number of mills that were running on half-time being now in full operation. The cold weather in some sections has interfered somewhat owing to inability to procure Coal, a number of concerns being compelled to suspend operations for a time on this account.

Steel Rails.—Prices remain unchanged at the leading centers. There is much inquiry but comparatively little being done, although reports are current that a number of Eastern railroads have placed orders for large lots, while contracts for some roads running into New York are said to be pending.

Structural Iron and Steel.— Some mills are already full of work, and there is little doubt that they all will be as soon as it becomes possible to resume building operations. Meanwhile prices are a little irregular and on desirable orders in some sections a shade lower than general quotations. Eastern mills seem eager to get some "backbone" orders, so that close prices are likely to prevail for a while.

Financial.

The ice blockade at all the principal Atlantic ports, cubes of ice 6 feet thick in Minnesota and the Ohio River frozen from Louisville to its source are among the phenomena that mark a winter of extraordinary severity and betoken a late reopening of navigation, but as yet the effect on trade is scarcely observable. East-bound shipments from Chicago dropped 11,000 tons from about 80,000 tons the previous week and one-third compared with the corresponding week last year, but railway financiers are confident that eventually they will profit largely from the obstruction of rival water routes. Interest in the repeal of the silver law has in no degree subsided, but a sense of relief arises from a conviction that methods will be devised to avert serious embarrassment from the compulsory purchases of silver until remedial legislation can be adopted. The absence of orders for gold shipments, easy money as the result of receipts from the interior, and finally reports from Washington that the Interstate Commerce law would be amended to legalize pooling, also contributed to a better feeling. The withdrawal of New Jersey Central from the coal combination has no immediate effect upon the price of the product, especially while a coal famine is threatened in various directions, but the future remains somewhat obscured. The position of the Lehigh Valley occasions a lively discussion among the stockholders. The Reading people do not believe that the New Jersey authorities will throw Jersey Central into a receiver's hands.

Money is decidedly easier, the banks unexpectedly showing, in their weekly statements, the enormous gain of $6,668,000 in surplus, which makes the sum held in excess of legal requirements $15,610,450, the largest amount since August last. The ease of time money is making a better market for commercial paper, but rates have not declined to a perceptible extent. The best buyers are country banks. Foreign exchange closed at $4.87 @ $4.89. The circulation of the United States, per capita, according to the latest Treasury statement, is $24.32. The present circulation is $1,610,683,874, against a circulation on January 1, 1892, of $1,588,781,720.

The grain markets have been firm and prices advanced, but the export trade continued moderate. Several large orders for future shipment were reported. Exports of wheat thus far this season are 114,300,000 bushels, a decrease of 22,500,000 compared with the same time last year, while the falling off in corn is still more noticeable. Flour was quite active. Hog products again advanced. In cotton there was more animation, but values drooped. Spot cotton declined about $\frac{5}{16}$ cent. Sugars are firm and coffee quiet.

Coal.

Severe weather curtails both production at the mines and shipments to consumers, so that a condition approaching a coal famine threatens many localities. The change of circumstances is so sudden as to have baffled all calculations. Especially is the restricted production enforced for many months past an unexpected source of embarrassment. Happily there are large accumulations at Plainfield, N. J., and other interior points that will be available as soon as transportation is no longer obstructed. Meanwhile consumers will suffer in many instances where the "hand-to mouth" plan has been in vogue, and in some instances manufacturers are compelled to suspend operations for lack of fuel, even in Pennsylvania, comparatively near to the sources of supply. Combine prices nominally prevail, except as to Pea and Buckwheat, which have long been at a premium. In respect to other sizes it is but natural that some dealers where not bound by contracts take advantage of their opportunities. Locally there are several large consumers who are content to obtain fuel regardless of cost. Chestnut Coal is almost out of market. The Reading collieries are again worked to their full capacity.

Chicago Report.

Scrap.—There is no demand for Old Iron or Steel and the following buying prices are nominal only:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$12.50	....
Machinery Cast	10.00	....
Malleable Cast	8.00	....
Stove Plate (free of burnt)	7.00	....

CONDITION OF THE

Hardware Trade.

A very satisfactory result of the cold weather which has so generally prevailed is the depletion of the stocks of nearly all winter goods, both in the hands of dealers and manufacturers, thus clearing out some lines which have been, to a greater or less extent, carried over for several seasons. There are also indications of an early movement in general business, and orders are beginning to come in from the smaller trade and from the jobbers in still larger volume. A marked feature of the situation is the confidence which very generally prevails that the season's business will be large. In the matter of prices there is little new to report, the market as a whole not being characterized by an especially strong tone, and yet there have been a good many slight advances, more in the way of the withdrawals of extras than the announcement of new quotations. There is an evident tendency on the part of manufacturers toward a consolidation of their interests, and in more than one important line negotiations are going on to this end, in addition to which there are many rumors current in regard to similar movements in other branches. It will be noted from the reports given below that there is a general confident tone and the expectation of an early and large business.

From Chicago advices are to the effect that the Shelf Hardware trade is opening up very well as traveling salesmen get to work again, but it is not yet in full swing. The resumption of business this year is much slower than last January, and on this account some merchants are inclined to complain, while others on the contrary are exceedingly hopeful and predict a heavy spring trade. The extremely cold weather of the past ten days, which is worse than anything experienced in the Northwest for five years, has interfered with immediate business, and is, therefore, largely responsible for the dullness of which complaints are heard in some directions. Houses making a special drive on Cutlery report a remarkably good trade for the season. Baby Carriages and other summer goods are also beginning thus early to be inquired for. The Heavy Hardware jobbers state that the new year with them has opened up even better than last year. Consumers of Iron and Steel are buying more freely and in larger quantities, showing that their trade is excellent. Prospects are regarded as very bright for the wagon and carriage trade.

Cut Nails.—The Cut-Nail market has developed no specially new features since our last report, the demand continuing fair but not heavy. Prices are quite regularly maintained. There is a good deal of inquiry on the part of prospective buyers, and indications point to an excellent demand in the near future. Small lots from store in New York are held at $1.75 to $1 80, and carload lots on dock at $1.60 to $1.75, according to average.

Advices from Chicago.—The Lakeside factory is again in operation after a shor stoppage for repairs. A fair inquiry is reported, but only moderate buying. Prices are still quoted at about $1.60 on 30 cent average for factory shipments, Chicago delivery. Small lots from stock sell at $1.65 to $1.70, according to average.

Wire Nails.—A good many Wire Nails have been sold during the past week, many of the larger buyers taking advantage of the low prices now prevailing. The quotation for carload lots at mill is $1.40, and for less than carload lots at mill 10 cents additional is charged. The fact that it is understood that the manufacturers have been conferring with a view to taking action to secure higher prices has not thus far had much effect on the market, but it is obviously the part of wisdom for buyers to watch the market closely.

Advices from Chicago.—An important meeting has been in progress in this city since last Wednesday, under the auspices of the Columbia Wire Company. It is stated that all the manufacturers of Plain Wire, Barb Wire, and Wire Nails have been in attendance, and that arrangements are being made which will terminate the severe competition which has so long raged in these trades. The arrangement has not yet been perfected in all its details, but much confidence is displayed by those interested that it will be pushed to successful conclusion and they assert that prices are now at bottom and will be advanced considerably before the close of the month. A money forfeit will probably be the basis on which the agreement to maintain prices will operate. Transactions in Wire Nails the past week have been only such as were forced by manufacturers. Sales were made in moderate lots from factory at $1.55 to $1.60, Chicago, but lower prices were made on special lots carrying high averages. Jobbers are selling from $1.60 to $1.70 according to quantity.

Barb Wire.—The principal feature of interest in connection with the market for Wire or Wire products is the fact that the producers of raw material, as well as of the finished goods, are conferring with reference to action to improve the condition of things in these lines. Nothing has as yet been accomplished, but some far-reaching measures are in contemplation, and it remains to be seen whether or not they can be carried into effect. At the present time the Barb Wire market is in a somewhat unsatisfactory condition. Prices are rather weak, and yet manufacturers, while evidently desirous of securing orders, are indisposed to make more than slight concessions Quotations depend somewhat upon location. Small lots from store in New York are still quoted at $3.10 for Four-Point Galvanized, carload lots being held at $3.

Advices from Chicago.—This branch of trade is expected to be speedily affected by the movement among Wire manufacturers reported under the head of Wire Nails. Thus far prices are unchanged and range from $2.15 to $2.25 on carload lots of Painted and $2.55 to $2.70 on Galvanized. Jobbers are not maintaining the full difference between their quotations and those of manufacturers, but sell small lots at $2.25, Painted, and $2.70, Galvanized, with 5 cents off for mixed carloads.

Axes.—Standard Axe and Tool Works, Ridgeway, Pa., issue a price-list showing the line of axes they are putting on the market. It represents a number of axes and also carpenters' adze, bark spuds, mining picks and machine knives. Their prices of axes are represented by the following quotations :

Axes, Standard brand, per dozen	$7 00
Axes, Black Eagle brand, per dozen	8 50
Double Bit Axes, Standard brand, per dozen	8 50
Double Bit Axes, Black Eagle brand, per dozen	13 00

Spooled Wire.—The following are revised quotations made by Malin & Company, Cleveland, Ohio, on their Spooled Wire :

	Discount. per cent.
Annealed and Tinned Wires	65
Brass and Copper Wires	55

Tire Bolts.—The market for common Tire Bolts is not in quite as satisfactory a condition as usual, owing in part to the fact that some parties making other Bolts have entered the field, the result being an increase in competition on this line. Some lower prices have thus, in some cases, been developed.

Carriage Bolts.—There is a good deal of irregularity in the market on Carriage Bolts, the competition being active among manufacturers, many of whom quote freely without regard to the nominal prices adopted by the association.

Machine Bolts.—This line is also very much demoralized, and prices are considerably lower than those which have recently been ruling.

Wrought Iron Goods.—There has been within a short time a still further decline in the prices of Wrought Iron goods. The market is yet without strength and somewhat irregular.

Bright Wire Goods.—There seems to be more or less unevenness in the market, and quotations are made in exceptional cases, which indicate a reduction in the price of the goods.

Galvanized Conductor Pipe.—The manufacturers who agreed upon an advance in the list price of 1 cent per foot, on 2 and 3 inch galvanized corrugated conductor, as proposed at the convention of Eave Trough and Conductor Pipe Manufacturers, held at Canton, Ohio, December 14, 1892, have returned to the old list. The list prices on these sizes are now 12 cents for 2-inch and 15 cents for 3-inch as before.

Gasoline Specialties. — Clayton & Lambert Mfg. Company, Ypsilanti, Mich., are selling their Gasoline Specialties at the following prices, f. o. b. Ypsilanti:

No. 1 Fire Pot	$ 6.00
No. 2 Fire Pot	12.00
No. 3 Fire Pot	16.00
No. 1 Paint Burner	4 00
No. 1 Electric Torch	4.00
No. 2 Brazing Forge	10.00
No. 3 Brazing Forge	15.00
No. 1 Tailors' Fire	15 00
No. 2 Tailors' Fire	25.00
No. 1 Sad Iron Heater	30.00
No. 1 Burner and Swivel	2.00
No. 1 Burner, only	1.50
No. 1 Swivel, only	.50
No. 1 Bulb	.30
No. 1 Air Valve	.25
No. 1 Filler	.25
No. 1 Filter Plug, only	.15
No. 1 Needle Point	.25
Iron Top for No. 1 Fire Pot	2.00
Base for same, complete	4.00

Glass.—The severe cold weather has had a depressing effect upon building interests, consequently the demand for Glass both from factory and from jobbers is reduced. The price which buyers have paid for Glass in car lots since the factories started up is stated as being 85 per cent. discount for Single, and 85 and 5 per cent. discount for Double. Recently they have been able to purchase at these prices shaded from 2½ to 5 per cent. Those now in the market with orders are trying to contract Glass for 85 and 5 per cent. discount, all around, including Single and Double Strength. The future prices of Glass depend largely upon whether the National Glass Company prove to be a success or not. The company, we are advised, now have a charter and are awaiting the action of some of the directors of the individual companies through the States before completing permanent arrangements. This company are, we understand, a proposed combination of the manufacturers and jobbers, and their object is to make carload buyers pay a fixed price for Glass. The arrangements of the American Plate Glass manufacturers have been completed, and D. E. Wheeler has been appointed general agent for all the manufacturers, with headquarters Room 614, Times Building, Pittsburgh, Pa. This arrangement was to take effect January 14. There is no change in the condition of trade or in the price of imported Window Glass, the demand being all that could be expected at this season of the year. Quoted prices on Glass are as follows: American Window Glass, 1000-box lots or more, 80 and 15 per cent. discount; carloads, 80 and 10 per cent. discount; less than carloads, 80 and 5 per cent. discount. French Window Glass, 75 and 10 and 5 per cent. discount. American Plate ranges in price from 50 and 10 and 7½ per cent. discount to 60 and 2½ per cent. discount. Imported Plate Glass, 60 per cent. discount to 60 and 10 and 5 per cent. discount.

Trade Notes.

The Clifton Springs, N. Y., Mfg. Company have elected: Directors, J. E. A. Brooks, Herbert C. Evered, Rush Spalsbury; president, Rush Spalsbury; secretary and treasurer, H. C. Evered. Mr. Brooks will continue as superintendent and the works will soon be in operation.

The Eddy Valve Company of Waterford, N. Y., have secured the contract for furnishing the Hydrants needed to extend the water system of Syracuse, N. Y. Their bid was: Valves, $21,185; Hydrants, $21,000; extras, $1,450.

Haight & Clark, Iron founders, of Albany, N. Y., issue a circular calling attention to their facilities for making all kinds of Iron Castings, as well as Brass, Bronze and Aluminum Bronze Castings, from patterns furnished them or from patterns made by them, if desired. They

also do drilling, lathe work and finishing, and Nickel, Brass and Bronze plating and japanning.

THE TROY, N. Y., VALVE COMPANY have been incorporated. They will manufacture and sell Valves, Hydrants and other articles pertaining to them. The capital stock is $30,000. The following are directors: Esek Bussey, 60 shares; Chas. A. McLeod, 60 shares; William Ross, 75 shares; Adam Ross, 2d, Robert Ross, J. C. Ross, each 25 shares; Esek Bussey, Jr., Sayre McLeod, each 15 shares. The concern is incorporated for 50 years, and the principal office will oe at Troy. The trustees are: Esek Bussey, Charles A. McLeod, William Ross, Adam Ross and Esek Bussey, Jr.

BRADLEY FERTILIZER COMPANY, 92 State street, Boston, are directing attention to the new Griffin Mill for pulverizing quartz, carbon, foundry facings, plumbago, cements, &c. Cuts of the Mills and a brief notice of their advantages are presented in an advertisement elsewhere.

THE FIRM of S. A. Wilde Mfg. Company, Taunton, Mass., manufacturers of Tinware, was dissolved on the 5th inst. by mutual consent. Samuel A. Wilde has retired from the firm and Randall Dean will continue the business under the name of the Dean Mfg. Company. Mr. Dean assumes the assets and liabilities of the old concern.

IRONCLAD STOVE POLISH COMPANY, Middletown, Conn., are now putting up their goods in a handsome black box, which makes a very attractive package.

THE CLAYTON & LAMBERT MFG. COMPANY, Ypsilanti, Mich., issue little circulars directing attention to several of their specialties, among which are their No. 1 Fire Pot for tinners and plumbers, No. 4 Brazing Fire and their No. 1 Paint Burner or Plumbers' Torch. They likewise issue on a card a prize-list of gasoline specialties, including Plumbers' and Tinners' Tools.

IN THIS ISSUE will be found the advertisement of the McKinley Tin Plate Company, Wilkinsburg, Pa., manufacturers of Roofing Plates. The goods of this concern have been in the market for some time, and have met with a hearty reception from the trade. Since their commencement their business has constantly increased, and their product is now being sold about as fast as made. It will be observed that the firm make three brands of Roofing Plates.

THE TROY VALVE COMPANY, capitalized at $30,000, have been incorporated at Albany, N. Y. The company will manufacture Valves and Hydrants and articles pertaining to them. The principal office will be located at Troy.

WE HAVE RECEIVED from Held & Gruenhagen, 924 and 926 Raymond avenue, St. Anthony Park, Minn., a four page circular of their Detachable Radiating Drums, illustrations of which were presented in these columns some time since. The circular presents various views of the device, together with descriptive letterpress and price lists.

JOS. A. BOGARDUS, 167 Chambers street, New York, presents an attractive 1893 calendar, on which attention is called to Hardware, Agricultural Implements and House-Furnishing Goods, of which he is wholesale dealer and jobber. The larger portion of the card, to which the date sheets are attached, is devoted to a colored winter landscape.

ELSEWHERE IN THIS ISSUE will be found the half page advertisement of McClure & Co., 62 Second avenue, Pittsburgh, Pa., importers of Tin Plate and dealers in Metals, Sheet Iron, Wire, Copper, Tinners' Tools and Machines. This firm is composed of Thomas G. McClure, for a number of years with John Dunlap & Co., Tin Plate dealers of Pittsburgh, and J. J. O'Connor, who for some years was connected with Gummey, Spering & Co. of Philadelphia, but who for the past two years has represented N. & G. Taylor Company of Philadelphia in Pittsburgh. The new firm will carry full stocks of the above lines of gooda.

WE PRESUME in the nature of things, there must be some limit to the expense and elaboration of New Year calendars that are sent out by manufacturing firms and others to their friends and customers. If there be a limit of this sort, however, to these New Year souvenirs, we think it has been about reached by Ginna & Co. of New York, who favor their friends with a beautiful example of artistic decoration. It is a sheet of 14 x 20 tin, framed in white and gold, carrying at the lower corner a pack of 36 shield-shaped calendar sheets, telling the days of the months for the ensuing three years. A feature of the publication, if we may so call it, is the decoration of the sheet, which shows a group of poppies and small birds. The coloring is exquisitely done and the design is thoroughly artistic.

THE MANAGERS and traveling salesmen in the employ of the Kieckhefer Brothers Company of Milwaukee, Wis., enjoyed a banquet given in their honor by the company at the Schlitz Hotel in that city on the evening of the 11th inst. All present agreed that they had a very pleasant time and expressed the common sentiment that the only cause of regret as to annual banquets was that they occurred but once a year.

THE UNIVERSAL SAD IRON COMPANY of Milwaukee, Wis., state that their Irons are steadily growing in favor. The introduction of a new article to the Hardware trade is necessarily of slow growth, but in localities in which these Irons have obtained a footing in the trade they have proved great favorites with housekeepers, dressmakers and tailors. Nos. 7 and 22 are proving the most popular of the sizes made, they being the largest for families and the largest for tailors, respectively. The Universal is a charcoal Sad Iron, ingeniously arranged to retain fire with a minimum consumption of fuel when the Iron is not in use.

UNDER DATE January 9, the Lalance & Grosjean Mfg. Co., New York, and St. Louis Stamping Company, St. Louis, issue a circular in which they advise the trade that they have acquired all patents relating to the manufacture of the ware known as Onyx, including the process of making and the trade-mark Onyx as applied to such goods. In our last issue in referring to this matter we omitted mention of the St. Louis Stamping Company, who, conjointly with the Lalance & Grosjean Mfg. Company, own the patents and trademark in question and unite in the announcement to the trade.

Price-Lists, Circulars, &c.

THE CONSOLIDATED FRUIT JAR COMPANY, New Brunswick, N. J., and 49 Warren street, New York. Sheet Metal Goods. They have just issued an illustrated catalogue and price list of 100 pages, 8 x 10 inches, handsomely printed on fine plate paper, containing a portion of their products. They announce that a large proportion of their production is proprietary goods, a specialty being the manufacture of such articles, and call attention to the fact that they will at all times be pleased to furnish estimates thereon. Among the articles noticed in the catalogue is a large assortment of Oilers and Spouts, Fruit Jar Trimmings, Can Screws of almost every description, Sprinkler Heads, Ferrules, Lubricating Cups, Torch and Collapsible Tubes, Electric Light Fixtures, Tin Boxes, Rosettes and Ornaments, principally sheet metal goods. Attention is called to their extensive experience in making Glass Molds for use in their own business, which has resulted in opening their shop for orders from the trade generally. They refer to their facilities in this line as unsurpassed.

HILL DRYER COMPANY, Worcester, Mass.: Clothes Dryers and specialties in Wooden Ware. The line of goods manufactured by this company includes the Champion Clothes Dryer for yard, Balcony Clothes Dryer for back balcony, Folding Ironing Tables, Folding Wash Benches, Folding Pantry Steps, Clothes Horses, Step Ladders, Pastry, Meat, Bread, Shirt and Sleeve Boards, Camp Stools, Pillow Sham Holders, &c.

THE CENTRAL STAMPING COMPANY, New York: Sheet Metal Ware. A handsome catalogue gives illustrations of articles selected from their large catalogue, the coloring and decorations being copied from regular goods and represent the extensive lines of House-Furnishing Sheet Metal Ware which they manufacture. Illustrations in color are given of Royal Copper Tea Kettles, Royal Copper Tea Kettles, nickeled; Crumb Pans and Brushes, Children's Fancy Trays, Tea Trays and Coal Vases.

RIDGWAY REFRIGERATOR MFG. COMPANY, Philadelphia, Pa.: Cold Storage Buildings, Ice Houses and Domestic Refrigerators. Their catalogue illustrates, with prices, a line of Ridgway and also of Keystone Refrigerators, each made in domestic and sideboard styles. The manufacturers state that the various kinds of provisions, fruits, butter, milk, &c., can be kept in the same compartment without one becoming tainted with the flavor of the other.

GURNEY REFRIGERATOR COMPANY, Fond du Lac, Wis.: Gurney Refrigerators. Illustrated circulars give interior and exterior views of these goods, also of the Removable Galvanized Ice Compartment. The points of excellence possessed by these goods are strongly brought out in verse, under the heading "Mary Brown's Neighbor," accompanied by an illustration. For this Refrigerator the managers claim cleanliness, free circulation, economy in the use of ice, condensation and dry air, low average temperature, freedom from condensation on the inner walls, freedom from damage by the use of ice picks, proper location of drip pipe and long life.

A bell weighing 600 pounds and designed as a gift from the Seventh Regiment, N. G., S. N. Y., to the United States Cruiser "New York," is being manufactured at the bell foundry of Clinton H. Menceley, Troy, N. Y. The bell will be 31 inches in diameter at the mouth and cost $2000. An unusually large amount of silver will enter into its composition, which will be silver, copper and tin from American mines—the first large bell of American metals ever produced in this country. The bell will be magnificently engraved with elaborate designs, a coat of arms and scenes appropriate to the service to which it will be put. An inscription will be placed on the rim, and the whole will be polished like a mirror.

A trans-Pacific cable is to be built at once. A contract has already been entered into between the colony of Queensland, Australia, and La Société des Telegraphes Sousmarine for a cable from Brisbane, the capital, to New Caledonia, Fiji, Samoa and the Sandwich Islands. The idea of the promoters is to extend it to America. The company have the option of making the terminus at San Francisco or Vancouver. The estimated cost is $10,000,000.

Stove Trade Notes.

(*Continued from page* 61.)

Western Iowa and Nebraska; Oscar S. Case, in Missouri and Kansas; E. B. Eberley, in Kentucky, Tennessee and the Southern States; P. M. Thomas, in Pennsylvania, Virginia, West Virginia and Maryland, and R. J. Minkley, in New York.

Thomas White Stove Company of Quincy, Ill., have enjoyed a prosperous business during the year just brought to a close and look forward to an increased trade for 1893. Some of their leading specialties have met with a very gratifying reception, prominent among the number being White's oak and a soft coal heater with solid air-tight base. Also the New Princess, a neat Todd stove. A number of new patterns in coal and wood cooks have been added to the company's assortment, and the variety now offered the trade is said to be very full. During 1893 the company's interests will be represented on the road by George W. White, Henry Wilson, M. Kirtley and J. H. McAfee.

The salesmen who will represent the interests of the Brand Stove Company, Milwaukee and Chicago, during the year 1893 include D. W. Lansing, who will cover Minnesota and Dakota; D. O. Danielson, Iowa and Nebraska; H. S. Crane in Wisconsin; W. V. Gillespie in Michigan and Illinois; A. V. Smith in Indiana and Northern Illinois, E. W. Kasten, who will look after the trade in Milwaukee, and D. Van Evera; who will represent the company in Chicago.

Robert Robinson & Son of 105 Lake street, Chicago, have a force of traveling salesmen for 1893 consisting of W. H. Bliss, who will travel in Northern Indiana, Illinois and Eastern Iowa; Thomas Hoffman, who will cover Western Iowa and Nebraska; T. A. Lewis, Southern Iowa and Northern Missouri; E. H. Voorhees, Kansas and Western Missouri and L. F. Hyne and J. A. Newton, in the city of Chicago and suburbs. The furnace department will be represented by M. R. Story and H. S. Heep.

Bussey McLeod Stove Company of Troy, N. Y., will be represented during the ensuing year by W. P. Welch, who will travel in Vermont and Northern New York; Charles M. Velsey in Eastern New Jersey, Connecticut and Massachusetts; A. C. Chatfield in Central New York and Ohio and J. Q. Palmer in Western New York.

The Abram Cox Stove Company employ the following traveling salesmen, who will cover different territory according to the requirements of the business: Charles Lehman, Jr., E. E Barto, D. C. Armbrust, E. C. Barker and Frank Eckfield.

Russell Wheeler & Son of Utica, N. Y., have made arrangements for the following territory to be covered by the traveling salesmen named: Eastern and Central New York by Henry L. Stroebel of Utica, N. Y.; New England and the Southern States by S. B. Fitch of Boston; Northern and Western New York by Frank McCarty of Oswego; Southern New York and Pennsylvania by W. J. Kennedy of Binghamton; Ohio, Indiana and Michigan by H. A. Simmons of Detroit, and Iowa, Illinois and Minnesota by George C. Powers of Des Moines, Iowa. In a short time the firm expect to add a number of traveling salesmen to represent their hot-water department.

The Reading Stove Works of Reading, Pa., employ a good staff of traveling salesmen, who for 1893 will cover the territory named. J. W. Sheeler will travel in Eastern Pennsylvania, portions of Maryland, Virginia and West Virginia; H. J. Fueller will canvass Central and Western Pennsylvania, Eastern Ohio and portions of West Virginia and Kentucky; Charles H. Shick will solicit orders from dealers in Western Ohio, Eastern Indiana and portions of Kentucky; T. D. Dreher will cover Northern New Jersey, New York City and Northeastern Pennsylvania; S. S. Sands will, as usual, visit his friends in the trade in Central and Western New York; C. H. Andrews will be Eastern representative of the company, with headquarters at Boston, for all trade in the New England States. C. A. Rusco has been placed in charge of the company's Western branch at 15, 17 and 19 West Lake street, Chicago, and will look after the business in the West. The trade in the South will be attended by William Thomson, with his efficient assistants, A. J. Thomson and C. Osmand. The company are adding to their already large assortment a number of new and desirable patterns, combining some original features, which they feel will be acceptable to the trade.

The B. C. Bibb Stove Company, Baltimore, Md., employ William Hayden Jones to look after their interests in South Carolina, Georgia and Florida, and M. S. Watkins to solicit orders in Baltimore City and vicinity. Salesmen for North Carolina, Virginia and a part of Maryland have not yet been appointed.

The Howard Furnace Company have not as yet completed their list of salesmen for the new year, but so far as arrangements have been made the staff consists of R. S. Van Keuren, who will cover the territory east of Syracuse to the Hudson River, Western Massachusetts, Central and Southern Pennsylvania, and as far south as Washington. Edward Foord of Syracuse, N. Y., will cover Northern New York, west of Syracuse, Northern Pennsylvania and Eastern Ohio. F. M. Tyler of Grand Rapids, Mich., will travel in the State named, as well as cover the northern portions of Ohio, Indiana and Illinois and the southern portion of Wisconsin and western portion of Iowa. The New York branch of the company is in charge of W. B Wilkinson of 254 Water street, with traveling salesmen covering Western Connecticut, Southern New York, New Jersey and Long Island. The Boston branch, at 61 and 63 Blackstone street, will be in charge of Thomas P. Healey, with salesmen covering the New England States east of the Connecticut River.

The Anshutz-Bradberry Company of Pittsburgh, Pa., have engaged L. M. Armor to look after their interests in Ohio, Iowa and Illinois and W. C. Latchew in Pennsylvania, Maryland and West Virginia.

The Carton Furnace Company of Utica, N. Y., have the following list of salesmen who will travel in their interests during 1893 in the territory named: J. B. Jones, secretary of the company, will have general charge of the Western trade and will look after the Western agents. M. Bradley will cover the New England States, Pennsylvania and New Jersey; W. G. Barrows, New York State; Lewis Fuess, Ohio, Indiana, Illinois, Iowa, Wisconsin and Michigan; James Ryan, Central New York; John H. Carton, Missouri, Kansas and Nebraska; Henry A. Benoist, the Southern States, and John F. Dwyer will have charge of the Pacific Slope trade.

J. Van Wormer & Co. of Albany, N. Y., will be represented on the road during the ensuing year by David A. Andrus, who will cover the States of New York, Ohio and Indiana; H. C. Whitten of Boston will look after the company's interests in a portion of the New England States, while T. H. Reed of Worcester will take care of Connecticut, New Jersey and portions of Pennsylvania; G. W. Cahoon of St. Paul will represent the company in the Northwest. We also understand that the company will supply the jobbing trade through the Great Western Stove Company of Leavenworth, Kan., A. L. Lindemann & Hoverson Company of Milwaukee, Wis., and Charles E. Clark of Chicago.

Fuel Consumption.

One of the questions usually put to the steam or hot water heating engineer when he is endeavoring to secure a contract is, "how much coal will it take in cold weather to heat my house with your apparatus?" The answer can seldom be evaded, although in many instances an evasion would be very much of a relief to the would-be seller of a heating plant. He knows or is confident that his apparatus will devour no more fuel than other heating apparatuses with which he has to compete; he knows, perhaps, also, that these same competitors are really and truly economical of fuel, yet he also knows that if the man whom he hopes to persuade to become a purchaser has never had experience in thoroughly warming a whole house, truth, "the whole truth, and nothing but the truth," as to how much coal will be needed, will rather astonish the individual upon whom his eloquence has been expended. And if he musters courage to tell the naked truth, won't the other fellow stretch it just a little, just enough to knock him out of the hoped-for contract? What shall he do? The sin may seem very small, while the temptation to commit it is very great. If advice is asked of us as to the proper method of proceeding in such a quandary, we should answer, tell the truth; tell it without hesitation or seeming to hesitate; but do it so that the man whom you wish to purchase your apparatus may understand why it is the truth, and so, when the other fellows begin to underrate fuel consumption, your man will be prepared to read their inner souls and know that they are—well, let us say, misled by zeal into inaccuracy of statement.

How to Rate Fuel Consumption.

"My dear sir," we should say, "there is a vast deal of difference between warming a small dining room, parlor and perhaps, also, a bedroom, with a good kitchen fire always going to help the thing along, and thoroughly warming a three-story and basement house of 12 rooms, with an abundance of glass in the form of bay windows in front and a conservatory at the rear. Your architect, either by his own computation, or advised by an expert, has decided that it will take 750 square feet of radiator surface besides risers, radiator connections, &c., to do this warming in zero weather. Now, for each hundred feet of this surface 30 pounds of water per hour must be made into steam in the boiler I hope to put in, or (if I am to be disappointed in that hope) by any other boiler you may decide to purchase. Therefore, no matter what apparatus you use, unless the amount of heating surface required has been overestimated, you will need to evaporate 225 pounds of water per hour in extreme weather to keep this house uniformly warm from attic to cellar. Now, my boiler, which I claim to be more efficient than the average, will generate 8 pounds of steam for each pound of coal burned, provided it has a fair chance, and hence it will burn a trifle over 28 pounds of coal per hour under the conditions named. If the temperature is to be kept uniform in all parts of the house, it will, in severe weather, take 24 times 28 pounds of coal to do the warming, or 672 pounds per day. If the other fellows claim they can beat this, ask them how many pounds of water per pound of coal they can evaporate per hour. If they say 9, you have room for doubt. If they say 10, you had better doubt pretty hard till they verify their claim. If they say 11, go to some disinterested expert and ask him what he thinks of the possibility of obtaining such efficiency in any boiler of a capacity to evaporate 225 pounds of water per hour, and see if he don't say that the zeal of the other fellows to make a sale has led them to—well, to an inaccuracy of statement."

Trade Education Abroad.

We have much pleasure in presenting this week a notice of one of the latest acquisitions to the ranks of technical training institutions and trade schools in Great Britain. The account of the Borough Road Polytechnic Institute of London will, we believe, be acceptable to those of our readers who are interested in the matter of trade education. This important question is, we are glad to observe, receiving much attention from the trades and general public in the United States. All information, therefore, in regard to the methods pursued in other countries to further the better technical training of their artisans should be valuable to us, and we may glean useful hints from the procedure of other nations in this respect. One feature in connection with the establishment of the educational work of the above-named institute which is not touched upon in the article appears to us to be worthy of special notice and commendation. In the first days after the opening of the building for use, and previous to commencing the educational classes, special meetings of London artisans of various branches of trade were called together. These meetings were held under the auspices of the different trades guilds and companies represented, and were free and open to all. The object was to confer as to the course of instruction that should be followed in the various classes. Conferences of plumbers, builders, sheet metal workers, boot and shoe makers, printers, photographers, &c., took place at the institute. From the representatives of these trades many practical suggestions and much shrewd and useful advice were obtained, and in many cases acted upon. The general sense of these meetings appears to have guided the governing board of the institute in the arrangement of the course of instruction; and we have no doubt the result will be of the greatest benefit.

Gas as Fuel.

Gas, both from natural and artificial sources, has been found a very convenient fuel for many purposes and its use is likely to increase with improvements in appliances for burning it. In only one way, and that a very uneconomical way, has it been applied to heating rooms so as to be free from objection from a sanitary standpoint. Gas logs in grates where the gases of combustion are allowed to escape freely through an open flue aid in keeping pure the air of the rooms in which they are placed, through their action in drawing the least pure air from the lower part of the inclosed space and carrying it out into the exterior atmosphere. But when so used a very large amount of heat produced by the combustion is wasted. About the only heat utilized is that radiated from the flame and the heated logs into apartments before the heated gases enter the flue, and as the passage from the jets to the throat of the flue is short, there is only a fraction of a second of time after ignition for this action to take place before the radiation from the hot gaseous mixture is almost entirely cut off. If one could light the gas issuing from gas logs, then immediately extinguish it, and measuring the quantities of heat that respectively are thrown out into the room and wasted through the flue, most people would be astonished at the extent of the waste. One foot of gas burned within a space to be heated in a good Bunsen gas burner will affect the temperature of an apartment nearly or quite as much as 10 feet burned in an open grate. But the burning of gas enough to heat a room in cold weather without any provision for escape of the products of combustion not only vitiates the inclosed air, but is also attended with other inconveniences. A large amount of water in the form of steam is generated in the combustion of gas. The condensation of this

steam from gas burned for illumination only does not give much annoyance, but in cold weather used even for this purpose it often clouds windows with vapor that either drips down or freezes on the glass, thus rendering the windows unsightly by day and obstructing vision. This effect is so intensified in a room wholly heated by gas jets in the free space as alone to become an important objection to the method. A room so heated also acquires an odor not only unpleasantly perceptible to nearly every one, but to many persons quite intolerable.

An Improved Gas Stove.

There thus arises a want for a gas stove in which gas may be economically burned for warming rooms without the above-named objections. Such a stove would meet with a large and ready sale in all large cities wherein a considerable number of people are forced to live in rooms for which no special means of warming have been provided. 1. Such a stove should have Bunsen burners, or equivalent burners for completely consuming the gas. In this way all the heat possible to be generated by the combustion of a given quantity of gas will be obtained. 2. Means for extracting this heat from the gas flame by suitable conducting and radiating surfaces must be supplied. Lastly, the burned gas, after having been cooled by contact with the surfaces that transfer its heat to the surrounding air and objects, must be conveyed into the outer air. These are the three requirements for a gas heater that will remove the objections hitherto existing against common illuminating gas as fuel for warming apartments. In order that in avoiding these objectionable features another serious objection may not be introduced, the cost of the apparatus must be within reasonable limits. It does not seem so difficult to secure the three requirements named, together with the fourth, as to deter an inventive mind from grappling with the problem. The burners already exist. A sufficient metallic surface, arranged to allow the heated gas to flow over one side while the air to be heated flows over the opposite side, will meet the second requirement. A suitable pipe for carrying away the spent gases and water vapor through an opening cut in a pane would meet the third requirement, though doubtless to construct this part of the apparatus in such manner that the draft would always be outward might tax ingenuity. As to cost, the designer should neglect nothing that tends to reduce it, provided that the other requisites are not interfered with. Efficiency, at the sacrifice of ornamentation even to the extent of entire absence of decorative features, should be the prime consideration.

The Welsh Tin Platers.

Reports are current of labor difficulties in tin-plate factories in which newly-arrived Welsh workmen are employed. In some cases it is known that such radical differences arose between the management and their Welsh employees that all of the latter were discharged and their places filled with men of other nationalities, who were expected to prove more reasonable and less under the control of hide-bound prejudices against the use of labor-saving devices. We know of one instance in which a very progressive and energetic manufacturer found himself so hampered by continual opposition to his wishes and steadfast adherence to ancient customs transferred to his factory from Wales, that he has put himself on record against the employment of another Welshman in his establishment. The experience of this gentleman was that every step taken by him was regarded with suspicion. His whole force was arrayed against him, and the merest alteration in the arrangement of any portion of the factory was at once the subject of the most earnest consultation, and if its object was not thoroughly explained and then perfectly comprehended by the workmen, they dropped their tools and walked out.

Valuable Workmen.

From the knowledge of such occurences as these arises the temptation to generalize, and to conclude that because such things have happened, therefore Welsh workmen are wholly unreliable. We are happy to say this is not the case. There are other tin-plate factories in which but slight difficulty has ever arisen between the management and their Welsh workmen, and the latter have proved to be quick to adapt themselves to new conditions, very reasonable in their view of the adoption of new processes and labor-saving machinery and willing to assist their employers in establishing the new industry on a plane advanced above that established in Wales. We hear of very good results in notable instances in which newly arrived Welshmen have been employed, and in these cases manufacturers deem themselves fortunately situated in being able to secure skilled workmen of long experience to enable them to turn out tin plates of immediately acknowledged superiority.

The Welsh in Other Trades.

In this country, with its mixed nationalities, it is a very easy matter to excite prejudice against a particular race. Ideas of such a character are imbibed unconsciously by persons who pride themselves on their judicial fairness. There is too great a tendency to permit the conduct or disposition of a few representatives of a race to determine how it is to be regarded as a whole. In the matter of the Welsh tin plate workers, the narrow-mindedness of individual workmen causes their fellow-countrymen to suffer. The fact is overlooked that Welsh workmen are not new to this country. Immigrants from Wales were among the earliest settlers here, and they and their posterity have contributed much to the glorious record of America in industrial as well as commercial, financial, military and intellectual achievements. Their influence has been felt particularly in the iron and coal trades. There are honored Welsh names in the list of those who have become prominent as captains of industry and leaders of mechanical progress. Men who bear such names as Thomas, Williams, Jones, Morgan, Richards, Davis, Evans, Roberts, Hopkins, &c., are of Welsh extraction. Those who bear them lie under no ban, but can point to the history of the American iron and coal trades, with which their family histories or personal histories are interwoven. At this late day a few obstreperous and wrong-headed men among the many tin-plate workers who have come over here can hardly bring more than slight discredit on a people known and honored among us from the earliest settlements.

The Boy in the Barrel.

There is an often quoted adage which is, "Nothing succeeds like success," and this seems indisputable, but sometimes we find our success a failure. For instance, a man may save a flow from the top of his barrel and lose it at the bung hole. Apropos to this is an ancient yarn, which may illustrate the point and also point a moral.

Mr. X had a barrel with one head in place and wished to use it empty with both heads attached. From his lack of cooper skill or may be because, as he said, "The pesky thing was out o' kilter," it would not hold its head up while the hoops were driven, but let it drop at the first blow. After several failures he put his small boy inside to hold up the contrary head and soon said, "There, that's done; nothing succeeds like success." Voice from the barrel, "Father, I want to git out." Response from outside, "Well, I'll be durned." There have been times in almost every one's experience when, having a special end in view, we have thought only of ultimate success regardless of the means employed, finding in our hours of triumph that we had left the boy in the barrel.

There was a time, still remembered by the ancients, when boys were "bound apprentices" to learn trades, and being compelled to remain under tutelage for a term of years would, if not incorrigibly dull, come out at majority with a freedom suit and a practical knowledge of at least the first chapters of their calling. But that style of technical education has passed and now the average learners of the trade, with the possible exceptions of graduates from trade schools, will stay under instruction about long enough to master the shop vernacular, and then fancying themselves full fledged journeymen, seek employment successfully, which lasts until some job presents that they have neither theory nor practice in, forcing them to admit the error of leaving a boy in the barrel. Men who embark in business ventures with limited capacity, capital or credit may succeed in persuading the public temporarily that such buried investments as family and personal luxuries that a struggle for social position usually requires are warranted by their profits, leaving a margin for trade purposes, but often it is found that they are unavailable, like the boy in the barrel. Trade unions are, no doubt, of advantage to their constituent membership, which may be enjoyed without a refusal to recognize the claim that all men, including employers, are in the words of our vaunted Declaration of Independence "endowed by the creator with certain inalienable rights." Failing to see this truth and confining the application of their maxim, "an injury to one is an injury to all," to a limited number, they would compel a following of their theories on work and wages notwithstanding their admitted conflict with the laws of supply and demand. Men by concerted action may arrest for a time the revolution of industrial wheels, but while engaged as brakes they are liable to be broken, and the muscles which refuse labor, for reasons which do not square with the Golden Rule, may get out of practice in conveying food to the mouth. Here also is a striking instance of the boy in the barrel. More might be written concerning this matter of success without succeeding, which, though it reads like a paradox, is often met with in life, teaching in the dear school of experience that it is better to keep the boy out of the barrel.

PLUMBING AND GAS FITTING.

The New York Examining Board of Plumbers.

There is considerable dissatisfaction expressed at the dilatoriness exhibited by the chief executive of New York City in the failure to carry out the provisions of chapter 620 of the laws of 1892, otherwise known as the act to secure the registration of plumbers and the supervision of plumbing and drainage in the cities of the State of New York. Four weeks only now remain within which to appoint the board, to have the board organize and formulate rules to be observed, to examine the qualifications of new applicants, and to issue licenses to every plumber doing business in the city. The bill requires (Sec. 6) that after March 1, 1893, it shall not be lawful for any person to engage in or carry on the trade, business or calling of an employing or master plumber unless he can produce his certificate of competency for the inspection and satisfaction of the Health Department at the time of registering in the department. If they are not in possession of this certificate they must either suspend business operations until they have complied with the law or take chances by violating the statute.

Some years ago, when Commissioner Rollin M. Squire was at the head of the Department of Public Works, the plumbers were required to surrender their old licenses and take out new ones, the applicants to be examined by the License Committee of the Master Plumbers' Association. The time occupied in this cancellation and renewal was considerable, and the plumbers' committee were compelled to sit every night up to a late hour at their rooms to examine applicants so as to facilitate the work. There are very many more master plumbers in New York now than at that time, and it will tax the resources of the board to the utmost to put all the applicants through before March 1

The plumbers owe it to themselves to bring pressure to bear upon the Mayor to make the appointments. Other cities in the State have already recognized the mandatory character of the law, and the Empire City should not be allowed to fall behind in the march of progress.

Water Pipes Clogged by Fungus Growth.

From INQUIRER, *New York.*—Can you account for the presence of a sort of fungus growth in water pipes in New York City, by which the pipes get filled with matter somewhat resembling very fine oakum? A prominent master plumber in this city—Frank Reynolds—has had some perplexing experience of this character which involved considerable outlay of time and thought before he could successfully cope with the obstruction. Have any of your readers had a similar experience? It would be interesting to know how they overcame the difficulty. Mr. Reynolds, I learn, has solved the problem to his own satisfaction.

Answer.—As the information contained in the above is too scant to enable us to construct a theory, a representative of *The Metal Worker* interviewed Mr. Reynolds, and obtained his views on the subject, which we present as the most practical answer to our correspondent. Mr. Reynolds describes it as something resembling oakum, which from long soakage in water had become, as it were, rotten. This was carried into the stop cock on the main in the street, and even into the building, frequently in such quantity as to choke off the supply, necessitating the digging up of the streets. On investigation the material proved to be a sort of fungus growing on the inside of reservoirs known as "snake grass," as fine in texture as very fine oakum. In the passage of the water through reservoirs this grass or fungus becomes detached, and floating through the large mains is drawn into the house main, with the clogging effect already stated. To such an extent did it abound that in the neighborhood of the building affected, and in which Mr. Reynolds was interested, a fire hydrant on being opened was found so completely clogged as to afford sufficient snake grass to fill a bucket. Mr. Reynolds had some thinking before he devised a means of excluding it from the house, in which he eventually succeeded. As "Inquirer" states, it would be interesting to our readers and to the trade generally to learn if difficulties of a similar character have been experienced by plumbers in other places. Diagrams of devices adopted with explanation will be acceptable if forwarded to *The Metal Worker*, and in the meantime we shall endeavor to procure one of the devices used by Mr. Reynolds.

Thawing Frozen Pipes.

From E. D., *Halifax, Canada.*—I would like to find out through *The Metal Worker* how the craft in some of your frost-smitten towns deal with frozen water pipes. Our winters here are not made up of continuous cold weather. We are liable to sudden changes and this takes people off their guard, the thermometer sometimes dropping 20° and 25° between nightfall and daybreak. The result is, hurried calls for the plumber. Thawing water pipes is probably the most disagreeable work that the tradesman undertakes. Where the pipes are accessible the steam lamp generally makes short work of starting the water, but within covered walls and under floors a job is often met with that taxes all the ingenuity of the work man, for it goes without saying the plumber disturbs the woodwork as little as possible. In such cases we know of nothing better than the old time coil ½-inch composition gas tube with a funnel stuck to one end. This works well, however, until a bend in the frozen pipe is met, when a carpenter must be summoned and a fresh start made at a new point. It is not at all likely that we are acquainted with the best methods of treating such jobs. We get our cues chiefly from the English—that is, old country—plumbers and they, as a rule, are good workmen. But there is not frost enough in their moist island to enable them to acquire much experience in this line of work.

The Master Plumbers' Convention.

From HOOSIER, *Indianopolis, Ind.*—Can you inform me why it was that the Executive Committee of the National Association of Master Plumbers at its recent meeting in New York voted to change the place of meeting of the convention in June from Indianapolis to Milwaukee? It cannot be that they were afraid we were not up on the entertainment question.

Answer.—We have no reason to think that the Master Plumbers' National Committee entertained any such idea. The representative of *The Metal Worker*, in his intercourse with the members of the National Committee when in this city, understood from them that there were certain weighty reasons for the change, but no thought derogatory to Indianapolis entered for an instant into the consideration of the subject. It was a matter of business policy, which under the circumstances the Executive Committee were competent to decide.

New York Master Plumbers.

The officers elected for the year 1893 by the New York Master Plumbers' Association are as follows:

President, Henry G. Gabay.
Vice-president, Wm. J. McDermott.
Recording secretary, Henry J. Pattison.
Financial secretary, Thos. J. Cummins.
Treasurer, Jas. N. Knight.
Marshal, John C. Starck.
Sergeant-at arms, Chas. Kranichfelt.
Trustees, James Gilroy, Thomas J. Tuomey, Jonas A. Rossman, Thos. J. Cummins, Thos. F. Gaynor.

This is the third term for President Gabay, who is possessed of good executive ability and deservedly popular with his brother craftsmen, both of the New York and National associations.

Another Joint-Wiping Expedient.

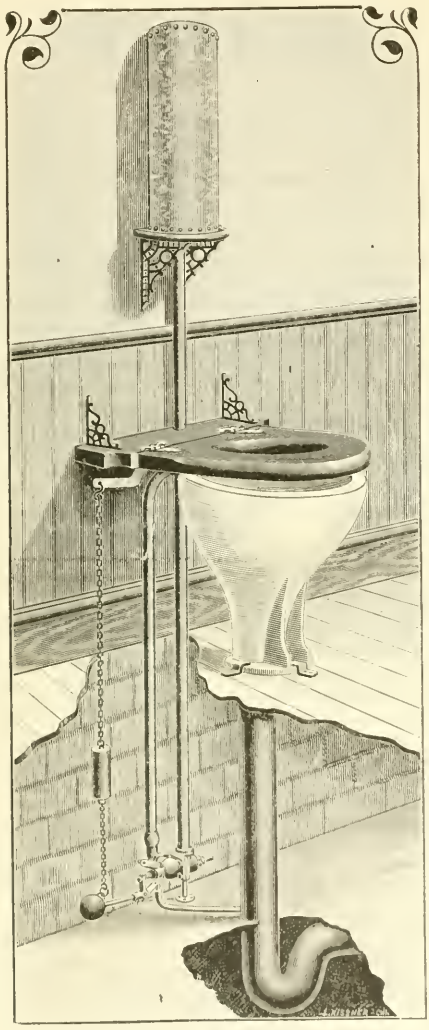
From F. F. D., *Dover, N. H.*—As we have to be governed by circumstances very often as to what method we shall use in doing a piece of work, I will describe an expedient I have used in a case similar to that mentioned by "A. L. R." in *The Metal Worker* of December 10, 1892.

A joint was to be made in a lead pipe leading from the water main to a dwelling house. As ice and salt were not handy, I cut the branch and plugged the end of the section attached to the water main, thus stopping the flow of water and then soldered over the plug. Then I replaced the bad pipe with good. The next thing was to connect the two sections. I made a short T on the end of the repaired part, the end of the T lapping over the part which had been plugged, and soldered the end of the T to the top of the plugged pipe. Then I inserted a bit into the T and bored a hole in the plugged pipe so that when I withdrew the bit the water flowed

out through the top of the T. It was only necessary then to place another plug in the top of the T and to solder over it, when the connection was completed.

The Kelly Frost-Proof Water Closet.

In the accompanying illustration we show a general view of the Kelly self acting after flush frost-proof water closet, manufactured by Thomas Kelly & Brothers, 123 Franklin street, Chicago. The chief claim made for this closet is that there is no water remaining in any part above the freezing point. When the seat is pressed down, the tank, which can be set at any desired hight, fills with water so far as the pressure will compress the air in the tank, with, it is said, force enough to clear the closet and sewer. We understand that these closets have given much satisfaction during the recent cold weather in the Northwest.



The Kelly Frost-Proof Water Closet.

The Setting of Flush Rim Water Closets.

From Y. P., *Camden, N. J.*—What is the best way to set flushing rim hopper closets? I was sent to put in two closets of the short hopper and iron trap pattern in a private house last week, and put them up in the same way as the foreman used to set them where I learned my trade. The owner now complains to my boss that they do not work satisfactorily; that the flush does not strike them in the proper place and that the back of the bowl is always filthy. How can I improve on the work.

Answer.—There should be no trouble in setting a hopper closet if a young man exercises his intelligence. The common practice is to run the 1½ inch flush pipe down over back of closet seat so that the flush will come down with an unimpeded rush. A little observation will show that the force of the flush, under this arrangement is directed toward the front of the inside of the closet bowl, which does not need it as much as the back part. If in setting the bowl the inlet for flush pipe were set nearly in front the desired object would be accomplished, for the full force of the stream would be thrown on the back of the bowl. To do this it is only necessary that the flush pipe, after it gets below the closet seat at the back, be carried round under the seat so as to make the connection as near the front as possible. If our correspondent tries the effect of the above plan he will find it to work all right and give satisfaction.

New York Trade Schools.

The Trade School Committee of the Master Plumbers' Association visited the schools on Wednesday, January 18, for the purpose of making the acquaintance of the students of the day class in plumbing. The members of the committee present were Edward Murphy, Frank Reynolds and T. J. Toumey. They arrived at the schools about three o'clock and spent an hour in examining the work that the students had done since the commencement of the term. When the closing hour arrived, the class was assembled in the lecture room of the schools and Mr. Brill, the secretary, introduced the members of the committee, each of whom made a few appropriate remarks. Mr. Murphy also distributed a book on plumbing, a gift to each of the students from Colonel Auchmuty.

The Position of the Plumber.

From H. S. & D., *Charleston, W. Va.*, —"In New York the art and mystery of plumbing is taught in the public manual training school. Graduates will be enabled to make an intelligent kick, even though they may not attain sufficient skill to do their own robbing."—*Minneapolis Tribune.*

The above clipping is quite too old a "chestnut" to merit any comment. We regard it due the craft and to our workmen, as well as plumbers in general, to express resentment to the alleged greed of a useful and intelligent class of skilled mechanics.

We desire to call attention to one fact that was apparent to our citizens and probably those of many other towns during the week before last—namely, that the only mechanics seen on the streets going to work during this unprecedented cold spell were plumbers.

Realizing that a temperature of zero to 20° below would shut off the water supply of hundreds of dwellings and bring actual suffering to many households, and thereby create a demand for relief much beyond the combined ability of all the plumbing shops in the city to meet, we suspended all new work and placed our entire force, including every member of the firm, on repair work. When our shop doors were opened at 7 a.m. Monday morning the telephone was ringing. In a few hours we had as many calls as we could respond to in a week. They came by telephone, by mail, by messengers, by customers in person, each and every one was urgent. It was no time to banter or cavil about prices, but a time to act. Before the week closed our call list resembled an application for an important post office.

Every man in our employ reported promptly each morning during the week and without a single exception went out without a murmur or a word of objection, no matter how cold or stormy the weather,

to do his utmost to relieve the pressing necessities of our customers. We did what we could, working early and late at night and in one case all night. Everywhere our men were gladly welcomed.

Knowing by actual experience the exceeding discomfort of handling tools and frozen pipes in biting cold air, we felt it not unjust to make a moderate advance on our usual prices for repairs.

If any reader of this wishes to know what a pleasant job such work is let him with wet hands handle a wrench or pipe tongs where the thermometer is ranging near zero. It may appear simple enough, but continue it for a single hour and then tell us how you like the work the plumber has to do to repair your burst pipes and this most frequently in rooms where a fire is not only impracticable but absolutely dangerous. You may think he can protect his hands with gloves or that wet hands are avoidable. If so take down a pipe frozen full of ice and see how long your hands will remain dry.

Believing that a mechanic who possesses sufficient pluck to continue at his work while all other mechanics are sitting at their firesides or mingling with the throng in the well-warmed corridors at the capitol, or possibly lounging at the saloon or billiard room, to be justly entitled to liberal pay, we voluntarily added one-fourth to the regular week's wages of every mechanic and helper in our employ Saturday evening.

If $2.50 to $4 per hour is not too much for the hire of a single horse and sleigh (actual prices charged here), we believe we shall not stand unjustified for paying our men a similar sum for a full day's labor and charging a like advance to those of our customers who had the benefit of their services.

We venture to assert that among the scores of patrons served by us during the week none will find occasion to complain of excessive charges or robbery. The facts and experiences of one week in a plumbing shop we have but very faintly portrayed. Our experience was doubtless just like that of plumbers all over the country. We believe the plumber to be the peer of any craftsman, and while he works at the trade or follows the business for the money there is in it, he gets no more for his services than those who are his equal in skill and intelligence. We think the time has come when he should no longer be made the object of dirty flings or classed among robbers. What other craft is there that can say one-half as much to the credit of their workmen?

TRAPS AND VENTS.

A LAW WAS PASSED by the New York State Legislature last winter, says our Albany correspondent, creating a board of examining plumbers in cities throughout the State, and at Albany a small appropriation was made in the last annual budget to enable the plumbing board to begin its work. The law says that on or before March 1, 1893, every employing or master plumber is to register at the office of the local Board of Health, if holding a certificate granted by the examining board. It is the opinion of the Albany plumbers that the law will do much to raise the standard of work, allowing only those thoroughly qualified to become master plumbers. The local board has been assigned rooms in the City Hall by the Mayor. There such simple apparatus and material will be on hand as may be needful in having the candidate practically demonstrate that his knowledge is sufficient to enable him to do such work as he professes. By this means he will show what he knows about the various branches of plumbing. The local board have already organized, and chosen City Engineer Andrews, who is a member by virtue of his office, president. William J. Halpen has been elected clerk. The other members of the examining board are: J. Edward Jones, D. H. McCormick, H. F. Wescott and Inspector of Plumbing Gorman of the Health Board.

JOHN E. HARRISON has been appointed plumbing inspector for the board of plumbers of Schnectady, N. Y.

ANDREW GREEN AND ALLEN L. HENRY of Nyack, N. Y., have formed a copartnership in the plumbing business under the firm name of Green & Henry. They are both experienced men in the plumbing line.

M. S. DIXEY of Philadelphia, Pa., has been awarded the following contracts on the new barracks to be built at Plattsburg, N. Y., by the Government: Plumbing officers' quarters, $8400; plumbing barracks, $6400; plumbing mess house, $1900; gas piping quarters, $560; gas piping barracks, $150; gas piping guard house, $35; gas piping mess hall, $55. Babcock & O'Donnell of Syracuse, N. Y., will do the guard house plumbing for $1032. Ban & Creeman, Rochester, N. Y., will put in the steam heating apparatus for $7210, and Bramhall, Deane & Co., New York, the cooking apparatus for $3000.

THE TORONTO STEEL CLAD BATH & METAL COMPANY, LIMITED, send out a New Year's greeting, announcing to their friends and patrons that they have improved their facilities for the manufacture of the steel-clad baths and can produce them with greater dispatch and better satisfaction than heretofore. This announcement is printed on a card, the back of which carries an illustration of the bath.

PECK BROS. & Co., plumbers' supplies, 259 Wabash avenue, Chicago, have secured the services of M. H. Hogle, who will represent the firm on the road the coming season. Mr. Hogle was formerly connected with the National Tube Works Company.

Standard Gauge for Sheets.

(*From Our Washington Correspondent.*)

The friends of the bill to establish a standard gauge for sheet and plate iron, both on the Committee on Coinage, Weights and Measures, and in the House, feel much encouraged at the prospects of action. The committee have authorized a favorable report on the Stone bill, and an effort will be made to have the Committee on Rules fix a day for its consideration.

There is no reason for opposition in the House other than the narrow notions of a few hide-bound partisans, who seem to mix up everything in the line of national legislation to secure uniformity in all the States as an infringement on State rights.

John Jarrett and C. H. Kauffman are in Washington enlightening legislators who wish to be enlightened on the advantage of establishing a standard gauge as proposed.

Mr. Jarrett says the "benefits to follow from the fixing of a standard weight and thickness for the sheets and plates of iron and steel are many. Take 28 gauge. Some manufacturers make it 8 ounces and others 10 ounces to the square foot. What we want is a uniform standard, as follows: Take a square foot of iron, 1 inch thick, weighing 640 ounces as the basis of calculation. From that uniform thickness and weight we can easily calculate the exact weight of the different thicknesses. The establishment of a uniform standard will be an advantage to the wage worker, the manufacturer and the consumer. The scale which has been submitted differs slightly from the English gauge, but we think the American standard is better, as it is based upon simpler rules and more scientific adjustment of size and weight."

New York Hardware Dinner.

We give below an important official announcement of the Dinner Committee of the Hardware Club, who are making arrangements for the trade dinner, February 21. It is especially desired that at this gathering there be a general representation of the trade at large, manufacturers and merchants, whether residing in New York, its vicinity or other parts of the country. As it would be a matter of very considerable difficulty to send special invitations to all the members of the trade who would be welcomed at the dinner, the committee by the publication of the announcement given below extend an invitation to manufacturers and merchants in Hardware and related lines, in view of which all who desire to attend will feel free to do so. It is hoped that there will be a large attendance of the manufacturing interests in this line, and it would be an especial pleasure if at the dinner there might be a goodly number of prominent Hardwaremen from other cities. The following is the official announcement of the committee:

FIFTH DINNER
OF THE
HARDWARE AND METAL TRADES.

RECEPTION, 6 TO 7 O'CLOCK; DINNER 7 O'CLOCK.

The fifth dinner of the Hardware and Metal Trades will be held under the auspices of the Hardware Club of New York, in the Banquet Hall of the Manhattan Athletic Club, Madison avenue and Forty-fifth street, on Tuesday evening, February 21.

We are under obligations to the officers of the Manhattan Club for the courtesy of extending to our guests the privilege of inspecting their magnificent building in all its departments during the evening.

We are not issuing individual invitations, but all merchants and manufacturers in Hardware and related lines are hereby cordially invited to attend the dinner, which it is hoped will be a thoroughly representative gathering of the trade in all parts of the country.

Tickets, $5 each (wines à la carte), can be had from A. D. Clinch of Underhill, Clinch & Co., 94 Chambers street.

The demand for tickets for the dinner of 1892 exceeded the supply, and it is hoped that applications for tickets this year will be sent in early, as the issue will be limited, so as not to exceed the comfortable seating capacity of the hall.

Dinner Committee:

ALFRED D. CLINCH, *Chairman.*
PETER MCCARTEE.
JOHN L. VARICK
EDWARD C. VAN GLAHN.
EUGENE BISSELL.

The imports of rubber into the United States in 1892 amounted to 34,300,000 pounds, principally from Brazil. This is a decline compared with the previous year.

Loss of Heat from Range Boilers.—II.

TEMPERATURE OF FIRE.

First, then, we will say that the effective temperature of fire in contact with the water back must be considerably below 1100°, which is probably true, and it may be, say, 750° to 800°. But as this will decrease the heating capacity but 20 per cent., or from 230 gallons to 194 gallons per hour, there is still a large discrepancy, and we must look further for the cause. We know the calculation for conductivity to be correct, and the only other apparent source of error seems to be in assuming that the circulation was perfect. If, however, it be defective from any cause, the entire efficiency of the heating apparatus will be affected, as the very small amount of heating surface in proportion to the volume of water renders the storage portion of the apparatus a necessity; and unless it be kept in sufficiently rapid circulation to absorb the heat from the fire as rapidly as it can be transmitted by the material composing the heating surface, the capacity of the apparatus must be reduced in proportion as the circulation is defective.

For instance, if the circulation is sluggish, the water in water back will remain so nearly stationary as to allow it to become heated to a very much higher temperature than would be possible if it were being continually and rapidly displaced by the cooler water from the lower portion of the boiler, and the quantity of heat conveyed to the upper portion by this smaller quantity of hotter water will be much less than the conducting capacity of the water back due to the temperature of the fire. There are numerous causes which will affect the rapidity of circulation, and if one or more of these exist the result will be more or less unsatisfactory. The principle involved in this circulation by heat is the difference of specific gravity or weight of the water, due to the temperatures existing in the upper and lower levels of the boiler, or at the points at which the two connecting pipes are attached. The greater the difference of these temperatures, of course, the more rapid will be the circulation. It is important, therefore, that the inlet and outlet pipes connecting the water back and boiler be properly located with reference to this point. Should the upper or discharge connection from water back enter the boiler too low, it will have the effect of heating the lower stratum of water, and possibly to such an extent as to cause almost a complete equilibrium of temperatures (and consequently of specific gravities) at the two connections, and hence the circulation will be reduced, or entirely suspended, until such time as the necessary difference may be again established, and the circulation—instead of being continuous—becomes intermittent.

BOILER CONNECTIONS.

As the location of these connections in both boiler and water back is fixed by the manufacturer, the supposition is that they are correctly made, on rules derived from practical experience, and the matter is, therefore, beyond control of the plumber, except as to making correctly the connections between the two portions of the apparatus. In some cases the difficulty is due to a partial stoppage of the lower opening in the water back, from deposits of lime, scale, or rust caused by the water. This, of course, will only happen as an effect of continued use, and is not an inherent defect. It may be easily remedied by disconnecting the pipe at the union and cleaning out the deposit. Or it may be that the leaden pipes—one or both—may have become partially closed by being kinked or dented through carelessness. This, of course, would affect the circulation more or less, according to the amount of obstruction.

As we have found by our previous figures that the actual efficiency of the boiler is about 50 gallons per hour, it would seem that the circulation is only about one-half as rapid as would be necessary to utilize the full conducting power of the water back. Therefore the 194 gallons will be reduced to 97 gallons as the actual capacity. On this basis, then, we may figure the proportionate loss from exposure of the surface of boiler. As we have found the quantity of heat per gallon for the 64° between 100° and the initial temperature of the water to be 533.76 units, the quantity contained in the water heated per hour will be $533.76 \times 97 = 51774.72$ total heat units. The amount of loss from boiler being 4554 units, we have $4554 \div 51{,}775 = 0.088$, or 8 8 per cent. at 100°, or 13.2 per cent. at 150°.

Of course, the estimate of the amount of loss in efficiency of the heating portion of the apparatus, from defective circulation, is pure guesswork; but that it is but a very small percentage of the capacity due to temperature and conductivity of the water back has been very clearly demonstrated. If, however, the efficiency is correctly shown by the foregoing figures, the proportionate loss from the boiler becomes a matter of considerable importance, and the possible saving of a large percentage on this item may be the means of furnishing an additional supply of hot water sufficient to meet the existing deficiency. The quantity of water represented by the 4554 units of heat lost is $4554 \div 533.76$ = about 8½ gallons per hour. In the above calculations to ascertain the amount of this loss only the simple rules have been used, for the purpose of demonstrating the possibility of systematic investigation. As will be shown later, the actual loss is considerably greater than above, and consequently, the saving possible—though of the same percentage—will represent a larger quantity in the aggregate.

HEAT IN THE KITCHEN.

As to the effect of the diffusion of this quantity of heat upon the temperature of the atmosphere in room, we may calculate as follows: Suppose the room to be of dimensions 10 x 15 feet x 10 feet high = 1500 cubic feet. As 13.14 cubic feet of air at 62° F. weigh 1 pound, and the specific heat being 0.2379 (water being 1.0), the number of heat units contained in this volume for each degree of temperature will be $\frac{1500}{13.14} \times 0.2379 = 27.16$; and $\frac{4554}{27.16} = 167.7$. The heat lost by the boiler &c., in one hour will, therefore, be sufficient to raise the temperature 1°, of a volume of air 167.7 times as great as the capacity of room, or, say, of the single contained volume $\frac{167.7}{6} = 28°$ in ten minutes. Now, while this is very desirable for the purpose of assisting to maintain a comfortable temperature in cold weather, provided the heat given out by the range itself is insufficient, it is certainly not good economy to obtain the result at the expense of the necessary supply of hot water; while in summer it is a by no means inconsiderable addition to the discomfort of the occupants of the kitchen, though its effect on the water supply may be unimportant.

COVERING FOR BOILERS.

The jacketing of boilers and steam pipes is now considered indispensable in steam engineering practice and there does not appear to be any good reason why the same method should not be applied to domestic apparatus. Of course some modifications would be necessary as to the nature of the covering. It must be neat in appearance and cheap, as an unsightly or expensive covering would be out of the question. It should also be practically fire proof, or at least sufficiently so to prevent danger of ignition from the continued heat of the boiler. There are numerous materials which would be effective as non-conductors which possess the qualities mentioned. Hemp canvas, paper felt, wool felt, asbestos board, &c., are comparatively cheap and easily applied. They may also be made neat in appearance and are sufficiently durable to be considered permanent. As to their efficiency, let us see, for example, what effect the use of paper felt ¼ inch thick will have if the shell and heads be entirely covered by it.

We have seen that the loss from this metallic surface is entirely by radiation and contact of air. Conductivity is not considered, for the reason that so long as it is considerably more rapid than the loss from the former causes the equilibrium of temperature is maintained throughout the entire thickness of the metal, and the two surfaces, internal and external, are of the same temperature as the contained water. The loss from conduction (supposing the boiler to be entirely surrounded externally by water at a constant temperature of 65° instead of the air) would be $\frac{18\ 85 \text{ sq. feet}}{0.1 \text{ inch thickness}} \times 35° \times 233$ heat units = 1,537,217.5. By the previous calculation, the loss from the actually existing causes has been found as 717 heat units, therefore the relation between conduction and the combined effects of radiation and contact of air will be as 1,537,217 ÷ 717, or 2144 to 1. As these two sources of loss may be considered as, in reality, representing the conductivity of air, we may call the latter $\frac{1}{2144}$ or 0.00047, as compared with sheet iron as 1, under the given conditions. From this we see that air is the best of all non-conductors, for, although the above calculation cannot be taken as exactly correct, it is approximately so, and the result may be safely considered as illustrating the value of air as a non-conductor. It should be mentioned that the loss at higher temperatures, as shown by experiment, is considerably greater than where the difference does not exceed 20° or 30°. For instance, at 35° difference it will be 1.15 times as great as by the rule used in our first calculation, while from 212° to 60°, or 152° difference, it will be 1.65.

LOSS OF HEAT IN COVERED BOILERS.

As the calculation necessary to obtain the exact loss is somewhat complicated, it may be well to omit the details and use for our purpose the summaries only. Using the previous temperatures of 100° internal, 65° atmosphere = 35° difference; with boiler shell $\frac{1}{10}$ inch thick and 18.85 square feet external surface the actual loss for the naked boiler will be 62.07 heat units per square foot, and $62.07 \times 18.85 = 1170$ heat units total. This loss as compared with that of a felt covering ¼ inch thick is as 2.16 to 1. Therefore $\frac{62.07}{2\ 16} = 28.7$ units per square foot, or $\frac{1170}{2.16} = 541.7$ units total, and $1170 - 541.7 = 628.3$, or 53.7 per cent., gain from use of covering. This gain may be still further increased by leaving an air space between the boiler and covering of, say, ¼ inch. The ratio will then be as about 0.75 to 1, or $541.7 \times 0.75 = 406.27$ heat units total loss, and the total saving from ¼ inch air space and ¼ inch felt $(1170 - 406.27) \div 1170 = 0.653$, or 65.3 per cent. of the loss by naked boiler. With thicker material composing the jacket the saving will be proportion-

ately greater. For instance, while for ¼ inch the ratio of loss is as 1 to 2.16, for 1 inch it is as 1 to 5.5. The latter, however, would probably be objectionable on account of its cost, and also for other reasons, but the same does not apply to the thinner material mentioned.

Of course there are many feasible methods for accomplishing the insulation of the boiler which are inexpensive and otherwise unobjectionable and there is no doubt as to the fact that many boilers which at present are totally inadequate may by this means be made to furnish an ample supply of water at all times when there is an average fire in the range. The lead pipes, having a comparatively unimportant share in the loss of heat, may be neglected, particularly as the usual arrangement of those that are exposed is such as to render the covering both inconvenient and comparatively expensive.

While the foregoing deductions are necessarily based upon hypothetical conditions, they may be regarded as very closely approximating those actually existing. Their purpose, however, is not so much for the ascertaining of exact quantities as it is the suggestion of an intelligent method of investigation as to causes of such defects—in other words, the diagnosis which must precede the prescription of an efficient remedy. While there are many boilers to which our remarks do not apply—as they are of ample efficiency—it is safe to assert that they are in a very small minority, and that by far the greater number stand in need of improvement as suggested.

The New York State prison industries are referred to by Superintendent Lathrop in his annual report, and evidence is afforded that an effort has been made to conform to the requirements of the new law regulating labor. He has endeavored to select such industries as would make the smallest competition with free labor, and to find such employment for the men as would be educational and would in a fair degree fit them for employment and self-support after release. The operation of industries which have been selected and established has not been stable. New laws have required changes. For obvious reasons this course has been attended with loss of power and income. The number of men employed is over 2000, or nearly three fifths of the entire number confined. To lessen competition still further the labor societies desire to abolish machinery. It would appear that labor has been more profitably employed than was expected, as nearly one-half of the $500,000 appropriated for its prosecution was turned into the State treasury.

J. Y. McClintock, City Surveyor of Rochester, N. Y., has furnished to the *Engineering News* some interesting data to show the effect of corrosion by locomotive gases on an overhead bridge. The bridge in question carries East Main street over the main tracks of the New York Central & Hudson River Railroad at the west end of the company's freight yard in East Rochester. The bridge is 112 feet 1 inch long, and its top and bottom chords of the triangular truss are made up of angles and webs. The bridge was built in 1879, and in August of last year, after 13 years' use, measurements were taken to ascertain the effect of corrosion. The measurements covered a number of angles, and showed a decrease in section varying from 25.9 to 61.5 per cent., it being over 40 per cent. in most of the angles measured. The web plates exhibited similar loss of metal.

For $100,000 J. M. Shenk and Thomas Evans purchased a controlling interest in the Lebanon Iron Works.

Weekly Prize Competitions.

$25.00.

FOR MORE THAN six months Weekly Prize Competitions ($10) have been an interesting and useful feature of the *Pharmaceutical Record*, a journal issued from this office and devoted to the interests of the drug trade. These weekly competitions have related to a variety of technical and business questions of interest to druggists, and have brought out a large amount of information of much service to the readers of that enterprising journal. In view of the success of this feature we have decided to announce a similar series of Weekly Prize Competitions on questions of interest to our readers, and invite a general participation on the part of the trade. As the object of these competitions is to obtain information which will be of practical service to our readers, and to discuss questions in which they are interested, we shall esteem it a special favor if any in the trade will suggest subjects for such competitions, which, if deemed suitable, we shall take pleasure in using.

In each competition there will be three prizes—a first prize of $12.50, a second prize of $7.50 and a third prize of $5. The prizes will be awarded for the answers which in the judgment of the committee of award are most suitable for publication and of the most general interest. These competitions are open to every one, and it is hoped that there will be a general response from business men. Those intending to compete are reminded that it will not be necessary to write long essays, but that comparatively brief and business-like answers to the different questions will be favorably regarded as meeting the purpose for which these competitions are announced. We shall have the privilege of publishing any or all of the contributions received.

Weekly Prize Competition No. 3.

SUBJECT:

Waste in the Store and How to Avoid It.

This subject is given at the suggestion of a practical Hardwareman, who writes as follows:

I have noticed with pleasure the different subjects for competitions as they have been announced, and am satisfied that a good deal of matter interesting to merchants will be brought out. Permit me to suggest as a subject that might with advantage be ventilated, the matter of leakages in business. There are many ways in which profits may be seriously diminished as the result of carelessness, and the proprietor be at a loss to account for their disappearance. Among the ways this may happen are: Over-weight and over-measure; wasteful use of paper and twine; unnecessary burning of lights; giving away small articles or small quantities when customers would willingly pay for them; abuse or damaging of stock, and the cutting of prices of goods by employees to particular friends. The subject seems to me to be an important one, and if you should see fit to lay it before the trade it is probable that some of your enterprising correspondents will be able to suggest other leakages and how this kind of waste is to be avoided.

The above letter describes in general terms the scope of the competition, and we invite a full discussion on the subject.

The following prizes will be awarded:

First prize	$12.50
Second prize	7.50
Third prize	5.00

Replies are to be received not later than February 18, 1893. They should be addressed as follows:

DAVID WILLIAMS,
96–102 *Reade street,*
New York.
Weekly Prize Competition No. 2.

The Weekly Prize Competitions noted below are now before our readers and remain open until the dates named:

No. 1. Closing February 4.
How to Avoid the Accumulation of Dead Stock.

No. 2. Closing February 11.
How to Keep the Store Neat and Clean.

No. 3. Closing February 18.
Waste in the Store and How to Avoid It.

Another subject will be announced in our next issue.

Our readers are also reminded of the following Prize Competitions, announced on another page, in each of which four prizes, of $50, $25, $15 and $10, are awarded:

No. 6. Closing February 18.
How Retailers Can Best Advertise and Extend Their Business.

No. 7. Closing February 18.
Travelers' Yarns.

No. 8. Closing February 18.
How to Treat Clerks.

No. 9. Closing February 18.
Shop System of Keeping Track of Jobs.

No. 10. Closing February 18.
Business Maxims—At Least 10.

No. 11. Closing February 18.
How Small Retailers May Keep a Record of Prices.

The designs for two bridges to be built across the East River by the East River Bridge Company were approved by the Secretary of War with this single modification, that the hight of the lower span of the roadway shall be raised at its center 140 feet above mean low water, which is 5 feet higher than that of the bridge now existing. The Maritime Exchange and some of the pilots advocated 150 to 160 feet as the necessary hight, and the Secretary of War accepted a compromise. At least half a dozen ships have lost their topmasts while going under the East River Bridge, and for this reason warehouse property is more valuable if situated below the structure.

Governor Flower has appointed Thomas J. Dowling Commissioner of the Bureau of Labor Statistics in place of Charles F. Peck. Mr. Dowling was formerly President of the State Workingmen's Assembly. He is a blacksmith by trade, and at one time lived in Brooklyn. He has since lived in Albany.

THE TIN SHOP.

Triangulation in Pattern Cutting.—XVIII.

By Triangle.

PATTERN FOR THE FRUSTUM OF AN OBLIQUE PYRAMID HAVING SQUARE BASE AND TOP.

In Fig. 137, plan A, let F G H E be the plan of the base and J K L M the plan of the top of frustum, above which is shown the elevation of side E′ J′ M′ H′, corresponding to the side shown in plan by E J M H. In elevation B, F″ K″ J″ E″ shows the side represented in plan B by F K J E. While the elevations only show two sides, the slant hight of the four sides is given, which gives us the means of describing the patterns, in connection with the measurements to be derived from either plan. The operation of obtaining the four patterns is rendered much more simple and easy by placing the T-square at right angles to the base lines of elevations A and B and dropping lines from the points in elevations through the plans (which are drawn under and in line with the elevations), indefinitely. For the pattern of E J M H of plan A, we would place the T-square parallel with line E H of plan, and at any convenient point draw the line *j m* of pattern No. 1, cutting the lines dropped through J M of plan. From *b*, set off the distance *b h*, equal to the slant hight of side, as shown by J″ E″ in elevation B. Then draw *h e*, which connects the lines dropped through the points H and E in plan A. By drawing lines through the points *e j m h*, we have the pattern for part of article shown on pla by E J M H. The remaining patterns are obtained in a similar manner. In pattern No. 2, *g c* represents the slant hight K″ F″ of elevation B. In pattern No. 3, *f n* is derived from the slant hight E′ J′ of elevation A, and *g o*, of pattern No. 4, is derived from H′ M′ of the same elevation. It will be observed that the letters in patterns correspond with letters in plan representing the part of article for which the pattern is intended.

We will now proceed to describe the pattern by triangulation, and for this purpose we can construct a diagram of triangles showing the length of miter lines and the distances from points in the top to points in the base. In order to avoid confusion of lines we have constructed two diagrams of triangles, as shown in Figs. 138 and 139. For the diagram in Fig. 138, at any convenient point draw X W, in length equal to A J of elevation A, and lay off W E at right angles to it. Let X represent all points in the square, which is the plan of the top of the article. Lay off from W the distance from points in the plan of top to the corresponding points in the plan of the base. Thus, make W-E J equal to E J of the plan, W H M equal to H M, W-F K equal to F K, &c. Draw the radial lines E J X, H M X, &c. In a like manner construct a corresponding diagram, as shown by Z Y J in Fig. 139, using for the spaces in J Y the length of the diagonal or dotted lines between the plan of top and base in Fig. 141, and connecting the points in J Y with Z. By means of these two sets of lines, converging at X and Z respectively, we have the actual dimensions of the triangles into

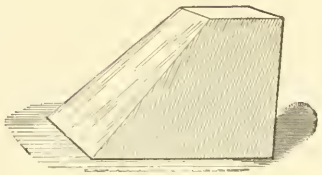


Fig. 136.—View of the Finished Article.

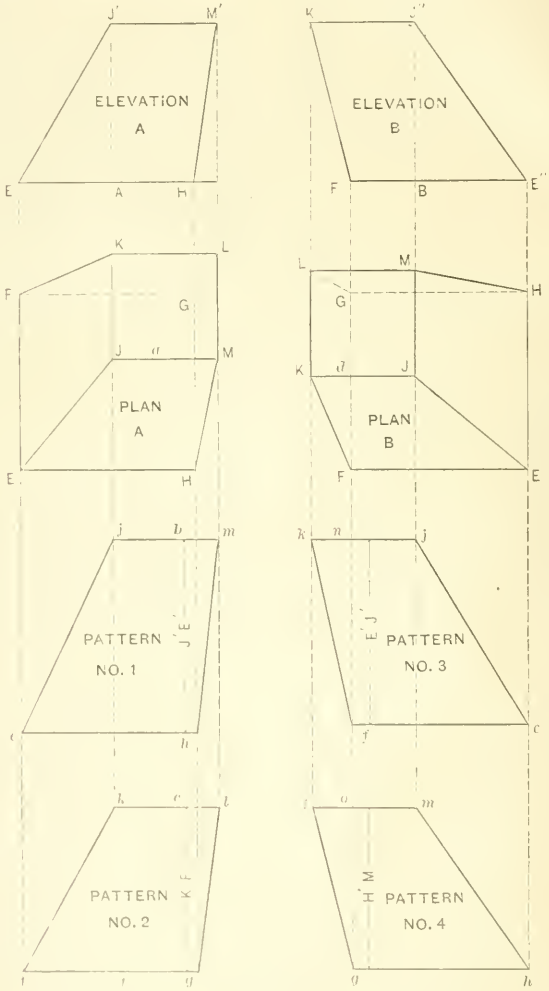

Fig. 137.—Patterns Obtained from Plans and Elevations.

PATTERN FOR AN OBLIQUE PYRAMID.

which we have imagined the surface of the article to be divided. On the duplicate plan in Fig. 140 is shown the triangles similar to those in Fig. 138, drawn on the solid lines in plan, and on the duplicate plan in Fig. 141 is shown the triangles drawn on the diagonal dotted lines. For the pattern in Fig. 142 the line E″ *j*″ can be drawn the length indicated by E J-X in Fig. 138, or equal to E *j* in Fig. 140. For the pattern it is necessary to obtain the length or distance from the point E of plan to the point J of top, as it could be measured on the finished article; this distance is given by either E J-X in Fig. 138 or by E *j* in Fig. 140. The part of pattern lying to the right of line E′ *j*″ will be completed by the use of the diagrams in Figs. 138 and 139, and the plan in Fig. 140. With E″ of pattern as cen-

ter and E H of plan as radius, describe an arc (H″), which intersect with a second arc struck from j'' as center, with radius J′ H′-Z of Fig. 139, thus establishing the point H″ of pattern. Then with H M-X of Fig. 138 as radius, with H″ of pattern as center, describe an arc, which cut with another arc struck from j'' of pattern as center, and J M of plan as radius, thus locating the point m'' of pattern. The point G° of pattern is struck from H″ as center, with H G of plan as radius, and from m'' as center, and M′ G′-Z of Fig. 139 as radius. With G° as center, and G L-X of Fig. 138 as radius, describe an arc, which intersect with one struck from m'' as center and M L of plan as radius. Lines traced through the points thus obtained will form the part of pattern shown by E″ H″ G° l'' m'' j''.

To illustrate the use of the triangles drawn on plans, we will describe the remaining part of pattern, which is located to the left of the line E″ j', by the triangles and plans in Figs. 140 and 141. These triangles could be drawn on one plan, but we have drawn them on duplicate plans to avoid confusion of lines. The length E″ F″ of pattern is established by the length E F of plan. The length from j'' to F″ of pattern is obtained from F′ $j°$ in Fig. 141. The distance F k'' of pattern is obtained from F k in Fig. 140, as is the length J K, represented by j'' k'' of pattern. The distance G″ k'' of pattern is obtained from K′ $g°$ of Fig. 141, while the remaining distances in pattern, as G″ l'' and k'' l'', are obtained from G l and K L in Fig. 140.

PATTERN FOR AN OBLIQUE PYRAMID.

Barstow & Kimball, Grand Rapids, Mich., issue a neat little illustrated circular and price list relating to Kimball's Pipe Joint Delineator, a device that was illustrated and described in *The Metal Worker* some time ago. The cuts show the delineator open and closed, and a description is presented of its method of operation and the various applications to which it is adapted. Full tables of sizes and prices are likewise given. A list of purchasers is also printed, showing some of those who have used the delineator and to whom reference is made.

The injury done by destroying the forests is not in lessening the total rainfall, but in producing the unequal flow of the streams. The trees, by preventing rapid evaporation, keep the falling snow and the moisture from heavy rains under their shadow for a much longer period, so that instead of heavy freshets, soon followed by drought, there would be, if the forests were standing, a steadier supply of flowing water.

Some of the residents at Homestead talk of persuading Carnegie to "let up" on the proceedings against alleged rioters and conspirators, as though he could condone offenses against the State. Do they comprehend the gravity of the charges that they must refute?

ROOFING AND CORNICE.

Pressed-Zinc Work.

"A correspondent sends us the following inquiry. "Please publish a method for making pressed-zinc work, such as egg and dart molding, scrolls, &c. I have seen a press made of two pieces of wood, 2 x 4 inches, standing upright, with the male die sliding up and down between two guides, and the female die resting on a work, it is proper to remark, in this connection, that it does not pay to set up an outfit for stamped-zinc work where only a small quantity is required. Any variety of designs can be obtained from manufacturers of pressed-zinc work, the prices being so moderate that the labor involved in making the castings sometimes costs more than the stamped article itself. This correspondent desires to know how to pre pare the castings for pressed ornaments, such as egg and dart moldings, scrolls, &c. As the method employed is the same, a different ornament has been chosen. Let us assume that a number of rosettes were required in the panels of some cornice work. In Fig. 1 is shown a front and sectional view of a pressed-zinc rosette, the panel being made of galvanized iron, and the ball B and the flutes A being pressed of sheet zinc and tacked with solder inside of the panel as shown. Fig. 2 represents an enlarged front and sectional view of the ball shown in Fig. 1; to obtain the pattern for this ball proceed as follows: Divide the section of the ball shown in Fig. 2 into a number of equal parts, as shown. Now draw any horizontal line, as shown by A B, Fig. 3, upon which place the stretchout of the section shown in Fig. 2; through the center of the stretchout draw a line at right angles to A B, as shown; then taking one half of the stretchout in the dividers as radius, strike a circle as shown by 1 9. Now set the dividers to 1 inch more

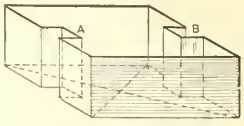

Fig. 8.—Sheet Metal Flanges Bent for Sliding Dies.

PRESSED ZINC WORK.

block of wood and fastened in place with screws. What I want to know is what kind of clay to use to make the model, and where I can get it, and after the model is made and the impression is taken in plaster of paris, how to cast the zinc dies. Also, is the plaster mold shellacked before making the zinc cast and what is the object of shellacking? In fact, I would like to know all about such work."

The following extensive answer to our correspondent's inquiry has been prepared by a practical sheet metal man, who has experience in this particular work:

Before describing two of the methods employed for obtaining pressed zinc radius, and strike circle as shown by A B. Then will A 9 and 1 B represent the allowance for a flange around the bottom of the ball. Six notches are made on circle as shown by C, D, E, F, G and H, in Fig. 3; these notches overlap each other in stamping and give a smooth surface. Having now drawn the shape and pattern of the ball, we are ready for the clay model. The clay used is known as modelers' clay, and can be obtained from dealers in such supplies. In Fig. 4 is shown a reverse profile of ball with pin attached, for developing a ball in clay. O represents a portion of a wooden board or bench, A a heavy piece of sheet metal, B

a wire nail of the required length, the head of the nail being flattened at C, so as to solder to the reverse profile A exactly in the center, as shown. In practice the wire nail is driven into the board or bench, as shown at B, Fig. 4, so that the profile A still has play room to turn. The clay is placed around the center pin B until a little more than the required hight is obtained. Now slowly turn the profile A until the ball is developed. The profile and pin are now carefully removed, and the small opening made by the pin in the clay ball filled up. It is proper to remark here that the clay should always be kept moist in working, and in case an article was being modeled which could not be finished the of mucilage it is ready to cast. This must be done as quickly as possible, for the plaster hardens very rapidly. It is better to have too much plaster mixed than too little, for if the die was cast and it was found that more plaster was required, by the time the second mixture was ready the first would have hardened and a firm joint could not be obtained. After the plaster is cast into the die, shown in Fig. 5, and has become hard, the metal flange B is carefully loosened on the outside soldered joint and the nails drawn out of the board, when it will be found that the flange, on account of being oiled, can be taken off the plaster without doing any injury. It is the practice of some to cast cast made, which will look as shown at A, Fig. 7. The hight from P to H should be about 3 or 4 inches. Fig. 7 shows the male zinc die obtained as explained, and also shows the metal flange around it ready to cast the female die. If the flange used in Fig. 6 is taken off carefully it can be used again in Fig. 7, as the size of the die is the same. In putting on the flange B, Fig 7, be careful that the hight from the top of the ball to the top of the flange is not less than 3 to 4 inches. Close the joint between the flange and zinc mold with clay, as shown at D, Fig. 7. In casting the molten zinc on the male die care should be taken that the male die is cooled and covered with a coat of graphite or

Fig. 14.—Egg and Dart Molding.

PRESSED-ZINC WORK.

same day a moist rag should be laid over it, which will prevent the clay drying and cracking and keep it moist and in good working order. Let A, in Fig. 5, represent the half clay ball which was developed by the use of the reverse profile shown in Fig. 4. A metal flange, shown at B, is nailed on to the board, as shown at O O, to receive the plaster of paris. The hight of the flange above the top of the ball should be about 2 to 3 inches. When casting plaster models the plaster has a tendency to attach itself to any surface when drying. To prevent this take a little linseed oil, and with a small brush oil the entire inside of flange and board, it not being necessary to oil the clay. Now obtain an old can in which to mix the plaster of paris. Fill the can with as much water as would be required to fill the mold shown in Fig. 5, and gradually sprinkle the plaster of paris into it, always stirring the water so that the plaster will not form in a lump at the bottom of the can. When the plaster has the consistency the molten zinc directly upon the plaster of paris mold; before doing this, however, the plaster cast must be thoroughly dried out in an oven, or over a heated stove, for if the plaster cast is not thoroughly dried and the molten zinc is poured into it steam is formed, causing the zinc to blister and the plaster cast to crack. Let A, in Fig. 6, represent a plaster of paris die, thoroughly dried, around which is placed a metal flange, B, of black sheet iron. If any other than black iron were used, such as tin or galvanized iron, the molten zinc would attach itself to it and could not be loosened. Care should be taken in lapping the flange shown at C, Fig. 6, so as to obtain a tight fit. After the flange is placed on the plaster model cover the joint between flange and plaster with clay, as at D, to prevent any leakage of molten zinc.

Next cover the surface of the plaster mold with ordinary graphite or stove polish, which gives a smooth surface. The scrap or other zinc is then melted and the stove polish. Now cast the molten zinc in the mold shown in Fig. 7, and we have the male and female die ready to stamp the half balls.

If our correspondent desires to use upright posts for the male or female dies to slide upon, as he suggests, the flange would be bent as shown in Fig. 8, the grooves A and B being made of the same size as the uprights. This flange would have to be used in the work shown in Figs. 5, 6 and 7, the same as before explained. In doing stamped work, in a case in mind where perhaps from 30 to 50 leaves or balls were required, all that was used was a large block of wood about 3 feet high by 12 inches square, on which to place the dies, a small sized sledge hammer, a few pieces of hard wood, a pair of pliers, a can of water and a good fire in a furnace, made either of coke or charcoal, it not being necessary to adjust uprights for these few ornaments. In case hundreds of ornaments of different designs were required, then instead of constructing uprights of wood,

it would be well to obtain a drop hammer, as shown in part in Fig. 9. These drop hammers can be obtained from manufacturers of presses, dies, &c., the drop hammer being made to suit the force of the blow required. If a drop hammer was used, the zinc castings would have to be provided with a dovetail to fit into the dovetails shown at A and B, Fig. 9. Although other joints could be made on the hammer and block, the dovetail is about the best method that can be employed.

Now to explain the method of stamping balls without the use of the wooden uprights or the drop hammer. The number of balls required having been cut after the pattern shown in Fig. 3, a charcoal or coke fire is started in a furnace to heat the zinc. Put the wooden block in the right position, heat the male and female dies, then place a piece of zinc on the fire, care being taken not to burn it. To tell whether the zinc has the right heat, dip a stick of wood into the can of water and let a few drops of water fall on the zinc. If the metal has the required heat the drops of water will jump off at once. Take the zinc off the furnace with the pliers and place it on the heated female die, being careful to set the zinc exactly in the center, (leather gloves are useful for this to prevent burning the hands). Place the male die on the sheet. Take a slat of hard wood in the left hand and lay it on the die, and using the small sledge with the right hand, gradually drive the male into the female die. This operation would have to be performed two or three times, always heating the sheet, until the finished ball was obtained.

In Fig. 10 are shown the sections required to construct model shown in Fig. 11. Let A Fig. 10, represent the enlarged plan view of one of the flutes shown at A, Fig. 1. B, Fig. 10, is the side view or section of flute. Divide the plan view into sections, as shown by the lines C, D, E, F, G, H and J. The sections shown underneath the plan indicate the sections taken through the lines F, G, H, J; 2, 3 and 4 on side view represents the section through the lines C, D and E in plan. Having the sections now prepared, the model for the clay is made as follows: Let Fig. 11 represent the model prepared of sheet metal, ready for the clay Fig. 11 represents a board, on which a duplicate of the plan, shown in Fig. 10, is placed.

Upon the center line B C, Fig. 11, place the side view shown in Fig 10; on the line C, Fig. 11, place the section shown by 1, 5, 9, Fig. 10; on the line E D, Fig. 11, the section V U S, Fig. 10; on the line F G, Fig. 11, the section M N R, Fig. 10; on the line H I, Fig. 11, the section 1' 5' 9', Fig. 10; on the lines J X, B X and M X, Fig. 11, the section shown by 2 3 4, side view, Fig. 10. Now fill the metal model with clay, and smooth off even with the top of the sections. Place a flange around it and cast the plaster of paris, the same as explained for the balls. In Fig. 12 is shown the pattern for stamping the flute shown in Fig. 1. To obtain the pattern proceed as follows: Divide the outer and inner circles of sections shown in Fig. 10 into any number of equal parts, as shown. Now draw perpendicular line, as shown by A B, Fig. 12, and at right angles to A B draw the line C D, upon which lay off on each side of the center line A B the half of the stretchout of the outer circle of sections shown in Fig. 10, as shown by the small figures 1, 2, 3, 4, &c., in Fig. 12. Set one leg of the dividers on the point 5, and with 5 9 or 5 1 as radius, strike an arc, as shown by E F; make an allowance of 1 inch and strike another arc, as shown by H J. Measure the distance from 1 to 2, side view, Fig. 10, and lay it off on the line A B from 5 to 5, Fig. 12. At right angles to A B draw a line through the point 5, as shown by N O, Fig. 12, upon which place on each side of the center line A B the stretchout of the inner circle of sections shown in Fig. 10, as indicated by the small figures 1, 2, 3, 4, &c., in Fig. 12. From the points 1 and 9 on the line N O draw two lines tangent to the arc E F, as shown from 9 to 9 and 1 to 1, which will be the required pattern; make the same allowance on the lower part of the pattern as shown by H J and S. A notch is made from U to V to allow the zinc to overlap. In Figs. 13 and 14 are shown sketches of a right and left scroll and egg and dart molding. The cast zinc models would be made in the same manner as before described.

Another way of making pressed zinc work is as follows: After the plaster model has been obtained and partly dried, a coat or two of shellac is given to it, so as to make a smooth surface. It is then taken to the iron founder and an iron model cast. A flange of black sheet iron (not tin or galvanized) is placed around it, using the clay so as to stop any leakage of molten lead. After the flange is in position lead is cast into it. Several lead casts are made, for the lead being softer than the iron, when the male die is not laid properly on the female die the result is that the lead die becomes flattened and a new one is required. Cast zinc can be used in connection with the iron die with good results.

Sheet-Metal House Fronts.

The St. Paul Roofing & Cornice Works, St. Paul, Minn., have been very successful in the sale of their sheet-metal house fronts in various parts of the country. We are pleased to note that they have taken a very large order from Adams & Holler, contractors, of Camden, S. C., for the Burdell Block, in which are situated the offices of the Bank of Camden. The building is, we understand, one of the handsomest erected by this firm. These metal siding plates, which have been recently patented by C. D. Pruden, the manager of the St. Paul Roofing & Cornice Works, are very durable and of artistic design. In reference to the Burdell Block, the Charleston *News* says: "It is intended to be one of the handsomest buildings in the State. The front is to be of steel in imitation of stone and plate and cathedral glass, surmounted by a handsome steel cornice on which is 'Burdell Block 1892,' and just over the bank entrance on the corner 'Bank of Camden.' The same lettering will be seen on the corner on the south side of the block, which faces on Rutledge street. At the corner of Broad and Rutledge, a square tower of handsome design will be erected, which will be of the same material as the front, even having the glass windows on its four sides." We are informed that the architect specified the galvanized steel work, doors and frames, also cast iron work, plate and cathedral glass, all of which were supplied by the St. Paul Roofing & Cornice Works.

FLASHINGS.

In a Bridgeport, Conn., paper a very appreciative notice is given of Henry Beutelspacher, who does an extensive business in sheet-metal work, plumbing and gas fitting. Reference is made to special work he does in copper also.

The year 1892, according to one of our English exchanges, was the best in the slate trade which the quarries have had since 1876. The demand during the year was good and is likely to improve still further, as merchants have been for some time booking orders for future delivery. The output of slate will probably show a diminution, though not so great as in 1891, the returns in that year showing a decrease of over $250,000 in value. The supply cannot be readily increased owing to the very limited area of good slate rock and the time and expense required to open new quarries.

For the week ending Saturday, January 7, the aggregate shipments of slate from Slatington, so far as the *News* of that place was able to secure figures, included 34 cases of blackboards, 10 cases of school slate, 3 crates and 35 pieces of flagging and 524 squares of roofing slate. The shipments from Walnutport for the same period consisted of 95 squares of roofing slate, 4 cases of school slate and 4 crates of blackboard.

A pipe hanger for water conductors forms the basis of a patent granted on January 3 to Edward G. Minnemeyer of Peoria, Ill. The essential feature of this invention consists of a base formed with a flat-bearing surface, integral with which is provided a screw or spike for penetrating the surface upon which it is designed to be adjusted. There are also bifurcated-bearing arms shaped to conform with the usual pipes or down spouts, of a circumferential wire staple, held in connection with the support and designed to be twisted with its terminal ends together.

W. J. Burton & Co., 164 Barned street, West, Detroit, Mich., send us an attractive calendar for the new year. The card, measuring 11 x 14 inches, carries a panel picture representing an oriental interior, executed with remarkable fidelity to details. Above this is the name and address of the company and the statement that the firm manufacture cornices, ceilings, skylights, finials, shingles and give attention to slate, tin and steel roofing. The 12 leaves constituting the calendar proper are attached to the card below the panel picture and are printed in black upon a white ground. In addition to the days of the week and month, each sheet also gives the phases of the moon.

The citizens of Canton, Ohio, have appointed a committee to secure subscriptions to an increase of capital of the Canton Steel Roofing Company, with a view to retaining the company in Canton.

Geo. L Mesker & Co. of Evansville, Ind., who manufacture and erect Galvanized House Fronts and similar work, have recently occupied their new factory. It is a very handsome building, having a frontage of 310 feet and a width of 150 feet, and three stories in hight. It is said to be one of the largest sheet-metal buildings in the country.

The Cambridge City Punch, Shear & Roll Company of Cambridge City, Ind., are making a slitting and squaring shear which will cut metal up to 16 gauge. It has a 16 inch throat, an automatic holddown and rear and front gauges. The manufacturers state that owing to the peculiar construction of their machines they can make them with 16 or 18 inch throat so as to cut 12 to 16 iron or steel.

The Panama Railroad may yet be under American control, according to dispatches from Washington, depending on the success of negotiations said to have taken place between an agent of the Treasury Department and President Nunez of Bogota. The explanation is made that so many shares of the stock of the railroad are at the disposal of the receiver of the canal company that the Pacific Mail Steamship Company, backed by the Gould-Huntington interests, feel confident that in the end they will come into possession. The canal franchise having been forfeited, President Nunez is vested by the Congress of Colombia with full power of action.

"The Metal Worker" Competition in Skylight Pattern Cutting.

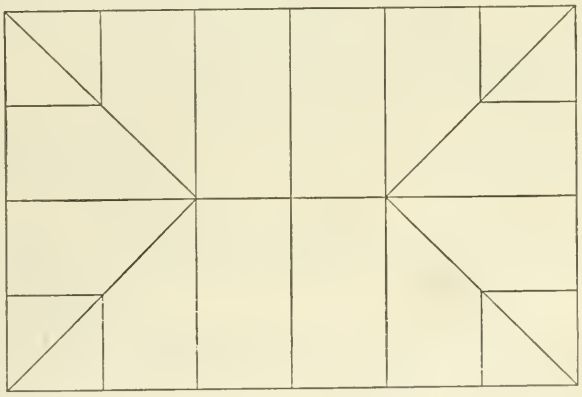
FOR the purpose of calling forth from the readers of *The Metal Worker* the best method for obtaining the patterns of a hipped sheet-metal skylight and to advance the art of pattern cutting, it has been decided to present a prize competition, the particulars of which are as follows :

Each contestant will be required to furnish the plans, elevations, necessary sections and profiles of skylight, also to design the various parts of same, giving to each part the shape that may be considered best adapted for the purpose ; drawings to be of such size as required for publication in *The Metal Worker*.

The skylight to be so constructed that the condensed moisture from below will be conveyed outside, the frame work of skylight to be made of sheet metal, and the usual thick glass to be used in connection with same ; the method of securing glass and caps to bars or rafters to be clearly shown.

While the plan may show a certain size of skylight, indicate the method by which one of similar pitch but different size can be constructed, the same miter patterns being used.

Show method of obtaining length of the various bars or rafters, using for the purpose any diagram, plan or elevation that may be necessary. Also show method of obtaining shape or section of hip bars.



Outline Plan of Skylight.

The skylight for which the patterns are required is such as would be placed over a light shaft, or on a roof or bulkhead, the size of opening being about 4 x 6 feet. As there is no particular rule governing the pitch of the skylight, it can be given such pitch as may be desired. While the wooden curb or frame of air shaft, roof or bulkhead is supposed to extend a sufficient distance above the roof to give ample opportunity for securing skylight to same, contestants will be at liberty to use such methods as appear best adapted for the purpose of fastening skylight, where brick and angle iron constitutes the frame.

The accompanying plan is not intended to give details of construction, but to indicate in a general way the shape of skylight for which drawings and patterns are required. Where there are two or more similar parts in the skylight, so that the pattern for one part will answer for the other, it will be only necessary to show details of one part. As indicated in plan, the skylight is to have a hipped roof, and as previously stated, the roof can be given any desired pitch.

PRIZES.

In the contest above described, two cash prizes are offered, as follows :

First prize.....$75.00.
Second prize..... 50.00.

The drawings and accompanying description may be sent by either mail or express, charges prepaid, and must reach the office of *The Metal Worker* not later than April 1, 1893.

They are to be addressed as follows :

THE METAL WORKER,
96–102 Reade street, New York.
(Skylight Competition.)

Each contestant is to select a fictitious name or device, which is to be placed on the description and each sheet of the drawings. The real name and address of the writer is to be put in a sealed envelope, on which is to be placed the fictitious name or device used on the drawings. This envelope is to be inclosed with the drawings and description.

The manuscript and drawings are to be sent flat, not rolled, and the writing should be on one side of the paper only. It is also suggested that legal cap paper be used for the description, the same size of paper for the drawings, and that ink be used for writing the descriptions ; the drawings to be either ink or pencil.

The various drawings and descriptions received up to the time set for closing the competition will be submitted to a committee selected for the purpose, who will decide between competitors.

In deciding between contestants, four points will be given consideration, as follows :

1. Originality.
2. Mechanical completeness of the method proposed.
3. Neatness of drawings submitted.
4. Clearness in description.

The right is reserved to publish all the drawings and descriptions received in this competition, and also to return to the authors the drawings and descriptions received in the competition in case they are not considered suitable for publication or worthy of an award of prizes.

THE LETTER BOX.

Another Country Problem.

From S. J., *Troy, N. Y.*—The apple problem in *The Metal Worker* puts me in mind of the farmer who had a square farm containing 1000 acres. The farmer had four sons and he wanted to give them each a farm and keep one for himself, so that all should be of equal size. Furthermore, he wanted his own farm in the center with his four sons around him. Now, the question is, how did he do it? I send this for the benefit of your correspondent who spent six cents for postage on the apple problem.

Note.—Our correspondent also inclosed an answer to this problem which we will print in a later issue. We trust in the meantime to receive solutions from other correspondents as the problem is an interesting one.

Fitting Up a Store.

The accompanying diagram of the floor plan of a store is submitted to our readers for suggestions as to the best manner of fitting it up. It is the design of our correspondent to handle builders' hardware, carpenters' tools, stoves and tinware. The room is 16 x 78 feet in size, with a 12 foot ceiling, and it is desired to so arrange it as to accommodate the largest quantity of goods in a convenient manner for handling. One section of shelving is 30 feet long, and extends from the floor to the ceiling, in which drawers or boxes will be put to accommodate shelf hardware. The size of the boxes and their arrangement are also questions requiring a solution. Doubtless many of our readers can make valuable suggestions covering these points, which, as a result of their experience, will be of much assistance to our correspondent. We shall be glad to hear from many of our readers.

Fitting Up a Store.

Cements and Soluble Glass.

From E. J. F., *New York.*—Can you give me any information on cements which can be used in filling space and in joining wood and iron, such as iron arms inclosed in a wooden shelf? How about soluble glass in connection with other light substances?

Answer.—The following receipt for fastening metal plates on wood might be useful: Melt together 6 parts of rosin and ½ part of linseed oil and stir into the melted mass 1 part of burnt ocher and ½ part of plaster of parts. Another cement for iron and wood is: Melt together 4 paris of black pitch and 1 of wax and stir 1 part of brickdust into the melted mass. The following information about soluble glass may be of interest: When finely pulverized chalk is stirred into a solution of soluble glass at 30° B. until the mixture is fine and plastic, a cement is obtained which will harden in six or eight hours, possessing extraordinary durability and alike applicable for domestic and industrial purposes. It might be used for uniting stone, brick, &c., and for filling up cracks. In short, it seems to be applicable to about the same purposes for which plaster of paris is used, but is much harder and stronger.

Trouble with Gas Range.

From G. R., *Mansfield, Pa.*—We have two gas ranges in different houses which are causing a great deal of trouble by reason of vapor gathering on the walls and ceilings, both upstairs and down. This seems to be a very common occurrence in burning natural gas in a range, and we desire to know what causes it and if there is any remedy for it. The walls and ceilings become so wet that the water runs from them. The rooms have plenty of ventilation and there are other fires in most of them, yet we cannot account for the trouble.

Answer.—This inquiry we thought warranted special treatment, so we submitted it to an expert in gas, who answers to the effect that natural gas contains a great deal of hydrogen, and that the pressure under which it burns permits the gas to escape and condensation occurs upon the walls. This explanation seems to us so inadequate that we endeavor to account for the phenomena in the following way: Natural gas, as has been noted, contains a very large amount of hydrogen in the form of what is known to chemists as "marsh" gas. This marsh gas composes over 90 per cent. of the volume of natural gas and is itself a compound of carbon and hydrogen, the latter being present in very large proportions. When the natural gas is burned the product from the marsh gas part of it is carbonic acid, which is the ordinary product of flame, and water, which is produced by the burning of hydrogen. So much hydrogen being present in the natural gas, it is a fair inference that a large amount of water must be given off from the flame. Of course, as the water is produced by combustion, it is in the form of a very thin vapor, which is carried up by the hot air, and only deposits when it strikes a relatively cold surface, such as the walls and ceiling of the room. Our correspondent mentions that the room has plenty of ventilation, but this expression is only a relative one. We have no doubt by running an exhaust blower, and drawing the air rapidly from the upper part of the room that the condensation would be avoided. We do not offer this as a practical suggestion, but simply to illustrate the fact that a forced ventilation would remove the difficulty. A better plan, we think, would be to connect the gas ranges with the chimneys, for we assume that they are not so connected at present. In this way the vapor would be carried up the chimney by the warm air, and probably would not deposit until it came to the outer atmosphere. It is the better plan in all cases to connect a fire with a chimney. This question of burning natural gas and the result of condensed water from it is an interesting one, and we wish that others in the West who have had experience in this line would give us an account of any similar trouble and what they have done to remedy it.

Preserving Tin Roofs.

From E. F. B., *Greenville, Pa.*—In *The Metal Worker* of January 7 I find quite a discussion on the subject of preserving tin roofs. With your permission, I would like to add the experience of 30 years' practice in this line. My advice in the matter is this: To begin with, a new tin roof should not be allowed to accumulate any rust before painting. I would recommend good Venetian red, mixed with good raw linseed oil and the best quality of asphaltum varnish for dryer, with a small quantity of turpentine, and the whole put through a paint mill and spread on with a fine brush smoothly. Let the first coat stand four weeks, then apply the second coat; let it stand six weeks; then apply the third coat. Cover the last coat with sand. The sand is applied by means of a funnel, which is used to shake it over the paint. Good sharp washed sand, thoroughly dried, should be used and should be sprinkled on the paint before the latter is dry.

Tinning Soldering Coppers.

From E. T., *Milwaukee, Wis.*—If one is to do a good job of soldering, especially on new work, it is necessary the coppers should be in the best of order. While most tinners and apprentices may agree with me regarding the above statement, how many take the time or trouble to have their coppers in proper condition for soldering? To tin coppers properly they should be first heated to a cherry red, when the old solder can be removed by means of a coarse file. If the points are too blunt or out of shape, draw them out, and while red hot plunge in cold water. This softens the metal so they can be

filed with ease. The coppers are then to be heated so they will just melt solder, then rubbed on a board with solder and rosin. If the coppers are too hot while being tinned they will not solder nicely. Sal-ammoniac is used by some in the place of rosin, but the result is not as satisfactory.

A New Use for "The Metal Worker."

From L. F., *Philadelphia.* — I have read your paper since 1881. I landed in New York City July 3 of that year and did not know one word of English, but by the aid of *The Metal Worker* I have translated my German into English—both trade and language. Every foreigner with the same trade can gain more English from *The Metal Worker* than any other paper I know of. I am not versed in English as well as I could be if I would take more pains, but I will endeavor, by the aid of your *Metal Worker*, to learn as I grow older.

Note.—The idea that *The Metal Worker* should ever come to be used as a text-book of the English language has never occurred to us. And yet there is a great deal of reasonableness in a foreigner who is familiar with the trades we represent studying his English by aid of the descriptions of the cuts. It treats of the subjects in which he is most interested and with which he is most familiar, and we can readily believe that it would prove an excellent text-book.

Alloying Zinc and Lead.

From F. & B., *Grand Rapids, Mich.*—Please let us know through the columns of *The Metal Worker* what will make lead and zinc mix?

Note.—Our correspondents' inquiry is very brief, but we presume they wish to know how to alloy the two metals, lead and zinc. Our answer must be equally brief, for to the best of our information there is no means of making these metals mix together. They will of course alloy in limited proportions, but so far as we know they cannot be compounded in the way that lead and tin or other alloying metals are mixed.

Size of Registers for Round Pipes.

From FURNACE.—One of the problems that confronts one in furnace work is to determine the size of floor registers to be used in connection with round heating pipes. Will the readers of *The Metal Worker* inform me what size of registers should be used with first-floor pipes, 9, 10 and 11 inches in diameter, or other sizes commonly used?

Russian Sheet Iron.

From W. C. R. K., *Orleans, Ind.*—What is known of the manufacture of Russia iron in Russia, and how do they manage to keep their secret, if it be such, from the outside world?

Answer.—The manufacture of Russian sheet iron is carried on almost exclusively in the Ural Mountains of Siberia. The furnaces and mills are in close proximity to mines yielding some of the richest ore in the world. All requisites for smelting it are found in quantities on the spot. The process of manufacture has been observed and described by several foreign visitors, as seen recently in a Siberian mill. It is briefly as follows: The pig iron is puddled immediately after it is put out from the furnace and made into blooms of 100 pounds to 200 pounds weight. Great care is taken to hammer the blooms well to get rid of all impurities under either a steam hammer or a tilt hammer. The blooms are at once reduced to bars 5 inches wide, which are cut into pieces 29 to 30 inches long, each piece representing a future sheet and varying thicknesses for sheets of different weights. Sheet iron in Russia is invariably made 4 feet 8 inches by 2 feet 4 inches and of all weights from 6 pounds to 20 pounds per sheet. The puddled bars are next heated in a charcoal furnace and rolled down into sheets by three separate operations. After having been examined and brushed the sheets are dipped in a bath of warm water, powdered with prepared charcoal, reheated for seven or eight hours, brushed with a wet fir broom, and then in bundles at a dark-red heat they are placed under a 15 hundred tilt hammer, which delivers over 200 blows to each bundle. Each sheet is then carefully examined on both sides, every speck of dirt being removed. The bundle is then made up again as before and reheated for an hour, after which the sheets are again put under the hammer, receiving 750 blows. This process is repeated six times, by which time they have received 3000 or 3500 blows. The bundle, after re-examination, is then handed to the finishers. By them the sheets are separately examined, and made up into bundles of 200, receiving, while cool, some 60 to 80 blows from a hammer on a cast-iron anvil. They are then "half-finished," and are allowed to cool over night. The next morning they are cut to size by hand shears, and treated by a polishing hammer, which delivers about 150 blows to each. Each sheet is afterward subjected to minute inspection, only about 50 per cent. being, as a rule, passed as No. 1—*i. e.*, those which are found to have an equal polish all over the sheet. The remainder are either classed as No. 2 or are rejected. The only secret—and it is a perfectly open one—is the great expenditure of time, care and labor in the manufacture. This, with the good ore and other natural advantages, is sufficient to account for the excellence of the material. The process above detailed occupied some 30 hours. Labor is abundant and the cost of it but slight. Some of it, we believe, is convict labor, which receives very little remuneration. Material is cheap and everything is in favor of the manufacturer.

Laying Tin Roofs.

From A. K., *Edon, Ohio.*—There is one thing I have noticed where tinners make a mistake in regard to roofing—when they lay too much to the contraction and expansion of the tin—for in most cases the trouble is due to the use of green lumber for sheeting. When I first came here the people told me there was no good tin roof in the country and it was hard work for me to convince them that I could put on one. I soon found out what the trouble was. Logs were cut green and hauled from the mill direct to the building and put right on and covered with tin, and instead of using heavy soldering coppers light ones were employed, and only the edge of the seam was soldered. Is it any wonder that such work did not stand? I advised the people differently and did good work by getting seasoned lumber for sheeting and soaking the seams thoroughly and the result was that I acquired a reputation for good work.

Against the Interchangeable Ticket.

Opposition has developed from an unexpected source to the scheme of a 5000-mile interchangeable railroad ticket. This has been a pet idea with the associations of traveling salesmen in the West. They have urged railroad companies to adopt such a ticket for the greater convenience of the traveling fraternity, and have worked up a tremendous volume of public sentiment on the subject, adding immense petitions to cogent and persuasive arguments such as traveling men know so well how to employ. So thoroughly had this work been done that success seemed almost within their grasp, favorable action being expected by the Western Passenger Association at the meeting in Chicago in March.

It was, of course, taken for granted that the employers of the traveling men were in favor of a movement which promised to save them some outlay for the traveling expenses of their representatives. But here is where the unexpected happens. The Minneapolis Jobbers' Association step in with the following communication to the Western Passenger Association:

In regard to the proposed 5000-mile interchangeable mileage ticket, to be considered by your association at its next regular meeting, our association has authorized me to state that we are emphatically opposed to the adoption of this ticket; and, in addition, will state that expressions on this subject from associations whose members employ and pay large sums of money to commercial travelers for railroad fare, &c., should have more weight before your body than the wishes of commercial travelers whose tickets cost them nothing.

This is a very severe blow to the project, and is quite likely to offset the very hard work done by the traveling salesmen in winning railroad managers to their way of thinking. If the men who pay for the traveling see no advantage to themselves in an interchangeable ticket, but are willing to continue to pay on the old basis, their representatives lose the strongest argument they have in support of the change they advocate. It will be observed that no reason is advanced for this opposition. It would be interesting to know what the reasons are for such apparently heroic self denial on the part of the jobbers, who do not ordinarily object to anything which promises economy in expenditures.

Enoch Washburn, a well-known dealer in stoves and tinware, died on the afternoon of January 12 at his residence in Orange, Mass. He had been engaged in business in that place for over half a century. He was a native of Rochester, Vt., but went to Orange from Templeton, which was then much the larger and more thriving place. He went to work in the tinshop of a Mr. Caswell or "Old Cæsar," as he was called, and after a time bought out his employer and became proprietor of the business, which he has since carried on. Mr. Washburn was something of a farmer as well as a merchant, and owned at the time of his death about 100 acres on the south side road to Athol.

The total receipts of the New York Post Office last year were $7,059,000, and the net revenue nearly $4,500,000.

WORLD'S FAIR NOTES.

Juries Will Judge.

Members of the Board of Control have decided that a system of juries of awards shall pass upon the merits of all exhibits displayed at the exposition. In reaching the decision the board adopted the report of the special committee consisting of George V. Massey, J. W. St. Clair and E. B. Martindale.

What promised to be a fight in the board over this question turned out in the end to be an amicable settlement of a perplexing question. Commissioner John Boyd Thacher of New York, chairman of the Executive Committee on Awards, had submitted a scheme for a system of expert individual judges to pass upon the merits of all exhibits. After wrestling with this system for nearly three months, the Board of Control finally decided to adopt what is known as the jury system. This means that the judges or examiners appointed to review each group of exhibits will as a body determine the points of excellence instead of accepting the opinion of one judge.

Mr. Thacher after a long conference with the board harmonized with this opinion and wrote a letter declaring that the modifications of his rules as adopted were perfectly satisfactory to himself. This means that they were satisfactory to the Committee on Awards. The following extracts from the committee's report cover the most important points:

Your committee having carefully considered the scheme of rules contained in the supplementary report of the Committee on Awards referred to it as last aforesaid is constrained to the conclusion that certain features of amendment thereto are essentially necessary to make them conform to the action of the commission, as well as to the requirements of the act of Congress, which, in the judgment of your committee, do not involve any radical revision, but simply more clearly define what your committee understands, after conference with the chairman of the Executive Committee on Awards, is intended to be the effect of the same when put in practical operation, and do not, moreover, so interfere with the general scheme of said committee as to deprive it of the characterization as an "American system."

It shall be the duty of each individual judge to make a report in writing over his own signature of the result of the examination of each exhibit primarily examined by him as each examination shall have been completed; and as to every exhibit so examined which he shall deem worthy of an award he shall formulate in words the specific points of excellence or advancement disclosed thereby, and which in his opinion renders it worthy of an award. Every report shall be submitted as soon as possible to the committee of which such judge is a member for a finding in the premises; and in every case where, by the vote of the majority of such committee, it is determined that an exhibit is worthy of receiving an award, said committee shall forthwith formulate in written words the specific points of excellence or advancement which, in his opinion, warrant the award, and transmit the same, certified by its president or vice-president and secretary, to the Executive Committee of Awards. And in case the finding of the committee shall differ from the conclusion of the individual judge making the primary examination, either as to its being worthy of an award or as to the character of the points of excellence or advancement it possesses, it shall be so distinctly stated in the report of said committee.

In every case where the finding of the departmental committee coincides with the conclusion of the individual judge, the said committee shall transmit, with such finding, the report of such individual judge to the Executive Committee on Awards; and in those cases where the finding of the departmental committee does not coincide with the conclusion of the individual judge, then the finding in each such case shall be accompanied by the written report of one of its members who shall have examination of the exhibit, formulating therein in words the specific points of excellence or advancement possessed by such exhibit.

In every case where the finding of the committee is not in accord with the conclusion of the individual judge it shall be within the power of the Executive Committee on Awards, if in its judgment justice demands it, to refer the report back to the committee of that department whence it emanated, with the direction to review and further consider the case and report its finding under such review, without delay, to said Executive Committee on Awards, and such finding shall be conclusive.

The World's Fair Yachts.

The fleet of water craft to navigate the lagoons and basins at the fair is now calling for the labors of 200 or 300 shipwrights. The 50 electric launches for the lagoons are being constructed at Detroit and Racine. The larger boats for the basins and naval exhibits, commodious steam yachts in size, machinery and appointments, occupy the stocks in the shipyard of Charles P. Willard & Co. of Chicago, on the North Branch of the Chicago River. There are 12 of these steam yachts, exactly alike above the water line. Alongside of them are five larger boats, all designed for World's Fair traffic next season. If there is time a half-dozen more will be constructed before the opening of the fair. The later additions will be smaller and have less engine power.

When Mr. Willard secured the concession of running boats on the basins he was confronted with the question of what he was going to do with a dozen boats after the fair was over. At best they would be second hand, and must be disposed of at some price. It could not be hoped that the profits of the World's Fair season, after handing over 25 per cent. of the gross receipts to the Exposition Company, would be large enough to offset a big depreciation.

Acting on this idea, the boats were designed to be large and stanch. The exposition fixed the limit of length at 50 feet, and Mr. Willard took the limit.

Outside of the machinery the dozen boats for the basins and the five larger yachts are now nearly completed. The 17 standing side by side on the stocks make a pretty sight, even on a cold day with the wind and snow blowing through the chinks in the huge shed. On some the permanent cherry and mahogany awning is being fitted. On a pleasant day next April the procession will steam out of the North Branch and down Chicago River to the lake. No finer fleet of steam yachts ever specked Lake Michigan than will be these boats as they hug the shore on their way to Jackson Park.

When the first boat was completed, with the exception of machinery, Mr. Willard made a temporary launch. The boat was towed to a stone derrick by the river side, and exactly 29,500 pounds of stone was lowered into the boat. Just 2 feet of its white side was out of water. Although the displacement had been carefully figured, still there might have been an error, and the shipbuilder was taking no chances. Counting the machinery, fuel and permanent fittings to weigh 5 tons, the boat would have a carrying capacity of 10 tons. This left a wide margin for the local steamboat inspectors, who passed on the plans and fixed the Government limit at 75 passengers.

All 17 boats will have triple expansion engines exactly alike. The cylinders will be 4½, 7 and 12 inches in diameter with 8-inch stroke. The boilers will be the Roberts safety water-tube style, to stand the Government test of 200 pounds pressure to the square inch. Running wide open the machinery will develop 100 horse-power. With the ordinary cut off of steam they will show an economical working force of 83 horse power. This is in excess of the requirements at the fair, as high speed will not count for much in the short runs, but after the fair is over a good 12 mile boat will be much more salable than one of less speed. The machinery alone will cost over $3000 for each boat.

The World's Fair yachts are built with rather bluff, straight bows, and are intended to sit squarely in the water. The boilers and engines are amidships, and are low down in order to lower the center of gravity. A cabin, the roof of which is 3 feet above decks, will cover them. The steering wheel will be in the open space at the bow. Awnings, supported by permanent frames, will extend the entire length. The engines have bronze connecting rods and will be highly ornamented. They will run without noise, and, as the furnaces will use hard coal, the boats will be pleasant for sightseeing. The planking is of oak and white cypress, 1 and 1½ inches thick. The frames are of oak. Brass openings with automatic valves take the place of the usual "scuppers" by which water runs from the deck on a heavy sea.

The five larger steam yachts are trim in model. They are 66 feet keel, 74 feet long over all and 10½ feet wide. They will have a cutter bow, with bowsprit, and two spars, fore and aft. Being extremely sharp, they will have greater speed on the same power than the shorter boats. The boiler and engine will be housed in, but otherwise the decks will be free. Awnings, held by the spars, will be their covering. The rail is handsomely paneled in quarter-sawed oak. These yachts will cost about $7000 apiece. They will be for charter during next summer to private parties who prefer that way of going to Jackson Park.

Already clubs are being formed among residents of the North Side to charter or buy steam yachts for next season. The example of the Buena Park Club in having its own steam yacht has called general attention to the pleasures of yachting on the club plan, and Mr. Willard has prepared for quite a craze in that direction by having speedy and commodious boats which can be chartered by those who do not care to buy. The five will be ready for service at the same time the dozen will sail for the fair grounds.

Following the custom of some steamer lines, the steam yachts will be named after countries the names of which begin and end with "A." The first one, of course, will be the "America."

Time for the Big Building.

There will be many grand objects to gaze upon in the Manufactures Building when the exposition opens, but there is to be one especially which will not fail to attract the attention of all who enter the place. That will be the imposing clock tower which is to stand in the center of the building. It will be 120 feet in hight and 40 feet across at the base. The base will be formed of four round towers rising to a hight of 40 feet. The spaces between the tops of the towers will form archways 30 feet high, which, like the whole structure, will be the same on all four sides. Each tower will be hollow and 10 feet in diameter. One of them will be used as a stairway to the upper part of the main structure and the others will be rented out as concessions.

The archways between the four lower towers will terminate in a groined dome. Over this dome will be the first floor of the clock tower. It will be surrounded by an ornamental balcony, having for its principal ornamentation at intervals the shields of the different States of North America and the coats-of-arms of the South American States. At each corner of the balcony and immediately over the base towers will be domes supported by eight small columns.

The width across the big tower at this point, which might be termed the second story, will be reduced to 24 feet. Within this space will be the resting room for the select few who shall be admitted to this favored spot, for it is believed that if the general public was allowed to enter there would be considerable overcrowding.

Over this room will be another, in which is to be placed the mechanism of the big

clock, whose dials will show forth the time of day at a distance of 70 feet from the floor of the building. There will also be in this room a keyboard, by means of which chimes can be played on nine bells situated high up in the tower.

The fourth story will be the location of the hands of the clock, the dials of which will be 7 feet in diameter. According to the design there is an allowance of 1 foot diameter for the dials for each 10 feet from the ground.

The fifth story will change from the square build of the rest of the tower underneath to a round shape. It will be open and have four double sets of arches. In here will be placed the nine bells. The upper arches will support a dome about 20 feet in diameter, and the whole will be surmounted with a large globe, at a hight of 120 feet, showing the old and new continents in bold relief. The great body of the entire tower will be in white and gold, and all the ornamentation is to be richly gilt.

The base of the structure will be open between the towers, thus allowing free travel to the sightseers. Near the lower part of each tower will be illustrations showing a history of the discovery of America, and the keystone of the arches will be formed of the shields of Ferdinand and Isabella of Spain

The balconies on each of the four sides will be arranged as music stands, from which the various bands will at times be heard.

The clock will be self-winding. In place of having a man go up into the tower every now and then to wind it an electric motor will perform the work automatically. At stated intervals the working of the clock will establish an electric circuit and set the winder in motion.

The clock is loaned without cost by the Self-Winding Clock Company of New York City. The chime of bells is put in by the Clinton H. Meneely Company of Troy, N.Y.

Assignments of Space.

Director-General Davis has submitted to the Executive Committee a report on the amount of space allotted to foreign and domestic exhibitors. Practically all the room in the 13 exhibits buildings has been assigned. Space for the live stock display has not been allotted because it is too early as yet to determine how a proper apportionment should be made.

Out of the 3,642,966 square feet of exhibit space foreign governments have received 1,420,027 feet and domestic exhitors 1,787,263 feet. This is apparently favorable to domestic exhibitors. At the Centennial Exposition there were approximately 24,000 foreign exhibitors and 10,000 domestic ones. According to the allotment made by Colonel Davis, the domestic exhibitors are given the most favorable opportunity practicable for securing space.

While 90 per cent. of the available space has been apportioned, the final notices to exhibitors have not all been sent out.

The following table indicates the total area in square feet in each one of the exhibit buildings and the amount of space assigned in the same to foreign and domestic exhibitors :

Department.	Total area.	Foreign exhibitors.	Domestic exhibitors.
Agriculture	415,348	154,732	251,451
Horticulture	158,593	49,516	69,612
Live stock (no assignments until later).			
Fisheries	80,598	21,875	42,732
Mines and mining	272,615	86,380	142,918
Machinery	455,961	129,982	204,771
Transportation	360,589	166,954	102,934
Manufactures	790,042	428,070	215,927
Electricity	185,100	60,932	137,072
Fine arts	102,436	161,992	30,441
Liberal arts	346,206	119,751	202,420
Ethnology	101,312	43,656	57,656
Forestry	82,566	22,604	29,092
Totals	3,642,966	1,420,027	1,787,263

Out of the entire amount of available space 211,465 square feet has been reserved for concessions. This room will be occupied chiefly by restaurants, booths for the sale of catalogues, mineral waters, guides, &c.

Much disappointment will doubtless be experienced over the space assignment. Many firms who had reason to think that they would secure a fine allotment for the display of their wares will find that they have been omitted altogether. At least 9000 concerns who expected to get into the Manufactures Building have been shut out. This may give rise to the charge of unjust discrimination and partiality, but the exposition officials claim that they found themselves obliged to discriminate and that they have accepted only such exhibits as appear to them to be of the highest character and calculated to reflect credit on an international display.

World's Fair Appropriations.

Appropriations for the fair by foreign governments and the different States of this country are practically closed up and President Harrison will shortly be officially informed by President Palmer's report just how much the United States and all countries are going to do for the big fair. Foreign governments have, all told, set apart approximately $5,843,598.

This amount is distributed among 86 nations, colonies, principalities, &c. Of this number 38 have organized official commissions to conduct their World's Fair business. The remaining number will have exhibits at the fair under less pretentious aspices. There are already in progress of construction 16 foreign government buildings. These pavilions are special in their nature. Countries which will make exhibits in the main buildings have not deemed it necessary to construct special pavilions.

Here is the list of foreign countries which have made appropriations and the amounts of the same:

Argentine	$100,000	Guatemala	$200,000
Austria	102,300	Hawaii	40,000
Belgium	57,000	Honduras	20,000
Bolivia	50,000	Hayti	25,000
Brazil	600,000	India	30,000
British Guiana	25,000	Japan	630,000
British Honduras	7,500	Jamaica	24,333
Barbadoes	5,840	Leeward Islands	6,000
Colombia	100,000	Liberia	7,000
Costa Rica	150,000	Mexico	50,000
Canada	100,000	Morocco	150,000
Cape Colony	50,000	Netherlands	100,000
Ceylon	65,600	Nicaragua	31,000
Cuba	25,000	Norway	56,280
Denmark	67,000	New South Wales	243,325
Danish West Indies	1,200	Orange Free	7,500
Dutch West Indies	5,000	Paraguay	100,000
Ecuador	125,000	Peru	140,000
France	733,400	Russia	46,326
Germany	800,000	Salvador	12,500
Great Britain	291,000	San Domingo	25,000
Greece	60,000	Spain	214,000
		Sweden	108,000
		Trinidad	15,000

Following the recital of what moneys have been appropriated by foreign countries comes a list of the States which have set aside money for the fair. Thirty-one of the States are erecting pavilions. Their appropriations run as follows and aggregate $3,100,045:

Arizona	$30,000	Nebraska	$50,000
California	300,000	New Hampshire	25,000
Colorado	100,000	New Jersey	20,000
Delaware	10,000	New Mexico	25,000
Idaho	20,000	New York	700,000
Illinois	500,000	North Carolina	25,000
Indiana	75,000	North Dakota	25,000
Iowa	125,000	Ohio	100,000
Kentucky	100,000	Pennsylvania	300,000
Maine	40,000	Rhode Island	25,000
Massachusetts	75,000	Vermont	15,000
Michigan	100,000	Washington	100,000
Minnesota	50,000	West Virginia	40,000
Missouri	50 000	Wisconsin	65,000
Montana	50,000	Wyoming	30,000

A number of States expect to secure increased appropriations. New York is asking for $300,000 more from its State Legislature and Governor Flower has recommended it. New Jersey is pleading for $70,000. North Dakota also wants more money.

Miscellaneous.

An interesting feature of the Government exhibit will be a model of the earth, with all the geometrical accuracy that mechanism and art can give to such a difficult representation. It is intended to form a part of the exhibit from the General Land Office of the Interior Department. So far as known it is the largest globe ever constructed. It will surmount a star-shaped edifice, which pedestal will elevate the monster globe 15 feet above the floor, so that it will rise above the surrounding exhibits. The globe will be 63 feet in circumference. A stairway in the pedestal will give access to a gallery at the base of the globe, which will revolve on a horizontal axis.

George Westinghouse, Jr., who has the contract for furnishing the incandescent electric lighting plant for the fair, does not appear to be disturbed by the injunction secured by the Edison Company against his concern. Mr. Westinghouse has just issued a circular announcing that the new stopper incandescent lamps now being manufactured by him will be exclusively used. "At least 92,000 of these lamps," he adds, "will be required by the time the exhibition opens, and it is anticipated that the requirements of exhibitors will increase the number to 130,000 or more."

Germany's list of exhibitors at the exposition numbers 5077 names. In it are represented 230 cities and towns, and of these 40 cities send more than 10 exhibits each. Berlin leads with 283 exhibitors, Munich is next with 187, Leipsic follows with 149, Frankfort is next with 57, Hamburg has 55 and Chemnitz has 41. According to this statement it appears that the cholera-infected city will have a big bundle of goods to display at the fair, but the Director General thinks there will be no danger of infection.

George Chessworth of the London & North-Western Railway of England arrived in Chicago last Wednesday, and called on Chief Willard A. Smith for the purpose of arranging for the installation of the exhibit of that company. The principal feature will be a passenger train headed by a Webb compound locomotive weighing 47 tons, a model ticket office, full-sized models of George Stephenson's "Rocket," Trevithick's locomotive of 1804, and a representation of the L. & N. W. signaling system.

The New York Statue of Liberty, which stands at the entrance of the harbor of the metropolis, is to be shown at the exposition in a model carved out of salt. The exhibit will come from the Salt Union of Cheshire, England. The model will be 12 feet 6 inches high. The ornamental base, which is to be enriched with mouldings, panels and inscriptions, stands upon a sub-base of rough, amber colored rock salt. The statue of the goddess herself will measure 5 feet 6 inches high.

There is some friction between the Dominion and Manitoba governments over the Canadian exhibit at the World's Fair. The Manitoba Government has decided not to exhibit in the Canadian section of the World's Fair, but to have a show of its own outside the fair grounds. This action has aroused the ire of the Dominion Government, as it was understood that Manitoba would take part in the Canadian exhibits and give $2000 toward the erection of a Canadian pavilion.

Electric belt and other appliances of a like character will be given no space in the electricity department of the World's Fair. Chief Barrett and his assistant, Chief Hornsby, have decided to exclude this class of exhibits, as they do not consider these devices as being strictly electrical in their character.

The brick and tile manufacturers of the country and the manufacturers of fire extinguishing machinery have decided practically to put up special buildings adjacent to Machinery Hall for exhibits of these industries.

Steam and Hot-Water Circulation

The Blower System of Heating and Ventilation.

By Walter B. Snow.

(*Concluded.*)

REGULATION OF AIR SUPPLY.

By a proper arrangement of supplementary heaters or by a double system of hot and cold-air ducts, the temperature of the air admitted to any room may be varied at will without changing its volume. The vent registers should usually be so proportioned as to cause a slight pressure to be maintained within the room—causing all leakage to be outward, and avoiding that most prominent objection to the vacuum system—viz., the tendency to draw air into the room from all sources, good or bad.

As almost universally arranged, the entire steam hot blast apparatus is placed in the basement (or first floor when no basement exists), together with all distributing mains. Air is supplied to the rooms above through vertical risers, either of brick or metal, the air being discharged therefrom through outlets 8 or 10 feet above the floor. There is thus avoided all danger from the leakage and freezing of coils incident to any direct system, for in the blower system the entire heating surface is massed in a single heater in connection with the fan, and there are no isolated coils or extended lines of steam supply and return pipes.

The compactness of this heater and its reduced size, as compared with the heating surface required to produce the same results when applied as direct radiation, form marked features of this system.

The condensation of steam in a given heater is dependent upon the temperature of the air, the pressure of steam and the amount of air coming in contact with the heater pipes in a given time With natural circulation, the amount of air passing through the heater is comparatively small and the condensation correspondingly light.

CAPACITY OF HEATERS.

With a forced circulation of air, however, the volume of air may be varied at will. In ordinary practice with the blower system in mill and factory heating from 25 to 35 cubic feet of air pass through the heater per minute per square foot of pipe in the heater. What enormous condensation results may be realized when we see that through a heater of 1000 square feet there may every minute be caused to pass a volume of 25,000 to 30,000 cubic feet of air at an entering temperature of zero degrees in a single row of 1-inch pipe placed crosswise of the air current under high pressure steam (80 pounds or thereabouts) with air entering at zero, in the above cited propositions the condensation may mount up to 5 or 6 pounds per square foot per hour. The ordinary rough boiler rating is 15 square feet of heating surface per horse-power, which at 30 pounds of steam per hour per horse-power indicates an evaporation of 2 pounds per square foot per hour in the boiler, which is only one-third to two-fifths of the condensation per square foot per hour in the heater. There would thus be required 166 to 200 horse-power of boiler to supply steam to the single row 1000 foot heater.

Although a single row heater is not practical, nevertheless these figures illustrate most vividly the difference in conditions between natural and forced circulation heaters. The ordinary mill heater for the blower system is 16 to 18 rows deep of 1-inch pipe, and the condensation therein under above conditions will run from 1½ to 3 pounds per hour per square foot, according to conditions.

Under similar circumstances 1 foot of pipe in a heater in connection with a fan is as efficient as 3 to 5 feet in the ordinary direct radiator.

UTILIZING EXHAUST STEAM.

To a very large extent in the heating of manufacturing establishments exhaust steam is used in the heater during the day—the condensation being much less than with live steam—which is used at night if the apparatus is in operation.

In hot blast heating apparatus driven by direct connected engines the engine exhaust is always utilized in the heater, and in mild weather often suffices for the heating. This utilization of the exhaust reduces to almost nothing the cost of driving the fan, for the exhaust from the fan engine is practically as efficient for heating as the live steam when it first entered the cylinder. In numerous cases the fan is provided with tight and loose pulleys, being driven during the day by a belt from line shaft and by night by a special independent engine.

The blower system is thus seen to be positive in action, capable of adjustment to any degree of ventilation and always under immediate control. As compared with direct radiation, far less heating surface is required, danger of leakage and freezing is avoided and all the steam and drip valves are upon the apparatus itself rather than at distant points. Purity of air, equality of temperature and a resulting improvement in the health of the occupants mark the advent of the blower system in any building.

The American Boiler Company.

The American Boiler Company were organized in Chicago on Monday last, with a capital of $1,500,000, and have purchased the steam and hot-water boiler business of the Pierce, Butler & Pierce Mfg. Company of Syracuse, N. Y.; the Richardson & Boynton Company of New York City and Chicago, and the National Hot Water Heater Company of Chicago. The directors of the company are: W. K. Pierce and Clarence V. Kellogg of Syracuse, N. Y.; H. T. Richardson of New York City and A. P. Richardson, George E. Downe and Henry S. Downe of Chicago. The headquarters of the company will be located in Chicago, probably at 34, 36 and 38 Dearborn street, and they have already secured locations for branches in Boston, New York, Philadelphia, Chicago, St. Louis, Denver, San Francisco and Portland, Ore.

By this movement they secure the control of the manufacture and sale of the Florida hot-water and steam boilers, the Perfect hot-water and steam boilers, also the Spence hot-water heater and the Soleil safety steam boiler, with plants at Syracuse, N. Y., Brooklyn, N. Y., and Canton, Ohio.

The management state further that it is their purpose to handle a full line of wrought iron and steel tubular boilers for power and heating purposes and a full line of steam-fitters' specialties. Competition in this line of goods has been in the past exceedingly sharp and expensive, as all of the companies above referred to have maintained branch houses in the principal cities of the country, and at the same time a large and expensive corps of traveling men. Practically all of the managers, together with the best salesmen of the respective concerns, will be retained in the organization of the new company and for the most part covering their old territories, and it will be the policy of the new company to follow those methods which have been followed by these companies so successfully.

The American Boiler Company will make one radically new departure, the numerous criticisms of the various patented hot-air and hot-closet systems of heating and ventilating schoolhouses having prompted them to organize an entirely separate department in their business, which will be devoted exclusively to the matter of heating and ventilating schoolhouses and public buildings. W. M. Mackay, formerly manager of the boiler department of the Richardson & Boynton Company of New York, has been placed at the head of this department. The local steam fitter is in a position to execute all contracts for schoolhouse heating far more economically and far more satisfactorily than can any foreign company, and believing that the local fitter in such cases should have the preference, plans and specifications will be furnished by the company, if desired, so that any member of the trade can execute such contracts with absolute confidence in his success.

Most of the men who are well known to the members of the trade have already associated themselves with the new organization. Thomas E. Crone, formerly manager of the Florida Heater Department, will be manager of the New York branch, with headquarters at 94 Centre street, and W. H. Oakes, formerly secretary of the National Hot Water Heater Company, will be in charge of the New England branch, with headquarters at 195–197 Fort Hill Square, Boston. It is rumored that it is not at all improbable that the company will acquire by purchase control of some other of the well-known boilers in the market, and with their complete organization they cannot help but be a most important factor as regards the trade in house heating boilers.

One of the aims of the new company will, we understand, be to attempt by equalizing prices to so harmonize the interests of the trade that better prices may be secured to the steam fitter for house-heating contracts.

The officers of the company are: William K. Pierce, president; George E. Downe, vice-president; Clarence V. Kellogg, treasurer; A. P. Richardson, secretary; Henry S. Downe, assistant secretary; and the management of the new company is in the hands of those who have practically had the management of the three companies above referred to.

HEATING NOTES.

With the consolidation of the Florida, Perfect and Spence boilers into the American Boiler Company it was feared by some that the recently organized United States Steam and Hot-Water Heater Manufacturers' Association might fall through. On account of this important business change a special meeting of this association was begun at Buffalo, N. Y., on Thursday of this week to decide upon the future of the organization.

The Toronto Radiator Mfg. Company, Limited, Toronto, Canada, favor us with a calendar for the current year. It is plain but neat in design and the large, well-printed calendar sheets will be appreciated by those who wish a calendar to tell the days of the month rather than for a wall decoration. The upper part of the sheet carries the announcement of the company with a glorified form of Industry resting on a Safford radiator, which in turn is supported on a base made up of many business virtues. The background is a part perspective view of the company's foundry, with all of Canada and two oceans seen in the distance.

H. H. Burns, 113 State street, Boston, Mass., is the sole agent for Maine, New Hampshire, Massachusetts and Rhode Island for the Ardent portable steam heater for gas or oil. The heater consists of a radiator with a burner below, so that steam is formed from the water and the heat is given off from the radiator surface. The heaters are furnished in various sizes from four to ten sections.

We are under obligations to the Nason Mfg. Company, 71 Beekman street, New York, for an exceedingly useful and pretty little envelope opener and paper cutter. It is in the shape of a 5-inch scale, rounded at one end and beveled toward the other with a thin edge. At the butt of the paper cutter is the modest announcement of the Nason Mfg. Company and of their Equator heater. The chief charm about this souvenir is its material, being made of aluminum, and it is in consequence light, bright, and serviceable.

Ernest W. Mehrino has been appointed manager of the Minneapolis and St. Paul branches of the American Radiator Company, 111-113 Lake street, Chicago.

The newly organized American Boiler Company are about to distribute to the trade a handsome calendar for the current year. It will be issued on February 1, and will, without doubt, be much appreciated by those who receive it. The card is of oblong shape, decorated in colors by an arch with the signs of the zodiac. Some cheerful verses occupy part of the space, and the plain announcement of the American Boiler Company is conspicuously printed in the center. Reference is made to the branch offices in Boston, New York Chicago, Denver, San Francisco and Portland. At each side of the calendar proper are lists of the Steam and Hot-water Boilers, the factories of the American Boiler Company and the names of the directors.

A. A. Spear, 88 Lake street, manager of the Chicago branch of the Magee Furnace Company, Boston, Mass., reports a favorable trade in the Boston combination heaters for warm air and hot water. Among the residences in Chicago and vicinity in which the Magee system of warm air and hot-air heating has been placed can be mentioned those of A. N. Merriman, 143 Hoyne avenue, two heaters; S. L. Williams, 306 Ontario street; Geo. A. Tripp, Greenwood avenue; F. M. Baxter, 3029 Grand Boulevard; Mrs. Max Hjortsberg, 387 La Salle avenue, and E. A. Driver, Riverside, Ill.

Combination of Emery Wheel Manufacturers.

The Columbian Emery Wheel Company, with $600,000 capital, were organized under the laws of the State of New Jersey, at Trenton, January 12, 1893, and officers were elected as follows:

Frederick S. Dickson, president.
F. H. Pietsch, vice-president.
L. Pest, secretary.
F. R. Preston, treasurer.

The following have been chosen directors of the company:

Frederick S. Dickson, Philadelphia, Pa.
F. H. Pietsch, Chicago, Ill.
L. Best, New York, N. Y.
C. Ross Grubb, Camden, N. J.
Clarence Tebbets, Waltham, Mass.
F. R. Preston, Detroit, Mich.
Harlan Page, Philadelphia, Pa.
Geo. Maitland, Detroit, Mich.
Geo. W. Jackman, Bridgeport, Conn.

The company will endeavor to obtain control of the principal emery mines of this country, and it is expected, as the above list indicates, that all of the most prominent manufacturers of wheels will enter the combination. We are informed that one of the main points aimed at is to reduce the cost of marketing the product by properly apportioning the territory and by systematizing the selling. No attempt will be made to raise prices, but an effort will be made to have something like a standard price. It is expected that the company will begin business in a few weeks with the following firms as members: Northampton Emery Wheel Company, Leeds, Mass.; Chicago Emery Wheel Company, Chicago; Sterling Emery Wheel Company, New York; Morton Emery Wheel Company, Worcester, Mass.; Grant Corundum Wheel Company, Chester, Mass.; the Abrasive Wheel Company, Philadelphia; Michigan Emery Wheel Company, Detroit; Vitrified Emery Wheel Company, Westfield, Mass.; Springfield Emery Wheel Company, Bridgeport, Conn.; Celluloid Emery Wheel Company Newark, N. J.; Waltham Emery Wheel Company, Waltham, Mass.

BUSINESS ITEMS.

James Shaw of Marlborough, N. Y., is building a two story establishment and, when completed, will do a general stove, tin and hardware business with W. H. Newman of the same place.

Morris Warner & D. Milroy will open a hardware store at Mayfield, N. Y., February 1.

We are indebted to Frank J. Ross, Tell City, Ind., for a neat little business souvenir that he is distributing to his friends in the trade. The device is a self-feeding match box built of cardboard and covered with glazed colored paper. The reservoir, or match chute, at the top carries an announcement concerning Frank J. Ross and his business in stoves and kitchenware. The announcement is arranged as an acrostic with the proper name in capital initial letters.

We have received, with the compliments of G. W. Reeder of Newville, Pa., a very neat calendar for the new year. It measures 4½ x 7 inches, and is embellished with a colored panel picture, which occupies the upper portion. The name and address of Mr. Reeder occupy the central portion of the card, while beneath are the leaves forming the calendar proper.

We have received an invitation to be present at the wedding of Walter E. Leidy and Alma B. Richards at the Third Christian Church, Richmond, Va., Wednesday evening, February 8. Mr. Leidy has our most cordial congratulations for the coming event, and we are sure that all his friends in the trade will join us in wishing him prosperity and happiness. We understand that the firm of M. S. Leidy will, after June, be known under the name of M. S. Leidy & Son.

The Nova Scotia Coal Fields.

A grand consolidation of the bituminous coal interests of Nova Scotia is on the eve of being consummated through the joint efforts of American and Canadian capitalists, and a similar movement for the control of the mines in New Brunswick is reported. The Nova Scotia Legislature regards the matter of so much importance that a special session has just been called to legalize the transaction, which step may be explained by the financial necessities of the province, as it appears that the coal managers have promised to pay the Government 12½ cents royalty. It has been assumed by writers on the subject that the United States citizens concerned are calculating with confidence that Congress will soon put coal on the free list, thus opening the way for remunerative speculation. Canadians generally, especially in the larger cities, are taking a deep interest in the subject, as they obtain the bulk of their coal supplies from Nova Scotia and are apprehensive of a "corner" prejudicial to their interests. The proposed combination, it is said, will be in a position to compel any independent company not included in the arrangement to co-operate in its policy. There has been a large development of the coal trade of Nova Scotia during the last 14 years. The sales in 1878 were 888,000 tons; last year they were 1,761,000 tons. Between one-third and one-half of this finds its way to Quebec and Montreal. The New Brunswick Company claim to have located two seams, one of 6 feet and the other of 10 feet, of pure anthracite coal. Attempts to work this coal field have been made off and on for many years, but, owing to the want of capital, with little success. Of course Boston and the Eastern States watch events now transpiring with interest, as manufacturers in that region naturally entertain the hope of a trade with Nova Scotia that may prove highly advantageous, not only with reference to imports, but as opening a profitable market. For example, the Dominion might find it difficult to compete in supplying the Bluenoses with flour, and a more liberal interchange of products would be likely in course of time to bring all the maritime provinces into closer commercial connection.

In reference to railroad pooling, which railroad managers earnestly desire to sanction, when an amendment of the Interstate Commerce law to this effect was proposed in Congress last week, a negative was encountered in the House.

Eiffel's plan for a great bridge across the River Neva at St. Petersburg has just been accepted, and the St. Petersburg municipality has voted the 26,000,000 rubles required to build it.

American travelers returning from Honduras report that a large number of Americans are in that Republic and that the capital is almost an American city.

TIN PLATES.

American Tin-Plate Brands.

The recognized position which American tin and terne plates have now attained in the home market, and the fact that native material is winning its way into general use, make it desirable that some definite knowledge of the various new tin-plate brands that are to day being placed on the market by American manufacturers should be possessed by our readers. It is unlikely that the average consumer has, as yet, much notion of the number of fresh brands and trade-marks on plates and boxes, which have cropped up so luxuriantly of late in connection with our domestic tin-plate manufacture, and we fancy buyers must occasionally feel themselves somewhat at sea among the new names put before them in the market. Some of the brands adopted by the pioneers in the tin-plate industry and the more prominent makers are doubtless more or less familiar in the trade, but a large number of them must be still new and strange. The past 12 months have seen a number of new tin-plate brands come into existence, and every month brings additions to the list. It appears to us, therefore, that the time has arrived when it will be well to promulgate all the information it has been found possible to obtain on this subject, which, we believe, will be of much interest and utility to those who use this newest domestic product. With this end in view we print below under the headings of different concerns now making tin and terne plates in the United States the names and grades of their products, together with such information in regard to sizes, weights, qualities, &c., as they have afforded us. In addition, we have, whenever practicable, reproduced in *fac-simile* the brands and trade marks stamped on plates or boxes by the various makers. The plates mentioned below are only such as are being actually produced and placed on the market to-day from American tin plate works. A glance at the list will show that several grades and varieties of both bright and roofing tin are represented among the manufactures.

Besides the firms whose names appear below, there are others who make tin plates solely for their own consumption. We regret that from a few makers the necessary information has not reached us in time for incorporation in the present list. These brands we expect to give in a supplementary notice.

American Tin & Terne Plate Company,

Philadelphia, are making two brands of terne plates, stamped, respectively, "KEYSTONE" and "PURITAN."

American Tin Plate Company,

Elwood, Ind., are producing an extensive line of both tin and terne plates. They do not stamp any of their plates, nor have they yet adopted any trade mark. The marks on their boxes are stenciled lettering for "coke," "charcoal" and "terne" plates respectively. The company will probably adopt distinctive names for their various brands before long.

American Tin Plate Machine & Mfg. Company,

Philadelphia, make a specialty of continuous sheets of roofing terne, soldered together and tinned, in one operation, by their special automatic machine. The material can be made and supplied in rolls up to 80 feet in length.

Baltimore Steel, Iron & Tin-Plate Company,

Baltimore, Md., commenced operations with the opening of the present year. Their present productions consist of one brand of bright tin plates, named "ARTO," and so stamped on boxes. The sheets are made of Siemens steel. Also, one brand of terne plates, stamped on boxes "LILY."

Cleveland Tin Plate Company,

Cleveland, Ohio, have been in operation for about a year and are putting on the market both bright and roofing plates of the following gauges and qualities: IC, IX and IXX in 10 x 14, 14 x 20 and 20 x 28 sizes. The company's registered trade-mark, as shown in Fig. 1, is "Buckeye," by which name their various productions are known.

Fig. 1.—Trade-Mark. Cleveland Tin Plate Company.

Each box of plates is marked on the cover with the stenciled brand shown

Fig. 2.—Stenciled Marking. Cleveland Tin Plate Company.

herewith, Fig. 2, in addition to the gauge and quality mark on the side.

McKinley Tin Plate Company,

Wilkinsburg, Pa., have hitherto confined their efforts to the production of

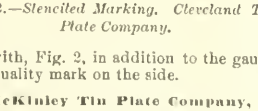


Fig. 3.—"McKinley" Stamp. McKinley Tin Plate Company.

terne, and will not make bright tin so long as the demand for roofing plates continues as pressing as is now the case. Their output includes three brands of terne, IC and IX, 14 x 20 and 20 x 28 viz.:

1. "*McKinley Roofing.*"—A heavy rolled plate, coated by the palm oil process. Boxes are marked on one side "M'KINLEY ROOFING," with gauge and quality; on the other side, "M'KINLEY TIN PLATE CO., PITTSBURGH, PA.," and each plate is stamped with the brand "McKinley." (See Fig. 3).

2. "*Fort Pitt.*"—A light weight rolled plate, coated by palm oil process. Black sheets weigh 180 to 190 pounds. Boxes are stenciled similarly to "McKinley Roofing," except that the name "FORT PITT" is substituted for that brand. The plates are each stamped with the name "Fort Pitt," as in Fig. 4.

Fig. 4.—"Fort Pitt" Stamp. McKinley Tin Plate Company.

3. "*Wilkinsburg Re-Dipped.*"—An old style hand-dipped plate. The box marks are similar to both the above, except that the name "WILKINSBURG RE-DIPPED" takes the place of the other brand names. (See Fig. 5.)

Fig. 5.—"Wilkinsburg Redipped" Stamp. McKinley Tin Plate Company.

Weight guarantee is given to the purchasers of all these plates.

Morewood Tin Plate Mfg. Co.,

Elizabethport, N. J., have only one brand at present in use for their plates, viz., "P.T.L." Several grades of both bright and roofing tin, bearing similar brands to the corresponding plates made by this firm in Wales, are shortly to be put out.

Norristown Tin Plate Works,

Norristown, Pa.: The output of this concern consists of two brands of Terne plates.

1. *Norristown, Pa.*—A dull terne. Made in sizes—20 x 28 and 14 x 20. The boxes

are branded on the side with the name, as above, as well as IC or IX, according to gauge. Each plate is stamped with the name, traversed by arrow, as in Fig. 6.

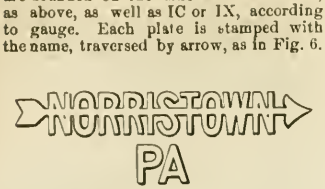

Fig. 6.—"Norristown, Pa.," Stamp. Norristown Tin Plate Company.

2. "*Earnest*," are bright ternes, of standard sizes. Boxes branded on the side with brand name and gauge. The plates are not stamped.

Both grades run in weight as follows:
IC, 14 x 20, 108 pounds per box.
IC, 20 x 28, 216 pounds per box.
IX, 14 x 20, 136 pounds per box.
IX, 20 x 28, 272 pounds per box.

Locust Point Iron & Steel Works Company,

Baltimore, Md., Messrs. Coates & Co., are producing bright tin plates of standard sizes. No brand has yet been adopted, but

Fig. 7.—Trade-Mark and Box Stencil. Coates & Co.

each box lid is stenciled with the company's name and trade-mark, an eagle and goat, as shown in Fig. 7.

Phillips Tin Plate Company,

Philadelphia: The present output of this concern consists of three grades of American bright tin plate and two grades of roofing terne.

The bright tin plates are marked on boxes as follows:

1. "*Vernon*" branded on front, with size of plate; "BEST CHARCOAL" on one side, and "BRIGHT TIN" on the other side.

2. "*Rees No. 1*," so branded on front of box. Side marks are similar to the above.

3. "*Hengoed*" branded on front. On one side, "BEST COKE;" on third side, "BRIGHT TIN."

Terne-plate boxes bear the following marks:

1. "*Phillips' Best*," so branded on front of box. One side bears the words "HEAVILY COATED." The opposite side is marked with size, &c.: "20 X 28, IC," or "IX," "AMERICAN ROOFING."

2. "*Phillips' O. K.*" Name branded on front; "MEDIUM COATING" on the one side, and size, &c., on the opposite side.

Pittsburgh Tin Plate Works,

New Kensington, Pa., are turning out two brands of roofing plates, IC and IX., in sizes 14 x 20 and 20 x 28, viz.:

1. "*Westmoreland*," so marked in plain 1-inch letters at the end of the box, together with the letters IC or IX, and size marks. On the sides of the box are stamped the words "AMERICAN ROOFING PLATES." Each plate is stamped with the brand name, as in Fig. 8.

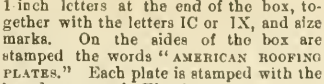

Fig. 8.—"Westmoreland" Stamp. Pittsburgh Tin Plate Works.

2. "*Kensington*," so marked on the end of the box. All other box marks are similar to those detailed for "Westmoreland." Plates are stamped with name as shown in Fig. 9.

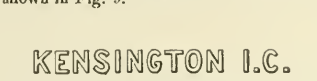

Fig. 9.—"Kensington" Stamp. Pittsburgh Tin Plate Works.

In bright tin the company produce a best charcoal plate, "KENSINGTON," so stamped on one end of the box; the other end is marked with the size and thickness, and the word "CHARCOAL" is displayed on the side.

The lids of all the company's boxes are stenciled

"FROM
PITTSBURGH TIN
PLATE WORKS,
NEW KENSINGTON, PA."

Record Mfg. Company,

Conneaut, Ashtabula County, Ohio, produce only bright charcoal and coke tin, in five grades, for stamping and manufacturing purposes. Each box is marked on the side with brand and quality, as follows:

1. "*IC*" (or "*IX*") "*Record Charcoal. A.1.*" This is a bright charcoal plate corresponding to "Melyn."

2. "*IC*" (or "*IX*") "*Record Charcoal. A.*" A bright plate representing "Grange."

3. "*IC*" (or "*IX*") "*Record Charcoal. B.*" This quality is composed of charcoal "Wasters."

4 "*IC Record Coke*," and

5. "*IC Record Coke. W.*," containing coke "Wasters."

James B. Scott & Co.

Pittsburgh, Pa., are now placing upon the market two qualities of terne plates.

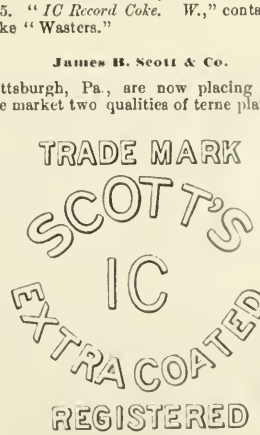

Fig. 10.—Jas. B. Scott & Co. Trade-Mark.

1. "*Scott's Extra Coated*" IC and IX, 14 x 20 and 20 x 28. A guaranteed plate, with, it is claimed, the heaviest possible coating, containing a large proportion of pure block tin. Average weight exceeds 240 pounds per box IC 20 x 28, and 290 pounds for IX 20 x 28. 14 x 20 size one-half of above. Each plate stamped with registered trade-mark, illustrated in Fig. 10.

Boxes stenciled with name of plate, gauge and "JAMES B. SCOTT & CO., PITTSBURGH, PA." "AMERICAN MADE."

"Scott's Extra Coated" plates are hand made in open pots by pure palm oil process; the sheets being best quality soft steel. Each box contains an assorter's card, with registered trade-mark, and a guarantee. The card bears the initials of the assorter, and is requested to be returned should any sheet not be found up to standard.

No imperfect or "Waster" sheets are stamped.

2. "*Neville*," a bright terne plate, made of best quality steel by the roller process, and carrying a fairly heavy coating, with large proportion of block tin. Each box

Fig. 11.—"Neville" Brand. Jas. B. Scott & Co.

is marked with name of brand as above, gauge and name of maker, &c., similar to that noted for "Scott's Extra Coated." Each sheet is stamped as in Fig. 11.

Somers Bros.,

Brooklyn, N. Y., are turning out several qualities of bright coke and charcoal plates for stamping purposes in uniform size 14 x 20, gauges IC, IX and IXX. All boxes are branded on the side "SOMERTON."

THE PHILLIPS TIN PLATE COMPANY, Philadelphia, who have recently started into operation in the manufacture of American tin and terne plates, inform us that the demand for their material has been very satisfactory. They have been obliged to work overtime to keep up with orders received; and are already contemplating increasing the capacity of their works.

An electrically heated soldering tool has been patented by Charles L. Coffin, Detroit, Mich. The head of the tool is filled with melted solder, which is retained by a screw plug arranged to close an orifice. The electrical current heats the head until the solder is melted, and by regulating the screw mentioned the solder can be laid upon the joint as desired.

Manning, Bowman & Co., Meriden, Conn., are the assignees of a patent recently issued to Edward B. Manning of that place for a handle for culinary vessels. The construction of the handle is such that it may be readily applied to or detached from the article as occasion may require.

The first of a series of semi-monthly social gatherings given by the Auchmuty Musical Society to the members of the day classes of the New York Trade School was held Thursday night in the main lecture room of the school, Sixty-seventh street and First avenue. At ten o'clock a supper was served, and afterward the young men met their different instructors for an hour's informal talk regarding their work and progress.

Borough Road Polytechnic Institute of London, England.

Through the courtesy of C. T. Millis, principal of the Educational Department of the new Borough Road Polytechnic Institute of London, we have been favored with a prospectus of that institution which is of great interest. The pamphlet contains, among other matter, an outline of the course of instruction given in the evening educational classes of the institute during the present term—viz., from October 1, 1892, to May 31, 1893 This document provides some interesting information in regard to the technical and trade subjects taught in the classes, which we believe will be of use to our readers. We therefore propose to give some account of the institute and its methods as they bear upon the manual and theoretical instruction provided for such trades as come more particularly within the scope of this paper.

INAUGURATION OF THE INSTITUTE.

The Borough Road Polytechnic Institute, which is, we believe, the first one opened under the act of Parliament recently passed to encourage such establishments, has been planted down among the homes and haunts of the London workingman. It is situated in the southeastern part of the city, on one of the main arteries of the great London street system—the Borough Road—a quarter settled by a class of artisans and tradesmen who would be most likely to profit by such an institution. The institute building is a handsome structure of ample proportions, containing a large number of well-equipped class and lecture rooms, workshops, laboratories and all the necessary paraphernalia for a thorough instruction in the comprehensive fields of practical and theoretical study which the institute aims to cover. The instruction is offered at an almost nominal cost to all who wish to avail themselves of it. The building was opened for use on the first of last October. Consequently the present is the initial season of its operations, for which reason no reports of results can yet be given. The enterprise can, however, hardly be considered as a new venture. The members of its staff have all been previously connected with similar work in the large Technical College at Finsbury, London, or other kindred institutions. They, therefore, bring such a wide practical experience in the various methods of technical education to the new field that the success of the institute should be fairly assured.

GENERAL AIMS OF THE INSTITUTE.

Mr. Millis, the principal of the Educational Department, himself long connected with the Finsbury College, writes to us as follows in regard to the aims of the promoters of this establishment: "Let me call your attention to the fact that as far as possible both theory and practice are taught in every technical and trade class. I am also endeavoring to make our science and art classes especially useful to those engaged in the various trades or industries for which we have classes. For this reason the governors of the institute permit any of our students attending, say, the plumbing, carpentry, pattern cutting, bricklaying or other class to join any science and art class at half fees. And apprentices in any trade are admitted to the class for their special trade at half fees. Our workshops are fitted up with the same style of tools and appliances as those used in factories and workshops outside. But we do not attempt to teach trades. We only supplement the training of the workshop and teach the higher branches of the trade." And herein lies the principle of the whole institution, which is not to give a thorough education, commencing from the groundwork—as is the case with the majority of the trades schools in this country—but the Borough Road Institute aims at helping the youth or man who is already working at a trade to improve himself and more quickly to render himself efficient in his occupation. At the same time it holds out to him inducements to study in other fields more or less connected with his own business and to improve his mind by joining some of the science or art classes, the cost of such instruction being reduced to a minimum. The science classes treat of such subjects as elementary mathematics, geometrical drawing, applied mechanics, machine and building construction and drawing, chemistry, &c. The art classes embrace freehand, model and perspective drawing, with lectures on design. That these opportunities will be appreciated and made use of by many trade students we do not doubt, for many of the subjects bear directly upon the theoretical part of their own business—a knowledge of geometrical drawing, applied mechanics, and even chemistry, would not come amiss to a plumber or sheet-metal worker; but would certainly tend to make him a more thoroughly efficient workman.

PLUMBING CLASS.

The technical and trade classes cover a wide field of industry and embrace such varied occupations as brick work and masonry, carpentry and joinery, plumbers' work, builders' quantities, sheet-metal work, photography, tailoring, wood carving, hat manufacture, paints and oils, typography, tanning, boot and shoe manufacture, &c. Of these we may make special mention of such trades as appeal more directly to the interests of the readers of *The Metal Worker*, viz.: Plumbing and sheet-metal work. Of the former we regret having no detailed information as to the course of instruction pursued. The classes for this trade are, however, held on two evenings of each week, from 8 to 10 o'clock, one evening being devoted to theoretical and the other to practical instruction, both of which, we are informed, are very thoroughly taught. It is stated that it is the intention of the governing body of the institute to open special classes for adult plumbers before long. Such classes have been tried and successfully carried on at Westminster, London, for some time.

SHEET-METAL WORK.

This branch of trade is taught on one evening of the week, from 7 30 to 10 o'clock, and special lectures on subjects connected with metals, sheet-metal pattern cutting and other topics of similar interest are delivered for the benefit of the students on other evenings, admission being free. The course of lessons as outlined in the prospectus for sheet-metal workers, including tin, iron and zinc workers, boiler makers and coppersmiths, &c., is very wide reaching. The subjects taught include the following: Problems in plain geometry useful to metal plate workers, introduction to solid geometry and its application to pattern cutting, sections, elbows, T elbows, construction of patterns for round, oval, oblong and other tapering articles of equal and unequal slant; oval canister tops, tea bottle tops, &c.; bath patterns; cones, their development and application to various patterns as cowls; soldered, grooved and riveted joints; the manufacture and properties of iron, galvanized iron, tin, lead, zinc, copper, &c.; solders and soldering composition, preparation and uses of various solders, action of acids, behavior of metals when hollowed, raised and planished; tinning processes, &c. The laboratory and workshops for metal workers at the institute have, we are told, been fitted up with blowpipes and the necessary appliances to enable students to test the physical properties of the various metals, to prepare alloys as solders, &c.; and also to construct models from their drawings.

TUITION FEES.

The fees for the course of instruction in each class are, as we have intimated, almost nominal, and place them within the reach of all. For those classes which are held on but one evening of the week the fee is 4 shillings ($1) for members of the institute (who become so on payment of a small annual subscription), while non-members pay 5 shillings. In the plumbing classes, however, and all those which are held twice a week, these amounts are doubled. While to apprentices under 19 years of age, who can produce certificates from their employers that they are actually working at a trade, even these small fees are reduced by half. In addition to this the science and art classes are open to trade students at half the above rates. These advantages could only be offered by an institution having some solid financial backing; and in this case such is afforded by Government grants, under a special act recently passed by the British Parliament, for the purpose of encouraging the establishment of such educational institutions throughout the British Islands. The connection of the Borough Road Institute with the wealthy "City and Guilds of London Institute" no doubt also strengthens its financial position. But however that may be, we feel assured that the Borough Road Polytechnic Institute is doing and will do a good work, for which it appears peculiarly well equipped.

OBITUARY.

VICTOR COLLIAU.

Victor Colliau, the well-known inventor, mechanical engineer and artist, died 17th inst., in Detroit. He was born in Paris, France, in 1828. He belonged to a family of ironmasters who for three generations had conducted extensive works at a small town 30 miles from the French capital. Young Colliau was given an excellent education in chemistry and engineering, and had as tutors some of the best instructors of the times. An inventive strain ran through the Colliau family for years before the subject of this sketch was born. The first wire nails ever made by machinery were the result of the genius of his grandfather, and the first machine-made wire rope was the invention of Colliau's father. Having completed his education, he was placed in charge of his father's establishment, a position he held until the business went under in the stagnation which followed the coup d'etat in the '50s. In 1857 some French adventurers formed a bogus stock company for the purpose of working large tracts of mineral lands in West Virginia, and Victor Colliau, at that time a rising young engineer, was employed to superintend the mines Later Mr. Colliau went back to France, where he saw a device for the saving of fuel in iron melting. He returned to this country and patented an improvement on the French idea. In 1884 he invented the present Colliau cupola.

An entry was made in the United States Circuit Court at Cleveland on the 11th in the action of the Pittsburgh Reduction Company of Pittsburgh against the Cowles Electric Smelting & Aluminum Company. The decree was for the complainant, the Pittsburgh Reduction Company, declaring the validity of the Hall patent and that the Cowles Company had been infringing that patent.

STOVE TRADE NOTES.

Changed Conditions in the Stove Trade.—IV.

By Stovemaker.

The demoralization in the stove business resulting from the entrance of furniture dealers in the retail field, which was enlarged upon at an earlier stage of this article, was not limited to its effect upon the welfare of the stove departments, but was responsible to some extent for the losses in the repair department as well. As previously remarked, the furniture dealers added stoves and all stove fittings to their business except repairs, and those they would not bother with. Those who did try them found that their customers expected a new grate free in consideration of a large bill they had bought, and the dealers found it paid them better not to keep repairs at all. This cut off the opportunity of the salesmen to sell repairs when taking the stove order, as they had always done with the stove dealers, and as, in fact, they had been specially ordered to do when the repair men began to grow in numbers and make themselves felt, but the position of furniture men with regard to repairs blocked the effort to a certain extent.

That being the case, it might be asked why the stove salesman did not canvass specially for repair orders among the stove dealers whose stove business had declined, but whose repair business for a while had increased? The answer is that many of the stove dealers could not be convinced but that the manufacturers were largely responsible for the growth of the furniture store trade in stoves, and they would have bought of the pirates even at a higher price rather than patronize the manufacturers for anything they could buy elsewhere; and again the desire to capture furniture men as stove customers, and the time and effort required to do it forced the repair issue to one side.

Hence the repair men flourished and branched out. Small brick works and foundries have been established hereabouts, supply concerns have sprung up in all the cities and the repair business has gone almost wholly into their hands. What is sold by the manufacturers to repair their own stoves is but a shadow of the demand constantly being satisfied by repair men with castings that never saw the inside of the stove man's foundry, and along with it has gone the trade for a whole lot of things, of which a good many were always sold by stove manufacturers, such as pokers, lifters, dampers, pipe, elbows, stove boards, mica, hollow ware, &c.

With the spirit of accommodation for which these men have always been noted, they established wagon deliveries to supply their customers more promptly and to secure all the trade they could. They likewise canvassed among the real estate agents and janitors of flats when the modern apartment houses had grown to be so numerous in this city, and of which so many thousands were erected in this same period of change in the stove trade between 1882 and 1892. The thousands of ranges used in these flats, the repair of which is often under the control of either the janitor or agent, furnished a lucrative business for the repair men, and they were not slow at seeing their advantage.

They soon learned with what particular make of range certain blocks of houses or localities were furnished, and supplied their wagons with the requisite repairs for them.

EFFORTS TO CHECK FURTHER INROADS.

Some effort has recently been put forth to check further inroads into the repair business by the formation among manufacturers of associations, of which the one in this city is a specimen, for the sale of all repairs in competition with the repair men. A pool is formed and all interested turn into the association their repairs at a small price. The selling price is regulated by what the repair men charge. If the repair dealers reduce certain castings ½ cent or 1 cent per pound the association does the same, the stockholders agree to stand the loss, if any, proportionately.

The ultimate success of the undertaking is in doubt. As an investment, however, rumor credits it with earning a fair profit, but its success can hardly be measured by dividends on the stock so much as by the dislodgment of its rivals, which up to date it has not accomplished, and stands simply as one more repair shop in the field. It is young, however, and may in time bring about the result desired by its founders. There are some who consider that the adoption of a more aggressive policy and a greater reduction in prices than was made would more surely dismay the repair men. So far they have not appeared greatly frightened. Whatever may be the outcome of this or any other organized effort that may be put forth, it will not restore to manufacturers the profits on lost sales of repairs during the past ten years, or suffice to destroy the monument erected by themselves to their own masterly inactivity and neglect.

FLATS AND APARTMENT HOUSES.

Having reviewed the second great change in the stove business between 1882 and 1892, we will take up the third, namely, the one due to changed conditions of house building in the city and vicinity.

Previous to 1882 and before the extension of the elevated railroads to their present limits far up town the number of French flats or apartment houses erected had been comparatively small and a good many that were built did not contain the conveniences and furnishings found in those constructed to-day. The architect's plans did not frequently call for ranges except for first class apartments, and tenants were expected to furnish their own stove, the same as in old-fashioned tenements and cheap private houses. But as soon as the people fully realized the great growth of the city and benefits sure to result from rapid transit, and the women had overcome their fears of riding on the elevated cars, the demand for houses in New York set in and the tendency to take up residence in the surrounding cities and towns was checked; building received a boom and the stimulus given to inventive genius by the demand for anything new in the construction of flats brought out hundreds of ideas for the comfort and convenience of people living in them.

Among the first improvements introduced in apartment houses of the middle class, and quite generally too of the cheapest, was naturally hot and cold water, and hence hard coal water-back ranges were first in demand for that purpose, although many different devices have since been introduced, which have divided up the trade. At first these ranges were furnished to the builder by one of the contractors doing other work on the building who included the ranges in his contract—generally either the roofer or plumber. He bought them of the wholesale stove men, carting them to the buildings and furnishing his own labor to set them. As each such flat usually contained ten such apartments and each apartment a range, it is easy for any one who knows anything at all of the growth of New York City during the past ten years to understand that the wholesalers did an enormous business in this particular line. Block after block of these buildings were erected in all the avenues and streets near the elevated railroad stations during the five or six years following 1882, the ranges for each being supplied in the manner stated, and the business by the manufacturers done with simplicity, directness, and free from any complications in relation to the responsibility of the builder or any other person except the one to whom he sold.

CHANGED REQUIREMENTS.

The erection of such buildings has continued since and with little abatement as to numbers, but the conditions with regard to the ranges, both as to numbers used and the manner of supplying the demand, have changed. Other appliances have been invented and used in many cases and coal ranges do not have the exclusive call; in addition to that, the competition of builders to undersell each other forced them to buy closer and caused a cutting of prices by the plumbers and roofers which has reacted on the makers, and when the cuts thus secured failed to satisfy some of the more enterprising or shrewd, they went to the wholesaler direct to buy their ranges and drive their bargains and left them out of their plumber's or roofer's specifications altogether.

Some of the manufacturers for a while refrained from dealing with builders direct for these small ranges, notwithstanding the numbers wanted were generally large enough to hold them unassailable on the ground of retailing, and notwithstanding, too, that the settiug of furnaces and brick-set ranges had always been excluded by manufacturers from their promise not to retail goods. They did so from the commendable impulse to protect the middlemen, whom they considered as justly entitled to an intermediate profit between themselves and the builders; but times have changed, and there is no more room nowadays for old-time conservatives in the stove business, and no living for those who hang on to old-time traditions. The one who holds out the longest is the worst left. It went against the grain to refuse to sell 50 or 100 ranges in deference to a principle that after a while nobody else had any respect for, and so they all finally were in one boat.

(To be continued.)

Banquet of the Reading Stove Dealers' Association.

The second annual banquet of the Reading Stove Dealers' and Metal Workers' Association was held on the evening of Monday, January 23, at Rajah Temple Banquet Hall, in Reading, Pa. Representatives of the Mt. Penn Stove Works and Orr, Painter & Co. were present, together with some 40 members of the association, all of whom enjoyed a very pleasant occasion. After the following *menu* had been duly considered, there were appropriate toasts and speeches which indicated in a striking degree the good fellowship and pleasant relations existing among the trade in that city :

MENU.

Oysters
Celery Olives Pickles
Soup
Broiled Fish and Sauce
Roast Turkey and Cranberry Sauce
Vegetables
Peas Potato Balls Corn
Roman Punch
Fried Oysters
Chicken Salad
Fruits and Ice Cream
Coffee
Wines
Y. B. Cigars.

The committee having the banquet in charge consisted of Lewis Dauth, William Bitting and William B. Loucks. The association holds monthly meetings for the purpose of considering the best interests of the trade. The effort to make the interests of all concerns in the trade harmonious has met with a great deal of success, and as a result, bitter rivalry and ruinous competition is practically unknown. It is said that not even a bond is given by any member to maintain and abide by the rules governing the association, a condition of affairs largely due, it is claimed, to the interest and co-operation of the local stove foundries.

The Southern Stove Works Company

of Richmond, Va., favor us with an attractive copy of a catalogue and price-list which they have issued embracing cook stoves, ranges, heaters, hollow ware, lawn vases, settees, fronts, grates, fenders, &c. The publication is made up of 44 pages of liberal size, bound in colored paper covers, the fourth page of which shows a general view of the company's works. An interesting feature of the publication is found among the opening pages in a number of directions for putting up stoves. The company's latest improvement in cook stoves is the Fitz Lee, a four hole construction of attractive ornamentation and made in six sizes. It is designed for burning coal or wood, and has been brought out to meet the demands of the Southern trade. The oven is large, the flues deep, the anti-clinker grate is heavy and the knob and hinge pins are nickel plated. The panel of the oven door carries a tile bust of ex-Governor Fitz Lee of Virginia, after whom the stove is named. Other members of this class include the Waverley, made in four sizes; the Durham, Tip-Top and the Clipper for wood only. The company's patent detachable reservoir is made to fit any cook stove or range simply by bolting down over the pipe collar of the stove a corresponding collar on the rear of the base for the pipe. Among the heaters the Olivette is the company's latest open-front Franklin. This is a very pretty stove, decorated with nickel and cast ornamentation, and is made in three sizes. The Rescue is a two-hole heater, which can be used for hard or soft coal or wood; the Tidewater, a heavy globe stove made in several sizes; the Norfolk, Pinafore, Farmers' Favorite and Bay are some of the goods to which attention is invited. The closing pages of the catalogue are occupied with illustrations and prices of grates, fenders, vases, hollow ware, &c.

Impossible Stoves.

A Western firm of stove founders send us a postal card recently received which we take the liberty of reprinting. The body of the note, as it appeared, is as follows:

"We have heard of a stove called the 'Retort,' which is said to be made by you folks, which leaves no ashes. It is something new. Please answer."

We are much more interested in the construction of this stove than the correspondent who sent this postal card, for it is a device that has all the necessary features to revolutionize not only the stove trade, but the heating trade as well. A stove that will leave no ashes in burning ordinary coal would be a most interesting affair. It deserves to be classed with a wonderful furnace that was discussed a few years since, in which a roaring fire was obtained (so the inventor claimed) without any updraft in the chimney. In fact, as we recollect the matter, there was a down draft, the voracity of the flame drawing the oxygen of the air from all quarters and annihilating it apparently, for in the description of the device there were apparently no gases given off. That stove, however, left ashes and, all things considered, was a less remarkable affair than the "Retort" that is noted in the postal above quoted.

Traveling Salesmen for 1893.

The Noyes & Nutter Mfg. Company of Bangor, Me., are represented this year on the road by George H. Nutter and Frank E Bell, who cover the State of Maine.

The traveling salesmen who will represent the Weir Stove Company, Taunton, Mass., for the ensuing year are: C. M. Leonard, who will cover Central New England; Edward Fry, the remaining portion of the New England States with the exception of Maine, while the latter territory and New York and Ohio will be covered by N. S. Staples.

The New England Stove Company of Taunton, Mass., are represented in the New England States this year by L. B. West and W. H. Lindsay.

The Sill Stove Works of Rochester, N. Y., have a force of traveling salesmen, embracing R. B. Johnson, who will cover Southern New York and Northern Pennsylvania; B. M. Ross, Eastern and Northern New York, and C. M. Ryan Western New York, Ohio and Michigan. The company's representatives from their Chicago office are W. H. Scott, John J. Walker and H. Chaffee.

The Mount Penn Stove Works of Reading, Pa., will be represented the ensuing year by the same staff of salesmen as last year. Allen W. Ymer will look after the trade in Eastern Pennsylvania and a portion of New York and New England, together with the company's Southern trade, which is not drummed by the Philadelphia house. Harry A. Norton will travel in Western Pennsylvania, Western New York, Ohio, West Virginia and portions of Western Maryland and Virginia.

The staff of traveling salesmen of S. B. Sexton & Son, Baltimore, Md., consists of H. F. Hildebrandt, who looks after the company's interest in Maryland and the District of Columbia; William Stumpfh in the city of Baltimore, and Capt. John Tayloe in the Southern States from Virginia to Texas. In Pennsylvania, Ohio, Missouri, Colorado and other Western points the company have established local agencies.

The Corning Stove Company of Corning, N. Y., have engaged the following salesmen for the ensuing year, who will cover the territory named: E. S. Lindley will look after the company's interests in Western New York and Ohio; C. C. Drake in Central and Eastern New York, George W. Drake in Southern New York and Northern Pennsylvania, and Charles E. Clark in Chicago and the West.

The interests of Noyes & Goddard, successors to Goodell & Co., Waterville, Me., will be represented this year by Oliver Thurston, who will cover the eastern portion of the State; L. F. Wade the western part and T. Danton the State of New Hampshire.

The Perry Stove Company of Albany, N. Y., have arranged with the following salesmen to cover the territory named.

F. Pickering in Ohio; Chas. L. Smith, in Indiana and Michigan; Geo. P. Lynd, Jr., in Western New York and Western Pennsylvania; Geo. J. Day in Central New York; N. R. Bond in Eastern New York; Chas. H. Shepard in New England; A. M. Werum on the Pacific Coast; W. K. Corr in New York City; E. L. Tallmage in New York City; Wm. Van Blarcom in New Jersey, Maryland and Eastern Pennsylvania, and J. M. Litchfield in cities adjacent to New York City.

Crea, Graham & Co. of Allegheny, Pa., have a force of salesmen for 1893 consisting of J. L. McKee, who will represent the company in Western Pennsylvania, Ohio and Indiana; Robert H. Graham in Central Pennsylvania and Virginia; William S. McKee, who will look after the local trade in Pittsburgh, Allegheny and nearby towns, while George W. Stevenson & Brother will act as retail agents in the city of Pittsburgh.

The Portland Stove Foundry Company, Portland, Maine, have a force of traveling salesmen for 1893 consisting of W. H. Wiggin, who will travel in Massachusetts, Connecticut, Rhode Island and lower Vermont, and George H. Lawton, who will cover Maine, New Hampshire and upper Vermont.

The traveling salesmen who will represent the Magee Furnace Company of Boston, Mass., for the year upon which we are now entering include H. A. Tinkham, who will cover the territory west of Chicago and north of Kansas; Rood Brothers Stove & Furnace Company, in Kansas and the Southwest; S. Olin Field, in New York, New Jersey, Pennsylvania and Ohio; J. M. Sweeny, in New York City and immediate vicinity, and S. E. Newell and Jesse Cudworth in the New England States. The company's branch house in New York City is in charge of J. Q. A. Butler, and that in Chicago is managed by A. A. Spear, who travels more or less.

The S. M. Howes Company of Boston, Mass., will be represented in the New England States this year by F. B. Streeter, J. H. Brown and Fred Hall.

Charles Heath & Co.

We are indebted to Charles Heath & Co., with office and salesroom 4 North Liberty street, Baltimore, Md., for a copy of a very neat catalogue of nearly 80 pages, relating to fire-place heaters, stoves, ranges and furnaces. It is bound in colored paper covers in an attractive style. The business of the company has been established since 1854 and a large trade is at present enjoyed. The goods have established a wide reputation and are meeting with a gratifying sale. The leading lines include Heath's Grand Domestic fire-place heater, made with square, circular or French frame; Heath's

Bristol heater, brought out to meet the demand for a single illuminating stove of large capacity; Heath's Chelsea, especially adapted for dining rooms and small parlors; Heath's Domestic Jewel, a low-priced construction; Heath's Domestic range, made to meet varying requirements; the Ideal, Parkton, Kitchen Comfort, Myrtle, New Model, Valley Pride and Gem Welcome ranges. The Damascus, a full revertible flue heater, is fitted with duplex or draw center grate and is decorated with art tile and nickel trimmings. Other heaters include the Vall y Queen, made in two sizes; the Elsie, made in five sizes; the Welcome Bee, Pikeland and Lotus, the latter being a laundry stove made in five sizes. A number of pages are given up to the Royal Empire Ventilating grate and heater, set with art tile; Heath's Active Domestic wrought iron furnace with steel dome, stationary radiators and shaking and dumping grate; Heath's Ideal hot air furnace, and Heath's Grand Domestic hot air furnace. Hints on setting a furnace are presented, together with price-lists of registers; tables giving capacity of pipes and registers; illustrated notice of the Electric oil stove, the Yale gas stoves, Jewel process stoves and vapor stoves, together with Never Break wrought steel cooking utensils, stove boards, waffle irons, &c.

A Soliloquy on Baking.

BY ALFRED ALLEN.

It was guaranteed a good baker—I mean the range I sold to the woman who is kicking. The letter said thousands were in use giving better than average satisfaction, and that house don't lie.

She says it won't bake. Of course it won't. The grub bakes, but the range has got to bake it. There's something wrong that's got to be changed; now how shall it be done? The old plan is to rip her out and send her back. That won't work now, for they told me last time that the stove I sent back worked, and when I was in town they showed me that it would and quietly gave me to understand that to send such a stove back wasn't much credit to my ability or grit. They told me it was all common sense and no mystery, and that if I stuck to it and used experience right I could make a reputation and some money by making

Bad bakers bake beautifully After Alfred Allen's alterations.

Gosh dast if I don't try, and if I catch the bang of it in this one I'll bang that out for a sign. Let me see. Every fool knows heat goes up. Yes, but the oven is down. The bottom of the fire is way up above the bottom of the oven. So how is the heat to get down there. Well, the chimney draws. "Spose" it does, it draws up. Let me see. That chap seems to know a heap, and he said, "Mind you, here is the whole thing in a nutshell: *All of the air that goes out of the top of any chimney must get into it through the fire.*" He also said that kitchen chimneys were often too low and they should never be lower than the highest peak of the main house roof, or wind might blow so as to stop the draft coming up. He said if the chimney was a big old fashioned stone affair it might cool the gases before they got out, then they would drop back and make trouble, and if they did, to run enough pipe up the chimney to make the chimney warm and start her drawing. He said that the pipe should fit into the chimney as near air tight as possible or enough air would go in around it to fill the chimney without any going in through the fire, which would kill the draft, the reputation and the profit, and that last killing is what kills me.

If it had a fireboard in it every crevice must be made air tight by pasting three or four thickness of paper over it, but that it was better to put a throat piece in the chimney and to fill in the crevices between the edges and the chimney with fire clay, dirt, ashes, putty or anything to make it air tight and that it could be done through a hole in the throat piece that could be closed with a slide damper. He said that that would be cheaper than having a second hand stove in stock. Some chimneys have a brick left out so they can be cleaned out at the bottom and sometimes this is in the cellar or on the opposite side of the chimney, and if the brick is loose it lets in air or gets knocked out to let in more. Another hint in the lecture was that a fellow all fired mean who tapered his pipe down small to save a little was likely to make trouble and expense for himself.

Mrs. Jones' range had a 5-inch collar and would'nt work, so I made a piece of pipe 5-inch to fit on the collar and the other end 6 inch and ran 6 inch pipe all the way to the chimney and she brags on her stove now. He said that if the covers and centers were old and warped so they let in lots of air that would kill baking, and I know the widow Jones' stove worked so she said she would'nt trade it for a new one after I got the top all rigged out new and tight.

Azariah Brown used to swear he had the best stove made, but grew faint in his praise after awhile and had me see it, and the trouble was because the grate warped all in toward the fire, so that you could put your hand in the space and the air that went in there was equal to taking a cover off for checking the draft, but a new grate started Azzy's wind instrument again, and he is blowing that stove and me right into the people at the tavern and the church alike. It's his gospel.

Sarah Smith got her stove in town to save something and to show me that I did not own the entire traffic. Well, it wasn't screwed down any too tight and the top jumped up and some of those little nibs that should hold it in place held it up above the front and the air just went in as fast as it wanted to, and besides, a flue strip fell down out of place, and when she got it up it smoked like a boy on his first cigar and drawed like a balky mule. Well Sally was spunky and wouldn't send for me till she couldn't help it, and as she was churchy and stuck on her grammar, I thought I'd cut her comb a little, and when I come I said, "Sal, you've got a durned nice stove and it's too durned bad that it works so durned mean, but I'll do my durndest to make it do its durndest," and I'll be durned if I didn't, and when Sallie paid me she said my expressions were inelegant, but if she had to do it over again she would buy her stove of me.

Well, I've rambled around some through my advices and experiences, and "I want to know." I guess I do know, and I believe I can make that kicking woman's stove bake so her joy will make her kick her old man's hat off. Seems to me I've got it pretty clear now. First, make the chimney draw; second, hitch your stove up with air-tight connections; third, start your fire. And here's how she works: The air goes in among them red hot coals and with the gas starts a blue blaze across the top of the oven, and the damper being closed that hot blast goes down the side flue under the oven and makes it hot, and the swifter the old chimney pulls it down there the more likely that the blue blaze will reach clear around underneath, and if you drill a ¾-inch hole through the side of the oven into the flue you can fry ham in that oven and your neighbors won't smell your breakfast.

There is no surer sign of a bad draft than for a stove to get red hot on top when baking, for then both the fire of red hot coals shines right up there to heat it, and all the heat of that blue blaze stays right there, too, for there is nothing to pull it away, and all the round about turns to get around the flue strips and through the flues is too much for it unless there is a good strong pull. If there is no fire in the stove when you are called to see it, just take off the covers furthest from the fire and if the under side and flues have a nice covering of black wooly soot, you can go your whole pile clear to your shirt that the blue blaze has never been there and the draft wants attention.

Seems to me if I had this soliloquy written down to read once in a while it might be some good to me, for a fellow's head is like a ditch—the trash is on top, but its some trouble to catch the fish. Well, I wrote it off, and like all the fellows who write, I itched to see how it looked printed, and if you print it I reckon I'll cuss like the other fellows if it is criticised too sharp, and I'll have to own I don't know it all, either.

ODD PLATES.

AT THE ANNUAL MEETING of the stockholders of the Carton Furnace Company the following directors were re-elected: E. A. Carton, W. J. Carton, J. B. Jones and James Jones. At a subsequent meeting of the directors, E. A. Carton was elected president and general manager; W. J. Carton, vice-president and treasurer; J. B. Jones, secretary, and James Jones, superintendent of the works. The volume of business for 1892 was larger than for any previous year in the history of the company. The increase in capacity made a year ago was taxed to the utmost in meeting the demand for Carton heaters. The prospects for the year 1893 are considered very promising and the company expect to enjoy a business which will show a fair increase over the past season.

WEIR STOVE COMPANY, Taunton, Mass., are distributing a neat little folder illustrating their Glenwood stoves and ranges, which they claim to be as near perfection as highest grade material and skilled labor can make them. The covers present bright-colored landscapes with settings of heather and forget-me nots.

EUGENE MUNSELL & Co. of 218 Water street, New York City, have just issued a 12-page folder relating to their lines of Manhattan and Reliable gasoline stoves. The Manhattan Juniors are made 14 inches high and with giant burners, thus increasing the power to that of their high stoves. The company say that their line this season is more extensive than ever before, as they have added several new and elegant styles. The Reliable vapor stove, for which they are Eastern agents, embodies the modern features, and has established a wide reputation. Illustrations are given of the Reliable Generator Manhattan full flued ovens and of the Manhattan plumbers' and tinners' furnace. A feature of the circular is found on page 11, consisting of instructions for taking care of a gasoline stove.

AFTER HAVING been shut down several weeks the Bussey & McLeod Stove Company of Troy, N. Y., resumed operations Tuesday, January 14. The first casting was made the following Thursday.

A HOT-AIR FURNACE forms the basis of a patent recently issued to Thomas E. Martin of Des Moines, Iowa. The fuel magazine has an open flaring bottom, with parallel side walls that extend forward from the combustion chamber. An air distributing tube extends from the side walls at the bottom of the rear plate of the magazine, at the open bottom of which is a grate. A bridge wall,

or its equivalent, is placed at the rear edge of the grate, while an air-distributing tube extends parallel with the top of the bridge wall. A chamber is in the rear of the air-distributing tubes, into which the products of combustion pass rearward between the two parallel air tubes already mentioned. A one-half interest in the patent has been assigned to Isaac T. Martin of the same place.

THE PARIS STOVE COMPANY of Troy, N. Y., have started up again with a full force of men. Many repairs were made and inventory taken during the two weeks' shut down. About 70 men are employed and there are enough orders on hand to keep the plant busy for some time to come.

THE WORKS OF THE Walker & Pratt Mfg. Company in the block 31 and 35 Union street, Boston, Mass., were visited by a disastrous conflagration early Wednesday morning of the present week. The company's building is a four-story brick structure with granite front on Union street, and covers 5396 feet of ground. It runs back into Creek Square, which has more than half a dozen outlets on the streets surrounding the block. The flames were first discovered on the upper floors of the building, and so rapidly did they spread that it was difficult to fight them. Three alarms were sent out, and before the flames were extinguished they had communicated with a number of adjoining buildings. The Boston papers state that the company carry an insurance of $60,000 on their stock, which is thought to be ample to cover their loss.

FOR SEVERAL YEARS past retail hardware and house furnishing dealers who handle gasoline stoves, have often been unable to receive their stoves when the season opened, the reason being that they did not order until within a week or two of the time they were in need of the stoves. The Quick Meal Stove Company, St. Louis, Mo., are receiving a large number of advance orders and anticipate a heavy trade. They urge their customers to place their orders early and thus receive their stoves when needed.

ALBANY'S STOVE MEN figure prominently in the management of the city's financial institution. At the recent bank elections the following were made officers: Merchant's Bank, Jasper Van Wormer, president of J. Van Wormer & Co., elected a director; Park Bank, Grange Sard, vice president of Rathbone, Sard & Co., elected a director; National Commercial Bank, Nathan B. Perry, president of the Perry Stove Company, elected a director. Mr. Grange Sard was also named as one of the board of directors of the latter bank.

A VAPOR STOVE possessing a number of interesting features of construction forms the basis of a patent granted on January 3 of the present year to John E. Donovan of Cincinnati, Ohio. The stove is made with three burners, but is so constructed that two may be employed if desired. Each burner has an independent vapor mixing tube and a common vaporizing chamber. Each has independent valves for controlling the supply of vapor, while the branch tubes from each of the mixing tubes have nipples which are placed in close proximity to the common vaporizing chamber. The top of the stove is of ordinary construction, except the central grate opening, which is enlarged and of oval form, so that the three burners may be brought together under the grating when it is desired to concentrate the heat of all at this point.

W. B. HATHAWAY, for some time secretary of the North Dighton Co-operative Foundry Company, has associated himself with the Smith & Anthony Stove Company of Boston, Mass., and will soon visit his old friends in the trade in the interest of the Hub line of goods.

THE AMERICAN ELECTRIC HEATING COMPANY of Boston, Mass., are the assignees of a patent granted to Willis Mitchell of Malden, that State, for an electro-magnetically heated receptacle. The invention has for its object to utilize more perfectly in electrical heaters for household and other purposes the heat derived from magnetic lag in addition to that derived from resistance. The magnetism is generated in the bottom of the receptacle or vessel composed of magnetic metal. The inventor provides the bottom or body of the vessel with projecting studs or cores to which heaters including wire helices in electric circuit are applied, but the studs of the body of the vessel are of magnetic metal.

THE GIRARD STOVE WORKS, Girard, Ohio, manufacturers of Adelbert stoves and ranges, are doubling their capacity and are adding to their line of stoves for the fall trade a complete assortment of oak stoves. This concern expect to turn out during this year about 8000 stoves and ranges.

THE LIEBRANDT & MCDOWELL STOVE COMPANY, with Philadelphia office at 123 North Second street and Baltimore office at 22 South Charles street, have issued a circular under date of January 6 to the effect that they have arranged to job a full line of gasoline stoves during the coming season. Salesmen of the concern will visit the trade at an early date to take orders for these goods.

THE SCANTLIN FOUNDRY COMPANY, successors to Thomas Scantlin & Son, Evansville, Ind., send us a neat catalogue of 48 pages relating to their leading specialties. The Jewel Home cook stove for coal or wood is an entirely new construction elaborately ornamented and embodies the modern features. It is made in a variety of styles and sizes and is referred to by the makers as a splendid baker. The Grand Home and Magic, for coal or wood; the New Home, Bright Home, Denver, Nora and Toy Home, for burning wood only, are some of the other goods presented. The heaters include the Red Oak, made in seven sizes; the Lamasco, an all-cast cylinder stove for hard or soft coal; the Oriole, an attractive cannon; the Trent, shown with and without drum; the Harold, Myrtle, New Todd, Oakland and Texas. A list of stove hollow ware completes the volume.

CREA, GRAHAM & CO. of Allegheny, Pa., state that trade has opened very satisfactorily for the new year, and if it continues in the same proportion during the remaining 11 months of the year they will have no complaints to make.

AN ENTERPRISING MILKMAN in the Northern part of the Empire State has invented a novel arrangement by which he keeps his milk from freezing. He has not applied for a patent, and probably does not even contemplate doing so. In the center of his wagon he has a box, and in the box a small stove. Around the box he sets his cans of milk. His device works to his entire satisfaction.

W. W. DUNNINGTON, who for many years represented the Chicago house of the Michigan Stove Company in Kansas and other Western States and later in the Indian Territory, has recently established himself in business at Westfield, Ind. One of the features of Mr. Dunnington's store is a combination steel range with 30 gallon iron water boiler and natural-gas boiling attachment made by the company named, and which was presented by them to Mr. Dunnington as a Christmas present on the occasion of his retiring from their service. This range, we understand from a local paper, is set up in the store on exhibition until Mr. Dunnington goes to housekeeping. With the range is a letter of presentation handsomely framed, together with a splendid picture of all the traveling representatives of the Michigan Stove Company taken in a group while Mr. Dunnington was in their service.

RATHBONE SARD & CO.'s Albany, N. Y., plant has opened again, after inventory and repairs. Their traveling men are on the road and the company report that there is every prospect of a good year's business.

THE PHILLIPS & CLARK STOVE COMPANY of Geneva and Troy, N. Y., have issued a neat calendar in the shape of a combination diary and memorandum pad. It is what is known as the "daily reminder," and is intended to serve not only as a calendar for the year, but its especial use is to remind one of things to be done each day, thus filling the place of an office diary. This is mounted upon a cardboard easel which can be placed upon the desk or hung on the wall by means of a cord. It is so arranged that all the leaves but the last on the left side are folded back to the right and one leaf turned over every two weeks thereafter. A yearly calendar occupies the left-hand portion of the cardboard easel, while at the right is a calendar for 1894. Across the top of each page of the daily reminder is the month, the number of days it contains and the figures 1893. Each page is ruled off into seven spaces, there being one for each day in the week. The printing extends down the outer edges of the pages, leaving four lines for memorandum purposes. This form of calendar is proving very popular with the trade, as it serves a double purpose and is both useful and ornamental.

WE ARE INDEBTED to the Somerset Stove Foundry Company, Somerset, Mass., for an exceedingly pretty calendar for the new year. At first sight it appears to be one of those red fancy bags that are often seen about the house, but is made of cardboard and bears upon one side a panel picture in colors. The upper part of the panel carries the name and address of the company and an indication of the line of goods manufactured. Attached to the lower portion of the card are a number of white slips giving the days of the week and month for 1893, a feature of which are records of a number of Columbian events. On the last slip is a biographical sketch of Christopher Columbus. We also have from the company a poster embellished with a colored design of a striking character, and arranged for hanging upon the wall. Attention is invited to the Somerset Grand, New Grecian, Wyoming and Matron ranges, as well as to the New Somerset Arion and Cheerful cottage parlor stoves. The foundry of the company has been running steadily to meet the increasing demand for their goods and the statement is made that during the past six months their business has doubled in volume. The company are conveniently situated on the Taunton River, so that all material is loaded within 100 feet of their cupola. The present business was established 16 months ago, and at the end of ten months paid a dividend of 6 per cent. and are now about paying another of 3 per cent. They are bringing out a new range adapted to meet the requirements of the Western trade. Their interests on the road are looked after by F. E. Grinnell, who covers the New England States.

SCHWAB & SERCOMB of Milwaukee, Wis., manufacturers of the Gilt Edge furnace, take a very cheerful view of the situation. They operate a large foundry and make a number of other specialties in addition to furnaces, having full work assured for the coming 12 months. The pressure on their capacity has latterly

become so great that they contemplate extensive additions, taking in considerably more space than they at present occupy. As the tendency is persistently toward lower prices, and the margin of profit in manufacturing is steadily being reduced, they must depend on a larger output to secure satisfactory returns from their investment of capital. Their sales of the Gilt Edge furnace in 1892 were double those of 1891, making the third consecutive year in which the sales of the preceding year were doubled. E. E. Dunning will continue to manage the furnace department and attend to sales in Milwaukee and vicinity. C. H. Borradaile will represent the firm in Michigan, Wisconsin and Minnesota. W. N. Shandrew will cover Iowa, Illinois and part of Indiana. The success which has been won by the Gilt Edge furnace has not made the manufacturers satisfied with the results accomplished, but further improvements will be made in it the coming season to render it still more popular.

The Eagle Stove Foundry Company of Fall River, Mass., are enjoying a very good trade and as yet have no cause to complain. Their goods meet with a ready sale throughout the New England States, as well as some portions of the West. A feature of their business is the large demand for sinks in the home market.

Henry N. Clark, 103 – 105 Blackstone street, Boston, is sending to the trade a novelty in the shape of a diminutive calendar attached by a bit of ribbon to a neat pen piper. Printed on the outer cloth is the name and address of the donor and his trade announcement as dealer in stoves, repairs and supplies of all kinds.

The Milwaukee Gas Stove Company are now comfortably housed in their new location at 15 and 17 Erie street, Milwaukee, Wis. They occupy a building five stories high, covering a ground space of 40 x 90 feet. Although much larger than their previous quarters, the building hardly accommodates their steadily growing trade. Their new Perfection gas range has a number of interesting features. The pressure of the gas on the burners can be regulated by a set screw, which diminishes or enlarges the orifice in the feed pipe beneath the valve, so that the stove can be adapted to the use of high-pressure natural gas or manufactured gas. This enables the stove to be more efficiently operated than if the pressure were merely regulated by the usual needle valve. This set screw has its seat in the same casting as the valve. The air supply is also regulated by a wheel. A telescopic oven burner is used for lighting the oven to avoid stooping by the operator. The water-heating attachment has two cooking holes to utilize waste heat from the gas used in heating water. A separate water heater is made, which also has a telescopic arrangement for the burner. The whole burner is pulled out and lighted, then pushed back in its place. This avoids the danger of an unskillful operator turning on the gas and filling the heater with it before lighting, which causes a puff of flame and often results in accidents. An ingenious device is used for cleaning the holes in the burners. A wire frame holds a wire in place for each hole in the burner, and a touch of the hand pushes them through all the holes simultaneously, cleaning them instantly. A new range is to be brought out shortly, with a small top, for use in flats and small kitchens, in which space must be economized. A branch house has been opened in Chicago at 128 Michigan avenue.

The Central Oilgas Stove Company are pushing with a great deal of enterprise the sale of their specialties, prominent among which is the Oilgas lamp stove, made 14 inches high, 10 inches square at the base, and a top grate measuring 10 inches square. Taking in the width of the extension shelves the top measures 18 inches. Their Oilgas cook stove is provided with improved burner, the exterior wall being perforated. Improvements in the way of elevated warming shelves have been added to the stove for this season's trade.

Associate Manager Edmund Raftery, of Rathbone, Sard & Co., was in Albany, N. Y., the other day, having returned from London, where he spent the holidays with his family, who are sojourning abroad. He looks well and reports having had an enjoyable trip. He will now settle down in his busy life at Chicago, where he devotes all his efforts to furthering the interests of the Acorn stove manufacturers.

The Smith & Anthony Stove Company of 48 to 54 Union street, Boston, Mass., are making their new steel plate furnace known as the "Hub" heater in six sizes. It has a brick-lined fire pot, steel plate radiator, triangular dual grate, steel plate flues, deep ash pit, automatic damper pull and other features which go to make up a first-class construction. The patent automatic damper prevents the escape of gas into the cellar when the feed door is opened for the purpose of replenishing the fire. This is among the latest additions to the company's line of heaters and in its construction have been embodied the desirable features known to the trade. The return base flue has an air space between it and the base proper, thus allowing the air to circulate on all sides of the base flue and very largely increasing the heating power. The diameters of the casings of the various sizes range from 37 inches in the smallest to 60 inches in the largest, while the diameter of the fire surface ranges from 18 inches in the smallest size to 32 inches in the largest. We understand that the Hub heater can be furnished in portable form or adapted for brick work, as may be desired.

C. C. Drake of the Corning Stove Works, Corning, N. Y., is enjoying a vacation in Florida, and is expected to return by February 1. He is accompanied by James A. Drake, treasurer of the company, and it is confidently predicted by friends in the trade that they will probably return fully equipped with "crocodile yarns," with which to capture business.

W. F. Greene of Troy, N. Y., has just returned home from a month's business trip through the West, where he visited the leading stove concerns interested in the line of specialties he manufactures. Mr. Greene reports the results of his trip as very gratifying, and considers the outlook for the year bright and promising.

The Kernan Furnace Company of Utica, N. Y., have elected the following officers: President, Francis Kernan; vice-president, W. J. Owens; secretary, W. H. Landers; treasurer, Joseph F. Kernan.

An article having been published in a late issue of a Portland, Ore., paper to the effect that some of the Eastern stove manufacturers who had established branches in that city were about to discontinue them, the Bridge & Beach Mfg. Company and Cribben, Sexton & Co. wish to assure their friends and the trade at large throughout Oregon, Washington and the territory tributary to Portland, that the statement does not apply to them. The liberal encouragement the concerns named have received from the trade in the sections noted is sufficient evidence, says a circular letter issued under date of January 16, that the establishment of a Portland office and warehouse was not a mistake in any particular, nor has it proven a mistake "for two large stove manufacturing concerns to join together in a joint distribution and warehouse arrangement," as the companies named have done in Portland. It is stated that a large stock is carried in the Portland warehouse and that customers' orders are promptly filled.

The Perry Stove Company of Albany, N. Y., are offering the trade an interesting assortment of oil stoves made under the name Royal. These range in size from two to four boiler holes in the top and are finished in nickel in an attractive manner. The Royal lamp stoves are well made and are said to be meeting with a very gratifying reception. The construction has been improved for the season of 1893 and is now said to be strictly first-class in every particular.

Alfred Gracey of the Co operative Foundry Company, Rochester, N. Y., has gone on a Western trip as far as Denver.

The Superior Stove Company, South Superior, Wis., have issued a neat circular to the trade, illustrated by means of a diagram showing the levels of the Great Lakes. The company are situated at the head of Lake Superior in the midst of an extensive iron region and they present the diagram referred to as affording information which it is well to know. The company also state that it is a good thing to know that they manufacture a full line of stoves, ranges and furnaces.

Abram Z. Allis, Prattsburg, N. Y., has patented an oil stove, the burners of which are so constructed as to be easily accessible for lighting, cleaning, trimming and extinguishing. Simple means are also provided for directing escaping heat through draft holes located behind the main opening for cooking utensils. A one-third interest in the patent has been assigned to Henry T. Wurth and Thomas H. Flynn of the place named.

The Auburn Stove Foundry Company, Auburn, Maine, held their annual meeting a few days ago at which H. Wesley Hutchins was elected president and Thomas H. Roberts treasurer. The report of the latter showed a gain in sales over 1891 of 27 per cent. A dividend of 6 per cent. was declared, payable on or before February 1, and of the $13,000 stock remaining in the treasury $6,500 was taken at the meeting named.

The Ironton Stove & Range Company, with a capital of $50,000, have been organized at Ironton, Ohio, for the purpose of manufacturing and selling stoves, ranges and castings. The incorporators are: W. C. Amos, H. D. Newcomb, H. A. Keye, Martin Schreiber and O. R. Johnson.

The Huette-Barler Mfg. Company, 111–113 Lake street, Chicago, have issued a bright little circular entitled "Æsop Up to Date." It is an illustrated fable of the elephant and the frog, from which a moral is drawn which leans naturally and logically to a consideration of the special merits of Barler's Ideal oil heater.

The Michigan Stove Company have brought out a new fence sign for the convenience of agents in advertising in their immediate localities. It is a diamond-shaped blue and white water-proof card, 7¼ inches square, bearing an artistic reproduction of the Garland trade mark. When once in position, this device is as nearly a permanent advertisement as anything can be.

The Chicago Economic Fuel Gas Company, 148 Michigan avenue, Chicago, report that there are over 4000 gas stoves and ranges used in that city. Of this number many are supplied with natural gas. There are also over 500 furnaces and other heaters in which natural gas is used for fuel.

James B. Taplin, president of Taplin, Rice & Co., Akron, Ohio, died January 23, in his 81st year.

Stove Discounts and Terms.

The following circular, dated January 11, is sent out to the trade:

From this date and until further notice the discount from our list prices on stoves, ranges, furnaces, &c., not marked net in our catalogue, will be 30 per cent.

In addition to the above discount, all bills settled by cash payment on or before the 15th of the month *succeeding* month of shipment will be subject to a discount of 10 per cent.; all bills settled by cash payment between the said 15th and the last day of the same month will be subject to a discount of 6 per cent.; all bills settled by note due on or before 60 days from said 15th of the month will be subject to a discount of 5 per cent.

All bills remaining unsettled on the 1st day of the month after the said 15th will not be subject to any extra discount.

Accounts will not be extended beyond four months from date of shipment.

Bills of goods for spring stock shipped during February and March will be dated April 1.

Bills of goods for fall stock shipped during June, July and August will be dated one-half September 1 and one-half October 1.

Post Office Lock Repair Shop.

The item of locks is necessarily a very important one in the expenditure of the Post Office Department, and the cost of repairs forms a large proportion of the annual disbursement in this channel. We are informed by the Postmaster-General's report for the fiscal year ending June 30, 1892, that the cost of repairing post office locks averaged, until recently, $40,000 a year, and that the growth of the mail service necessitates an increase of 15 per cent. in new locks annually. According to Mr. Wanamaker's report, however, a very material saving has latterly been made in this direction through the Government having undertaken the trade of repairing the post office locks in their own repair shop. The result has been satisfactory in every way, and it is stated that a sum of $45,000, which had been specially appropriated by Congress for the purchase of new locks, was in 1891 returned into the Treasury as a result of the saving effected by the new system.

It appears that formerly the practice in the Post Office Department was "to buy new locks and keep them in order by contract, one concern practically monopolizing the contract for new and the repairing of those already in use. The same concern for ten years as well controlled the Government's requirements in the way of keys, chains and cord fasteners. The tendency could not be otherwise than to encourage the purchase of new locks as well as other equipment." The natural inference is that it was to the interest of the contractor to do the repairs lightly, so as to have the locks come back oftener to his shop, also to shorten the life of the locks, condemning them as unfit for repair in order to supply new locks.

It is stated that the Government, under the contract, agreed to dispose of 200,000 locks so condemned as scrap at the rate of 20 cents for 300, these same articles having been purchased for 57 cents each. They were, however, turned into the Government repair shop, and at a cost of 6 cents each have been made equal to new. The contract having expired it was determined to undertake the work under the direct supervision of the Department; and the report states that "four years of trial has demonstrated—first, that where the average cost per lock by contract was 34 cents the work has been done at less than 10 cents each, and it is believed that the duration of the contract work was not half as long as that done under the Department's direction. That is to say, a lock repaired by contract was liable to be shopped twice in the same time it is shopped once under the present arrangement."

Flat keys, too, for which the Government was paying from 15 to 20 cents each, are now being turned out of the repair shop at a cost of less than 3 cents, and the character of the work is said to have greatly improved in both locks and keys, while the cost is steadily declining.

The Postmaster General says the Government repair shop is now in good shape for doing its own lock making as well as repairing, and he strongly deprecates any return to the old contract system.

An Experiment in Heating and Ventilating.

An interesting experiment in heating and ventilating a private house is described in the *Popular Science*. In a house built on marsh land, with a river on either side, and surrounded by houses, some of them stained with damp to the hight of 6 feet or 7 feet, this house of 14 rooms was kept both warm and dry by the use of "10 tons of English household coals per annum." Indeed, so extreme was the dryness that it became necessary to place a large number of plants in different parts of the house to afford moisture and prevent the furniture from cracking. The entire house was so thoroughly warmed that doors and windows were constantly opened, "and this in spite of the exceptionally cold and damp nature of the surrounding soil and the exposed condition of the house." The walls of the house are made of porous bricks, and these walls are double, with a space between them, "like one box inside another box, with a space of 4 to 5 inches between the two boxes." The furnace is placed outside the cellar, at the back of the house, and the heat and smoke from it "pass into a chamber built in the cellar." "From this cellar and going all round the outer walls of it there is an inclosed passage," in the center of which is suspended a "metallic flue" that answers as a chimney and warms the air in the passage. In order to retain the heat the walls of the passage are covered with "sluck wood," which is well known as a non-conductor. The ten inlets for fresh air are covered with "metallic gauze." The air warmed in the passage described, which is kept at a temperature of between 114° and 122° F., rises between the openings in the wall and comes out in the large attic under the roof of the house. The success of this system of ventillation is dependent in a large measure on the porousness of the walls, and for this reason they are neither papered, painted nor plastered, but hung with woolen tapeatries tacked on wooden frames. It is claimed that such covering maintains the warmth of the walls, and that the disagreeable sensations we sometimes experience when it rains are the result of moisture "blocking up the pores of the walls." Contrary to the usual theory that worsted wall coverings are a menace to health, M. Somesco, the owner of the house, calls them his "microbe traps," and adds: "If I have any reason to believe that injurious microbes have been introduced into my house, I know pretty well where to find them. It would take but little time or trouble to unhook all this drapery, and put it into the disinfecting oven; and there superheated steam under pressure, without injuring the cloth, would assuredly kill the microbes."

We regret to announce the death at his residence in New York City of Henry E. Russell, president of the Russell and Erwin Mfg. Company of this city. Mr. Russell, who had reached an advanced age, had suffered from ill health for many years, and had practically relinquished active work in connection with the concern. The end came, however, somewhat unexpectedly, from sudden heart failure, on the night of Thursday, the 26th inst.

The Relations of Chemistry to Foundry Practice.—I.*

by Clemens Jones, M.E., Easton, Pa.

Chemical analysis has for its objects the detection and estimation of the constituent parts of material substances. That it proceeds upon an original separation of compound substances into the elementary substances composing them, and upon a positive identification of these, is an inference readily derived. This process began in an original way, and then became selective. The metals were early discovered to be elementary. As far as our present purpose is concerned, from the nucleus of metals—gold, silver, copper and iron—sprung the long list of elements we now have—64. In later years this has been still further increased. The prolonged, arduous work that established the identity of a single element would make a history of experiments. It would likewise be a history of the patience, skill and devotion to science of a class of men—theorists—who spent their lives in a tireless search after truth, and in its demonstration. From the nature of things, chemistry is an experimental science. An experiment has been aptly defined as a question addressed to nature. Chemistry demonstrated by just such inquiries the broad theorem that matter is indestructible. So grand a principle as this applied to all manner of substances—solid, liquid and gaseous. But this principle demanded that the chemical action of one substance upon another should be accompanied by a change of state, in which the weight of the substance changed should remain unaltered. Therefore, the quantity of the substance changed could be accurately determined, because the existence of fixed laws governed every change. Quantitative analysis became a possibility. By it a substance in whatever state of change or combination could be identified, extracted, exactly weighed and then resolved into its former condition without loss. Water could be split up into its component gases—hydrogen and oxygen. These gases could be separated, weighed, found to exist in the proportion of two parts of hydrogen to one part of oxygen, reunited, chemically combined by a spark and then give precisely the weight of water first taken, and possessing all of its original properties. All material substances, whether in the earth, the sea or the air, could be isolated and their quantities determined with an unfailing accuracy. The

* An address before the Foundryman's Association of Philadelphia.

proofs surround us. The products of a hundred industries; the forces at work in operating them—iron and copper; heat, power and light. Indeed, in this our day we are aware that the truths of chemistry and its great principle, developed by means so simple as analysis, expand with the growth of knowledge, and extend from the earth to the limits of the celestial system. Certain of the elements so far found in the earth have been discovered in the sun, and even in the remote planets. How much do we owe to this mistress of our civilization—the benefactress of art, philosophy and religion?

The elements, for which we are thus indebted to the researches of chemistry are accordingly the total number of separate indivisible substances found to have entered into the composition of every known body. A compound body may consist of only two elements, as water, for instance, or it may contain more, as sugar, composed of three elements, hydrogen, oxygen, and the third, carbon, or limestone, oxygen, carbon and calcium. Consider that the same principle of chemical constituency holds good for every material body in the organic or inorganic kingdoms. Sugar can be artificially made. Limestone is found to be a proportionate relation of oxygen, carbon and calcium. These elements, then, brought together in the same association produce limestone, or calcium carbonate, which artificial product has properties similar to the naturally occurring substance. The list of elements which concerns the limits of this discussion is as follows: Iron, carbon, silicon, phosphorus, manganese, sulphur, aluminum, arsenic, titanium, copper, calcium, magnesium, and allusion will be made to a few of the more rarely occurring elements—nickel, chromium, tungsten, vanadium and uranium.

Iron.—Chemically pure iron—that is, iron as pure as it can be made—is silver-white in color, soft, ductile, malleable, and rapidly attacked by oxygen. It forms two principal oxides—ferrous oxide, or iron protoxide, of which the salts are green in color, and ferric oxide, or iron sesquioxide, of which the salts are yellow. There is a black oxide also, which is a combination of these two oxides. When oxidation of metallic iron takes place rust is formed. There are two kinds of rust. One is yellowish brown, inclining to a reddish hue; the other is black and tends to form the magnetic oxide. In impure iron the agency of moisture, even in moderately dry air, facilitates this rusting action. The reason of this is that iron decomposes water, which, as you are aware, is composed of the two gases hydrogen and oxygen. The strong attraction or affinity of iron for oxygen splits up the water into its elements; the oxide of iron, or rust, is formed, and hydrogen is liberated. A clean nail placed in a tumbler of water will show this reaction in a few minutes. Iron may be obtained in a state of purity by reducing the oxide in a current of hydrogen. That is, the oxide is heated to facilitate the action, while a current of pure hydrogen gas is passed over it. Aided by the heat, the hydrogen seizes upon the oxygen, metallic iron is left behind, with water as a by-product. Under these conditions it is in a finely divided state, and must be kept from contact with the air, as it is so eager for oxygen that the air acts fire to it, a brilliant flash takes place, and the black magnetic oxide is formed. This phenomenon is familiar about the runners of a blast furnace, or in filling a ladle from a cupola, and frequently on pouring into a mold. The tiny sparks that fly about like little meteors are minute detached particles of iron thrown into the air, which are burned by the oxygen of the air. Iron is not found in the native state on the earth. It is found in meteorites, those peculiar structures which fall to the earth from masses revolving through space, when they pass through the field of the earth's attraction. Nickel is always conspicuously associated with it. In some places, notably Greenland, these masses of meteoric iron are of great size. From the readiness with which it is oxidized, dissolved and reduced, iron forms a great variety of compounds or salts with other chemical reagents. It is indispensable in the arts, in medicine and in the vegetable world.

Carbon.—Carbon is one of the most remarkable elements which we will discuss. As a solid, it occurs in three distinct forms, bearing no resemblance whatever to each other in outward appearance or physical properties. Color, specific gravity, hardness, crystalline character, all differ to such an extent as to have no apparent relations. The first form is the diamond. This, the most valuable and beautiful gem in the mineral kingdom, is pure carbon. It is the hardest of all known bodies; is employed for cutting glass, and will scratch the hardest substance. It can only be cut by means of its own dust, and then it has a high refractive power, a ray of light causing it to gleam with brilliant luster. When burned in oxygen it is found to consist entirely of carbon. The second form of carbon is graphite or plumbago. This is greasy to the touch, so soft that it can be cut by the finger nail, and is very light. Drawn across paper it leaves a black mark, and is hence made into lead pencils. It is also used for lubricating machine bearings and to protect the surface of coarse grains of gunpowder. Pig iron on cooling throws off flakes of graphite, the so called "kish." The third form of carbon is charcoal. Its purest form is lampblack. When animal or vegetable matter is heated to redness in a closed vessel charcoal is produced. Charcoal carbon also exists as coal, coke and animal charcoal. It is still lighter than either of the two foregoing forms of carbon, and, unlike them, does not crystallize. It has a high absorbing power, which is utilized for the purpose of refining raw sugar, and is valuable as a disinfectant. The wide disparity between these three forms of carbon is evident from the description. Yet on combustion with oxygen each of these yield the same weight of the same substance, namely, carbon. That is, 12 parts by weight of each of these substances yield 44 parts by weight of the resulting compound of carbon with oxygen, carbon dioxide, or, as commonly known, carbonic acid. This metalloid, as we shall see, has a department with iron which cannot be supplied to metallurgy by any other element. Its rank in the physical world, animal and vegetable, is so vital that neither plant nor man could exist without it. We burn it in our stoves to get physical heat, and consume it in our bodies to supply the waste of tissue. For the purposes of the metallurgy of iron we win carbon from the earth, where its geological position proclaims it to have been buried for ages.

Silicon.—Silicon is the next element to be considered. After oxygen, silicon is the most abundant element in nature.

It has never been discovered in the free or native state, but by means of a powerful electric arc current it has been reduced from its oxide. Heat more intense than the blast furnace gives, aided by the electrolytic action of the current in the presence of powerful reducing agents, is required to do this. Silicon may be crystalline or amorphous. In nature it occurs as the oxide, or silica, as in quartz, which is crystalline, or as flint, which is dense and hard and sometimes black in color. Both varieties are sometimes hard enough to scratch glass. Silica is a predominant constituent of all rocks; hence it is found in all kinds of ores, either as silica compounds or as an impurity. In the materials out of which iron is made—ores, fuel and limestone—it is the largest impurity. The slag which comes from the furnace in the manufacture of iron is therefore a compound of silica; that is, it is a silicate. In consequence of the heat and intense reducing power and volume of the blast furnace small quantities of silicon are produced, which, in contact with melted iron, combine with it and make a more fusible alloy.

Phosphorus.—As an element, this metalloid enters into the composition of many important bodies. It has been found wherever organic life exists. The oldest rock formations also contain it, usually associated with iron.

Soil, which is produced by the disintegration of rocks, derives in turn its phosphorus from them. Water, air, and the sun decompose even granite rocks, by the familiar action known as "weathering." Plants, and hence their seeds, take up the phosphorus from the soil, and by this process are said to impoverish it. Animals and man absorb from vegetable matter the phosphorus which enters into the composition of their tissues and bones. Phosphorus does not occur in a free state in nature, but in combination with oxygen and calcium. As the former, which is called phosphoric acid or the pentoxide, we thus see that it existed first in the rocks, then by the economy of nature in the soil. Entering the plants, on which animal life subsists, it is transformed into bones, &c., by uniting with calcium oxide, or lime; on burning these it is obtained as calcium phosphate, or phosphate of lime. We are aware that soils are enriched by the use of artificial, and naturally occurring phosphates. Phosphorus is a soft, yellowish, semi-transparent, waxy solid. It absorbs oxygen rapidly, and hence is easily inflammable on exposure to the air. It burns to phosphoric acid, or the pentoxide. It is largely used to make a composition for friction matches, and gives to them the "phosphorescence" visible in the dark and a disagreeable suffocating odor, caused by slow oxidation. Phosphorus is the most persistent element in its association with iron. Apatite and phosphorite are two of its principal forms, which are often separated from the raw ores to purify them for metallurgical purposes. As affecting iron, the greatest ingenuity has been exercised in the control or elimination of phosphorus, since it imparts properties of varying character, which will be described further on in our discussion.

Manganese.—Manganese is a true metal, reddish white in color, so brittle that it can be readily powdered and is so hard that it will scratch glass. It is slightly heavier than iron, and like that metal decomposes water at ordinary temperatures, with evolution of hydrogen. It is widely distributed in the mineral kingdom, and is found almost as diversely as iron. It is a common ingredient of iron ores. Metallic manganese is said to be slightly magnetic, but owing to the difficulty of making it chemically pure, this property may be due to presence of iron in minute quantity. It has a strong affinity for oxygen, which it is capable of retaining to such an extent that in the arts its oxides are invaluable. It is not found as a native metal, owing to this susceptibility, but occurs as the various oxides, chiefly as the black dioxide or pyrolusite. This substance when heated alone gives up oxygen, and is hence largely used in making oxygen gas. Manganese forms highly colored salts, which are not only useful in making colored tints in the manufacture of glass, but in making valuable reagents for the chemical laboratory. When manganese is reduced from its ores in a blast furnace it is found to unite with carbon and silicon in much the same manner as iron, and can be made into a product containing

iron, called spiegeleisen or "spiegel," or a variety called ferromanganese, which may contain 80 per cent. by weight of metallic manganese. These two alloys are used in the manufacture of steel by the Bessemer process. Manganese is an extremely useful element and, as we shall see, has important effects upon the properties of cast iron.

Sulphur.—Sulphur occurs as free or native sulphur in yellow finely shaped crystals, and is found abundantly in volcanic regions. It takes fire easily and burns with a bluish flame to sulphur dioxide, giving off offensive odors. It is used in making matches. Sulphur is plentifully distributed among the minerals and ores of the whole globe. The extent to which it became associated with all metallic groups is indicated by the amount of sulphur-containing ores used in smelting the rarest metals—gold, platinum, silver and a number of others. As examples of this widespread distribution, copper, lead, zinc and even iron are metals smelted from sulphurous ores. To the early workers at metallurgy sulphur was a much dreaded ingredient, and even with modern chemical knowledge and mechanical appliances it is a baneful and capricious element. To the old iron workers it was one of the "devils." Combined with iron, a common and abundant mineral called pyrite (sometimes "iron pyrites") furnishes the material for making one of the most important acids in use—sulphuric acid, commonly called vitriol. The by-product from this process, so-called "purple ore," is considered by some misinformed persons to be a suitable substance for making into pig iron. This same mineral, pyrite, is found in limestone, in anthracite coal, in bituminous coal and hence in coke, and is termed by miners "coal brasses" and "sulphur." It can be easily understood in consequence why, with ores comparatively free from sulphur, this unfaltering companion finds its way into pig iron or any kind of iron or steel produced therefrom. Together with its occurrence with the ores of iron another mineral containing copper is also found. We will endeavor to point out to what extent sulphur is harmful in cast iron.

Aluminum.—Aluminum is the next element to which our attention is directed. This metal, through the publicity given to recent modes of cheap extraction, is tolerably well known. It is a silver white soft metal, capable of being hammered to the thinness of gold foil or drawn into the finest wire. It is but little over twice as heavy as water and three times lighter than iron. Weight for weight it has nearly the strength of iron, but of course its increased bulk and higher cost operate against any immediate prospects it may have of superseding iron for general use. Aluminum takes a high polish like silver, but, unlike that metal, will stand long exposure to corrosive gases without being tarnished. It can be worked cold and hot, and is in use to day for making surgical instruments, cooking utensils, roofing plate, and a class of like articles. In the year 1891 the United States alone produced 150,000 pounds of aluminum. Its oxide is a common ingredient of soils and clays, such as fire clay, or kaolin, marls, slates, &c. Other forms of the pure oxide of aluminum are to be found in the precious gems, ruby and sapphire, the native crystalline occurrence, and in the less valuable varieties, corundum and emery. In hardness the latter varieties stand next to the diamond. In the metallic state, or as the oxide, aluminum forms the base of a number of useful alloys and salts. Porcelain, earthenware and glass are some of the products in which the oxide is an ingredient. This oxide, or alumina, is the only oxide of aluminum. As such, it is a common constituent of nearly all iron ores, and is hence introduced into the blast furnace, where under certain conditions minute quantities of metallic aluminum are reduced and combine with the alloy of pig iron. The tenacity with which aluminum holds to its combined oxygen makes it exceedingly difficult of reduction, and recourse is had in modern times to the more intense heat and reducing power of the electric current. The exact influence of aluminum upon iron is not yet decided, and its employment to advantage is still the subject of experiment. As far as possible we will treat of the facts in this connection.

Arsenic.—Arsenic is a metal having pronounced peculiarities. It is brittle, of a bright grayish color, and almost as heavy as iron. It will not fuse except under certain conditions, owing to its highly volatile character. Heated to dull redness with exclusion of air, it disappears as a perfectly colorless vapor, which has a penetrating garlic-like odor. In the metallic state this peculiarity serves for its detection, since the smallest quantity burned in the air takes fire with a bluish flame, and while it is thus chiefly converted into the trioxide the heat is sufficient to volatilize some of the metal, which gives off its characteristic smell. It is very readily reduced to the metallic state. The trioxide, arsenious oxide, acid so-called, is a white powder, and in soluble compounds is a dreadful poison. Arsenic occurs in the free state. It occurs combined with sulphur compounds generally, and in this state is associated often with nickel in the ores of iron. Although so highly volatile and having properties opposed to the conditions which would bring it into the hearth of a blast furnace, yet it frequently enters pig iron and in any appreciable quantity is productive of injurious effects. From its association with sulphur, arsenic is sometimes found in fuels. I have taken crystals of arsenic trioxide from the crucible lining in a blast furnace which had used materials in which arsenic was never suspected.

Titanium.—Titanium is a metal strongly resembling tin. While it is a rare metal, its dioxide, called titanic acid, is a frequent impurity in the ores of iron, notably the magnetic ores, and accordingly the metal is usually met with combined in pig iron. In the blast furnace titanium has a tendency to accumulate, and is nearly always to be found in the hearth after blowing out a furnace. It is in the shape of beautiful copper-colored cubes and octahedrons, and is combined in this state with certain other elements. P. W. Shimer has found that titanium exists in pig iron, combined with carbon, and has succeeded in separating the compound in the state of minute symmetrical crystals.

Copper.—Copper is one of the metals of antiquity. The art of tempering or hardening it has been lost, although recovered by the newspapers at stated intervals. Its usefulness in the arts has been the means of making its properties widely known. It is perhaps familiar knowledge that it is compounded into a great variety of alloys, such as brass, bronze, bell metal, &c., all of which are hard and brittle when cooled slowly, but become soft upon being heated and then suddenly chilled. Copper is found as native or free copper, and as such, or combined with other elements, is abundant in nearly all countries. It has a deep red color, is ductile and malleable. For electrical purposes its usefulness is well known. Found in pig iron it may have been derived from any of the materials used in a blast furnace.

Calcium.—Calcium is a light yellowish colored metal. There are several modes of producing it, among which the electric current is employed with success. It is very oxidizable and burns with a bright flame in the air, forming calcium monoxide or lime. Limestone is, therefore, the kind of rock having calcium as a base. Geologically, limestone occurs among the oldest rock formations, and occupies vast areas of the earth's crust. In the great valley of Pennsylvania, along the banks of the Lehigh River, it lies in all possible positions, and covers thousands of acres in an unbroken field. Calcium is also combined in a different state in chalk and gypsum, and is present as a mineral constituent in a majority of formations. Marble is a variety of limestone. When marble or common limestone is heated the carbonic acid with which the calcium is combined is driven off and a white infusible substance called caustic or quicklime remains. This is the calcium monoxide, which combines with water with generation of great heat, forming calcium hydroxide, or slaked lime. Either slaked lime or lime dissolved in water have a strong affinity for carbonic acid, which they absorb rapidly from the air, reproducing calcium carbonate. We utilize this property in mortars and cements, to which they owe the hardening or setting. As lime calcium finds a hundredfold uses. In the blast furnace and cupola it is employed as the vehicle for carrying off undesirable impurities. Lime and silica alone are infusible compounds. United they fuse readily, combining to form various silicates of lime, &c., and in addition to this they open up to the action of the gases the finer particles that would otherwise be deleterious to the final products. Calcium carbonate crystallizes in two distinct forms; the commoner form is named calcite.

Magnesium.—Magnesium is a metal distinguished in its occurrence by being closely related to calcium. Like calcium it has but one oxide, called magnesia, the monoxide. It exists in the crystalline and massive state, as dolomite, analogous to calcite. From the nature of the oxides lime and magnesia, the metals calcium and magnesium may be said to replace each other interchangeably. There are few limestones which are non-crystalline that do not contain magnesia in small quantity. In the metallic state magnesium is silver white, oxidizes but slowly, and fuses at a low red heat. It can be cast, is soft, very light and ductile, though usually it is pressed into wire. In the form of ribbon magnesium can be ignited with a match, and burns with a dazzling light, which is white but very rich in chemically active rays. On this account it is employed as a substitute for sunlight in photography. The magnesium flash light is produced by the combustion of the metal finely powdered. The white substance found on these lamps is the resulting oxide—magnesia. Associated with lime, it finds its way into the blast furnace, but is often specially used as dolomite alone to obtain certain results in fluxing. Both magnesium and calcium are common ingredients of iron ores, more particularly hematites, and although so easily oxidized and extremely hard to reduce are considered by some authorities to become incorporated in pig irons.

We have now come to the more rarely occurring elements, nickel, chromium, tungsten, vanadium and uranium. Suffice it for our present purpose to state that they are all metals, as we have at this point learned to consider such, and although differing radically in chemical and physical aspects they appear to give but one property to iron and steel in the quantities in which they have so far been introduced. We have to deal with them only as they may be present in cast iron, but since their occurrence in nature is in minerals nearly altogether associated with iron ores, we may have future occasion to refer the peculiar behavior of a casting to the indication of one or more of these elements, and we are then prepared to know at least that these metals are accompanied by given effects.

PRIZE COMPETITIONS.

WE HEREBY ANNOUNCE a series of six prize competitions relating to trade matters in which our readers are interested. Four prizes of $50, $25, $15 and $10 will be awarded in each competition.

The competitions are open to all and a general participation on the part of the trade is invited.

We shall have the privilege of publishing any or all of the contributions received.

The committee of award in assigning prizes will take into account the merit of the different contributions and their suitability for publication.

PRIZE COMPETITION No. 6.

How Retailers Can Best Advertise and Extend Their Business.

The object of this competition is to obtain practical suggestions as to the methods which the retail dealer in Hardware, Stoves, Tinware, &c., can advantageously adopt in building up his business, and is intended to cover such points as the following:

Advertising in the local papers, with suggestions as to how such advertising should be done and to what extent;
The manner in which circulars and other printed matter may be used;
A description of any special or unusual methods of attracting and holding trade; and
General suggestions in regard to ways in which the bnsiness can be extended.

An account of any methods which have been found useful in building up trade will be suitable under this competition.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 6.

PRIZE COMPETITION No. 7.

Travelers' Yarns.

The traveling salesman is proverbially happy in the stories which he narrates, and this competition is for the purpose of calling out a collection of good yarns for publication. While the attention of travelers is specially invited to this competition, it is open to all. Stories relating more or less closely to trade or business matters will be preferred.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams 96–102 Reade street, New York, and marked Prize Competition No. 7.

PRIZE COMPETITION No. 8.

How to Treat Clerks.

Under this competition, beside a general discussion of the subject, such questions as the following may be considered:

The extent to which clerks should be given an opportunity of obtaining a knowledge of the business, and of price-lists, prices, &c.;
Whether it is desirable to have formal rules for the regulation of employees and for the management of the store. If so, a set of rules should be submitted;
To what extent clerks should be held responsible for their mistakes;
Suggestions as to how clerks should be treated in order to secure their most intelligent and efficient work;
Mistakes made in the treatment of clerks.

This competition opens an important subject and it is hoped that it will be discussed fully by merchants and by their clerks from their different points of view.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 8.

PRIZE COMPETITION No. 9.

Shop System of Keeping Track of Jobs.

This competition is intended to call out information in regard to methods of keeping account of the cost of labor and material on tin-shop work, repairing and new work, inside and outside. In connection with the general subject such points as the following may be touched upon:

Whether blanks or forms are used in connection with such work. (If so, samples should be submitted);
What record is kept of orders, costs of jobs, charges, &c.;
How time occupied in going to and from the job is covered;
Suggestions in regard to the profitable conduct of the shop.

To illustrate the system it is desirable that a specific job (as for example, repairing down spouting and eave trough, or other job of repairing in which new material is used) be referred to and the method of keeping track of the costs in such job fully explained.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be add ressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 9.

PRIZE COMPETITION No. 10.

Business Maxims—At Least 10.

Those entering this competition will send at least ten maxims relating to the conduct of business, presenting in a brief and pithy manner practical suggestions which may advantageously be followed.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 10.

PRIZE COMPETITION No. 11.

How Small Retailers May Keep a Record of Prices.

The object of this competition is to call out information or suggestions in regard to the best methods to be adopted in keeping a record of prices, showing cost or selling prices, or both cost and selling prices, of Hardware, Stoves, Tinware, &c., in a small retail store employing not more than four persons in the selling and bookkeeping departments, including the proprietors. Those entering the competition are expected to give a concise and clear explanation of their system, and if a price book is used, to submit as illustrating the system at least three specimen pages. If a price book is referred to it may be of any design or arrangement best adapted to the purpose, and may be original with the contributor or may be one of the different price books on the market. Fictitious names should be used instead of the real names of jobbers and manufactnrers.

The committee in awarding prizes will take into account the merit of the different systems described, the character of the descriptions given, and the general utility and interest of the contribution.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business, February 18, 1893.

Contributions should be addressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 11.

Noiseless Store Ladder and Track.

M. Croissant, 202½-204 Washington avenue, Albany, N. Y., is introducing this ladder and track, as shown in the accompanying illustrations. The ladder is shown in working position in Fig. 1, mounted on two 5-inch vulcanized rubber-tired wheels. At the top the sliding hanger or car is

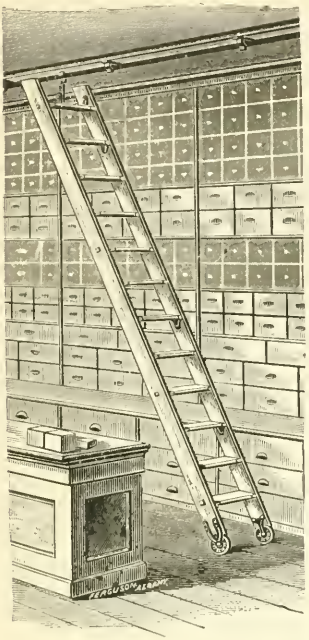

Fig. 1.—Noiseless Store Ladder and Track.

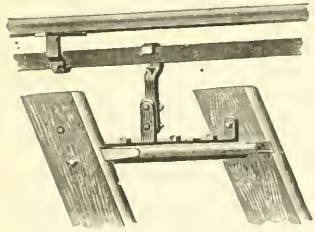

Fig. 2.—Sliding Car and Track.

boxed with hardwood boiled in tallow, to prevent friction and to insure a noiseless movement. The track is of 1¼ x ¼ spring steel set on edge and fastened to neat,

Fig 3.—Wheels and the Manner in which they are Applied.

strong brackets, imparting to the whole a neat and attractive appearance. Enlarged views of the sliding bar and track, also of the wheels, are given in Figs. 2 and 3. The adaptability of this form of hanger to go around curves, as in Fig. 4, on this

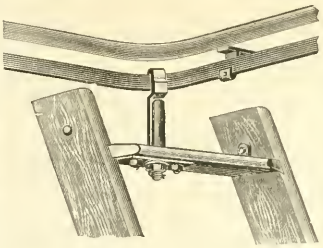

Fig. 4.—Swivel Car and Curve for Turning Corners.

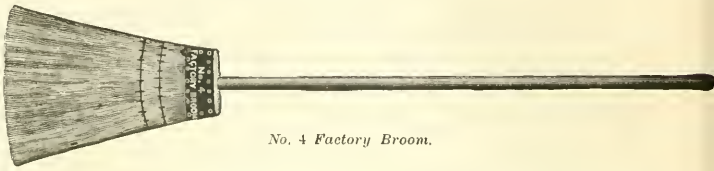
track is an interesting feature and opens up possibilities in store arrangement which have heretofore been impracticable.

No. 4 Factory Broom.

Jos. Lay & Co., Ridgeville, Ind., is offering a rattan mixed broom, as herewith shown. The broom is made of broom corn and rattan mixed together, flat in shape, with an iron band, making, it is claimed, a broom solid, substantial and stiff for handling the heaviest dirt, including in its make up lightness and strength.



No. 4 Factory Broom.

The Champion Adjustable and Reversible Spokeshave.

The Champion Safety Lock Company, 74 Frankfort street, Cleveland, Ohio, are manufacturing this tool, as shown in Figs. 1 and 2. The front view is given in Fig. 1

Fig. 1.—Champion Adjustable and Reversible Spokeshave.

and the back in Fig. 2. The manufacturers explain that the blade can be easily adjusted, that it will cut on a flat surface,

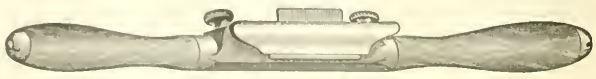


Fig. 2.—Back View of Champion Spokeshave.

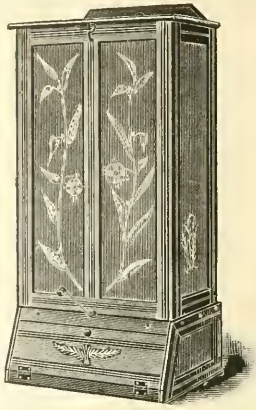
and when it is reversed from one side to the other will cut on a small curve; that it is simple, made of the best material, highly finished, set ready for use, and every one guaranteed to be perfect in every respect.

The enforced idleness of workmen in the building trades during the last two weeks of cold weather, together with the loss of trade sustained by dealers in materials, means that the "snap" has cost a great deal of money.

Cook Flour Bin and Sieve.

Cook Flour Bin Company, Homer, Mich., have recently put this article on the market, as herewith illustrated. It



Cook Flour Bin and Sieve.

consists of a wood cabinet, made to contain 25, 50 or 100 pounds of flour, and finished in walnut, cherry or natural wood. A curved perforated tin sheet forms the sieve and is secured at the top of the base. The upper portion contains the flour, which is introduced by opening a lid at the top of the bin. The door in the base also opens for removing the sifted flour, a tin scoop being provided for this purpose. A large wood screw accompanies the bin for hanging it against the wall. The manufacturers claim that the bin is hung out of the way, that it is made of the best seasoned timber, that it is unnecessary to stoop to reach the flour, that all the flour is well sifted, that all the flour goes through the sieve, and that there are no soldered joints to give out.

The amenities of seafaring life are exemplified in the case of the steamship "Huron," whose owners accepted $60,000 for towing the disabled steamship "Spree" into port instead of double that amount, the sum demanded before going into court. Usually it is a question whether to abandon the property or to accept assistance on the terms offered.

The Emons Wagon Jack.

The Covert Mfg. Company, West Troy, N. Y., have just placed on the market the Emons patent wagon jack, as herewith illustrated, Figs. 1 and 2. The jack, with late improvements, is superior in construction, and cheap as a first-class wagon jack, Its lifting capacity is over 1800 pounds,

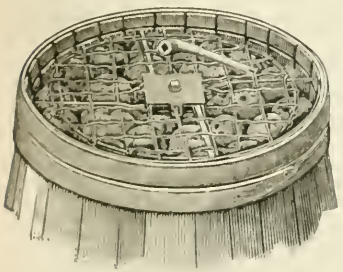
Fig. 1.—The Emons Wagon Jack.

Fig. 2.—Emons Jack Raised.

and all its parts being made of iron it is indestructible. Weighing only 7½ pounds it is easily handled and adjusted, and is a general favorite with those using it. The flat solid base is referred to as a great improvement over jacks having a ring or rim base, as it cannot settle in the ground when in use or tip when lifting a heavy load. These jacks are guaranteed by the makers to give perfect satisfaction.

Phelps Anti-Pilferer.

Phelps Anti-Pilferer, manufactured at Leavenworth, Kan., is being introduced to the trade by Joseph Bogardus, 167 Chambers street, New York, and is shown in the accompanying illustration. It consists of a circular frame of heavy ire, suitable in size to fit the top of a barrel.



Phelps Anti-Pilferer.

In the center of the frame is a cast-iron case or lock, from which radiate four iron rods, pointed at their outer ends. These pointed rods are at right angles to the lock, the latter being provided with a wrench-shaped key. This key fits a hub in the center of the lock; by turning the hub the rods are thrust outward, each about 2 inches, and thus hold the Anti Pilferer at the top of the barrel. The pointed rods cannot be drawn back without the aid of a wrench. The device is designed for use on barrels containing vegetables, nuts, &c., to prevent pilfering by the passers-by. These goods are also made in shape suitable for use on berry crates.

Starrett's Calipers.

L. S. Starrett, Athol, Mass., is putting on the market a line of calipers, as represented in the accompanying cuts. Figs.

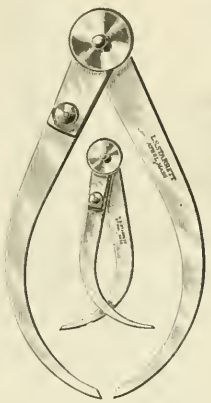


Fig. 1.—No. 38 Lock-Joint Calipers.

1 and 2 show lock joint calipers, which are made in sizes from 4 to 24 inches. In the under side of the short arm is a slot containing a stiff spring. Riveted into the middle leg and projecting through an opening in the arm is a threaded stud, on which is a knurled nut having a beveled hub; this bears against a cone in the arm and the action of the spring holds them together. Turning the nut presses them apart and adjusts the leg while the joint is locked. The spring takes up all back lash, so that the legs are firm. The calipers are referred to as being simple, light, low priced and reliable, of wide scope for both inside and outside work, and can be instantly adjusted to their full extent and as quickly locked firm in the joint and yet provided with a sensitive adjustment. They are made to supersede the old style firm joint, also the lock joint with split leg adjustment formerly made by him. The improvement consists in a socket joint made tapering and locked or released by a partial turn of the knurled disk drawing it together. A spring washer under the disk maintains an easy friction in the joint when unlocked.

The caliper shown in Fig. 3 not only has the excellent features of Nos. 38 and 39, but in addition to common use may be used inside of chambered cavities, over flanges, &c., removed and replaced without losing the size calipered. This is done by loosening the nut binding one arm to the auxiliary leaf and swinging it out or in, while the joint is locked, to clear the obstruction, then moving it back against a stop, where it will show the exact size measured. A lock-joint caliper is also made in form similar to that shown in Fig. 1. The hermaphrodite caliper. Fig. 4, has a lock-joint attachment and sensitive adjustment. It is light and stiff, with large capacity, instantly opened, closed and locked. The points are nicely tempered. This is also made with one sharp point and one curved point, as in Fig. 3.

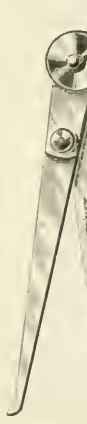

Fig. 2.—No. 39 Lock-Joint Calipers.

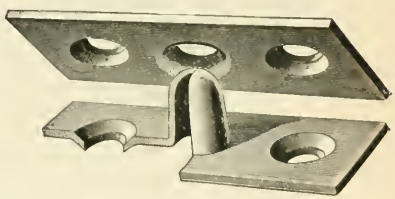
Fig. 3.—No. 37 Lock-Joint Transfer Caliper.

Fig. 4.—No. 43 Hermaphrodite Caliper.

Brass Dowel.

Timmis & Clissold, Bound Brook, N. J., are offering brass dowels, as shown herewith. These are stamped from sufficiently



Brass Dowel.

heavy sheet brass for use by pattern makers, cabinet makers and others. The manufacturers claim that in this way a perfect fitting pin is provided that does not swell with water or shrink from heat, thus insuring ease in molding and true castings, with no overlap; that they save time and expense in the pattern room and foundry, as they are let in quickly; that they do not clog with varnish; that they do not have to be cut to make them work, and that they may be used any number of times, as they are interchangeable and durable. The point is made that because of their peculiar shape they are strong, but not heavy, and that they are inexpensive.

The Gate City Filtering Block.

The accompanying illustrations represent the Gate City natural porous filtering stone, made from the solid rock into a hollow block 5 inches high by 4 inches in diameter, and the uses to which such hollow block is put as a filter. It is manufactured by the Gate City Stone Filter Company, 25 Murray street, New York. Emphasis is laid on the fact that it is made of natural rock and not of artificial stone. The filtering block is shown in Fig. 1, and the attachments and

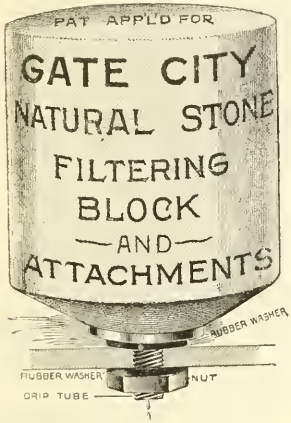


Fig. 1.—The Gate City Filter.

methods of use in Figs. 2, 3 4 and 5. A rubber bushing or ring is cemented into the bottom of the block, and fits watertight on a drip tube fitted into the bottom of a water reservoir. A detailed view of the position of the filter, also of the manner of fastening the rubber bushing and

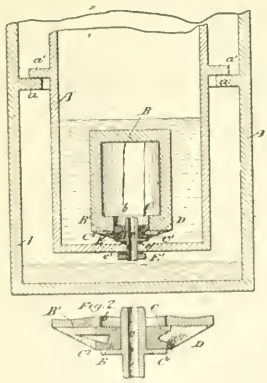

Fig. 2—Detailed View of the Filter.

drip tube into the filter, is given in Fig. 2. As shown in Fig. 3, the water is poured around the filter and passes through the porous sides of the stone block to its interior, and thence down through the drip tube to the receptacle below, leaving on the outside surface of the filter block the foul properties of the water, including, it is claimed, disease germs, decayed vegetable and animal matter, as well as miscellaneous filth found in city and in most spring water. An advantage of this construction is that the filtering block can be easily and quickly removed from the drip tube for cleaning, which the manufacturers advise should be done daily or oftener, according to the condition of the water, as an inspection of the block will determine, by rinsing and brushing the surface of the stone with the brush provided until all the foul accumulations are removed. The point is made that in brushing the block an imperceptible amount of the surface of the stone is removed with the filth. Thus the surface is constantly renewed and the pores opened for continued filtration. It is stated that one of the peculiar properties of the Gate City stone is that all matter is excluded and goes no further than the surface, and that the interior will, after years of use, be found as pure and white as at first. Each block will yield from 4 to 5 gallons of filtered water daily, if kept clean and

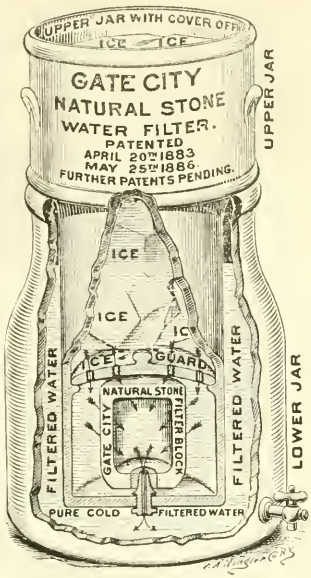

Fig. 3.—Filter and Earthen Jar.

Fig. 4.—Filter in Use.

the jar filled with water to keep up the pressure, but much depends upon the kind of water, if foul, turbid or otherwise. The outside jar, Fig. 3, is made both in porcelain and stone ware, and is also made without the ice guard. In Fig. 4 is shown an arrangement of wooden tubs or pails for those who prefer a less expensive filter. Fig. 5 represents the filter reversed in an ordinary water pail and used in connection with a syphon, and in this way, we are advised, it will filter 4 gallons of water daily. Several blocks can be used at the same time if large quantities of water are required. The Gate City filtering stone has been in use in various forms for the past 12 years, and with a view of introducing the filter more universally the manufacturers have placed it at a price within the reach of all. Thus the filtering block is sold for $2, with attachments as shown, Fig. 1.

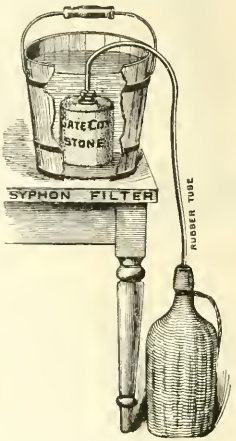

Fig. 5.—As Used with a Syphon.

The company emphasize the importance of having pure water and the efficiency of the Gate City filtering stone in securing it.

The following recipe for coloring brass is contributed by O. Pfeiffer to a recent number of a German exchange: The solution of 1 part of nitrate of copper in 2 parts of ammonia may be used for coloring brass to various shades from light brown to dark black. The brass must be thoroughly cleaned before placing it in the bath in which it must be allowed to remain until the desired color is reached. By burnishing the colored brass with wax a good luster may be produced. Any desired lighter shade may be obtained by dipping the blackened brass into dilute hydrochloric acid, which dissolves the black oxide of copper deposited on the brass. The action of the acid must be gauged by the color desired.

Geo. W. Beck, who is well known to the trade in Pennsylvania, Delaware, Maryland and adjoining territory, has accepted a position with Haslet, Flanagen & Co. of Philadelphia, and will enter upon his duties January 25.

The Wilmot & Hobbs Mfg. Company of Bridgeport, Conn., are the assignees of a patent for a frying pan, recently granted to Samuel R. Wilmot of that place. The lid of the frying pan is controlled entirely by the movement of the ball or handle, the construction being such that the lid may be locked in a raised position by means of the handle only, and when the lid is in this position the pan may be tilted by the handle without touching it with the hand.

TRADE REPORT.

The Iron Market.

The demand for Pig Iron during the past week has not reached the volume desired, and while prices remain unchanged in some sections, at other points they have receded. There is not as pronounced a feeling of buoyancy in the market, and large sales have been effected in some cases by making concessions of some sort. The recent cold weather, which has extended over the past three or four weeks, has largely interfered with business and places the advantages of the market on the side of buyers. Prospects are no less encouraging than they were a week ago, but the business looked for is still in the future. There are certain contracts for large quantities of material which have just been closed, and contracts have been signed to build ships which will require 30,000 to 40,000 tons of material. There are also various projects in view which will require large quantities of material, and structural mills are understood to have already a good deal more work on their books than they have had for years past. These are all encouraging features, providing as they do for consumption of both Raw and Finished Material. As soon as buyers regain confidence in the market and commence to anticipate their wants an improvement in the present condition of affairs will take place. The peculiarity of the situation in the West just now is that sellers appear to be somewhat at sea regarding prices, as competition has developed from unexpected sources, and it is difficult to say how low a level has been reached on some of the largest orders. New York quotations remain unchanged, as follows: Northern brands at $14.75 @ $15.25 for No. 1; $14 @ $14.50 for No. 2, tidewater. Southern Iron, same delivery, $14 75 @ $15 for No. 1; $13.75 @ $14 for No. 2 and No. 1 Soft; $13.25 @ $13.50 for No. 2 Soft.

The Philadelphia market is characterized by spurts of activity and indications of strength followed by dullness and irregularity. Buyers could be found for large blocks of Iron at a slight shading from quoted rates, particularly on the lower grades, but owing to light offerings from the South, prices for this class of Iron are firmer than they have been for some time past. American Scotch Iron is quoted as follows:

American Scotch, No. 1X.....	$17.00	@	$17.25
American Scotch, No. 2X.....	16.00	@	16 25

In Pittsburgh the cause for accepting large orders for Bessemer Pig at shaded prices is a matter of comment upon which opinions differ. It is claimed by some that it was brought about by pressure on the part of furnaces to unload surplus stock, while others claim that the break was made voluntarily by furnaces with the object of influencing prices for this year's supply of ore. It is not unreasonable to suppose that both of the causes noted had considerable to do with bringing about the decline. Only a moderate amount of Foundry is selling on a basis of $14 for No. 1 and $13 for No. 2. Market prices are quoted as follows:

No. 1 Foundry	14.00	@	14.10.	cash
No. 2 Foundry	12.00	@	13.00	"
Charcoal Foundry No. 1....	19.00	@	20.00,	"
Charcoal Foundry No. 2 ..	18.50	@	19.00,	"

Chicago manufacturers have taken the bulk of large orders during the past week, leaving only the trade in small lots for quick delivery to the sellers of Southern Iron. The latter report that a very good demand exists for such quantities, but as soon as they figure on large lots they come in almost hopeless competition with Chicago producers. The sales made last week cover Bessemer Iron as well as Foundry, and quotations are as follows, cash, f.o.b. Chicago:

Local Coke Foundry, No. 1... . ..	$13.75	@	$14.25
Local Coke Foundry, No. 2.....	13.25	@	13.75
Local Coke Foundry, No. 3 ..	13.00	@	13.25
Local Scotch...	14.25	@	14.75

In Southern markets there has been no large buying for forward delivery during the week, but there is some enlargement in the order demand, which more frequently runs to several carloads instead of being restricted to one, and there are inquiries for larger lots which may culimate in a much larger business in the near future. Standard furnaces and Iron companies appear to have confidence in the future, as they are refusing to entertain bids which are not at full prices. For ordinary quantities we quote as follows, for cash, f.o.b. St. Louis:

Southern Coke, No. 1 Foundry,	$14.25	@	$14.50
Southern Coke, No. 2 Foundry,	13.00	@	13.50
Southern Coke, No. 3 Foundry,	12.50	@	12.75

Billets and Rods.—The market has been quiet, although there have been sales of round blocks to a New Jersey Wire mill at slight concessions in price, the seller being an Eastern Pennsylvania works.

Steel Rails.—The market is quiet, no sales of any magnitude having been reported by American mills during the last week. One of the points which are holding back transactions is that the railroads demand terms of payment unusually onerous.

Manufactured Iron and Steel.—The movement is improving, quite a number of contracts having been placed during the week. The impression is gaining ground that the volume of business will be very heavy.

Metal Market.

Copper.—Business has been almost at a standstill during the week under review, and nothing has transpired in the way of new demand or offering calculated to enliven the market. In other words, home trade buying is still extremely conservative, export demand for both fine Copper and Furnace Material drags somewhat wearily, and evidence is not wanting that the "agreement between gentlemen" has thus far failed to bring about desired results, although still looked upon as an effective agency in preventing demoralization of the market. European advices indicate that consumption thus far this year has been somewhat disappointing, there as well as on this side of the Atlantic and that conservative policy on the part of consumers still acts as an offset to the restriction of output here and abroad.

Pig Tin.—The speculative interest has again played the game with which dealers and consumers have become somewhat familiar latterly, moving prices around somewhat here and in London, yet accomplishing nothing that would throw light upon interior workings or motives. The matter of American tariff seems to have lost force as a cue to operations, temporarily at least, and the strongest points in the statistical position are less effective than they were a short time ago. In fact, it looks very much as though the manipulations of the leading foreign speculators still govern prices in a great degree. The movement of stock into the channels of consumption has, to all accounts, been somewhat above the January average thus far.

Pig Lead.—A very few hundred tons will cover the record of sales for the week under review. Demand is slow at the moment and not without evidence that leading consumers are practically a unit in avoiding competitive buying likely to give producers any decided advantage. Latest accounts go to show that the January output at leading points has been moderate, however, and that fact alone serves to keep prices firm.

Spelter.—There is no perceptible improvement in the Eastern demand and offerings from the primary sources of supply indicate that the buying elsewhere is on a moderate scale. Production is going ahead on a liberal scale, and the offering of surplus supplies continues sufficient to keep prices rather weak.

Tin Plate.—Very fair sales have been made of spot goods. In some instances the prices were in line with those that have been quoted for some time past, but concessions have not been purely excep-

tional, and the market is at present looking a trifle weak. Future deliveries have been taken hold of in an indifferent way and prices for these, as well as for prompts, are a trifle easy, although without decided change. In a retail way business is quiet, the extreme cold weather accompanied by snow and ice having put a stop to outside work. The snow and ice, however, are likely to discover weak places in roofs and to be destructive to gutters and spouting, which will result in a good repair business for tinners in the spring, for which they will require Solder and Tin.

Financial.

The transportation of merchandise has been much interrupted by the ice embargo, but bank clearances do not indicate a decline in the aggregate of business transactions, partly due, no doubt, to the recent renewed activity in stock speculation, although clearances outside of New York have surpassed those for the corresponding period last year, which was the largest on record. During the past week, aside from weather conditions, there were no distinctly unfortunate occurrences affecting trade, unless we except the renewed shipments of gold on a large scale, amounting to $4,300,000.

Apropos of the silver question is the annual statement of the production of silver mines in the United States and Mexico, as given in the Wells-Fargo report. According to this authority the mines in the country in 1892 produced in value only $50,607,501, against $60,614,004 in 1891. It is also shown that Mexico produced last year 56,480,000 ounces, or an excess of about $10,000,000 compared with 1891. It is therefore calculated that, altogether, the quantity produced was about 118,950,000 ounces, or not far from 6,000,000 ounces more than in 1891—serving to indicate that the decline in value that has taken place is only in obedience to the law of supply and demand.

The stock market was active and prices touched in several instances the highest point reached for more than a year. The abundance of money is reflected in the weekly statement of the Associated Banks, there being an average gain in cash of $11,192,500. The result of all the changes was a gain in the surplus reserve of $6,919,150, and the banks now hold in excess of legal requirements $22,529,600, against $33,002,900 in the corresponding week a year ago, and $24,089,775 in the preceding year. Loans were expanded over $7,000,000.

In the merchandise markets there is no special change. Cotton declined a fraction, but recovered. Wheat was nearly 2¢ lower, Western receipts continuing large. Exports in three weeks from both coasts have been 9,954,607 bushels, flour included, against 14,026,840 bushels for the same weeks last year. *Bradstreet's* calculates that the quantity remaining in farmers' hands March 1 will be 104,000,000 bushels, and the stock now in sight in this country is 99,631,000 bushels, against 64,085,000 at that date last year.

Chicago Report.

Scrap.—Although a few large consumers have bought a considerable quantity of wrought the past week, there has not been a general revival in the demand and this locality is not in good condition to absorb much of a supply from outside localities. Dealers continue the following nominal schedule of buying prices:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$12.50	....
Machinery Cast	10.00	....
Malleable Cast	8.00	....
Stove Plate (free of burnt)	7.00	....
Burnt Iron and Grate Bars	5.50	....
Sheet Iron and Hoops	4 00	....
Plow Steel and Breaking Stock	8.50	....
No. 2, such as Shovels, Hoes, &c.	4.50	....
Old Boilers—whole (Iron)	8.00	....
" (Iron)—cut in single	....	....
Sheets and Rings	11.50	....
Old Gas-Pipe and Boiler Tubes	9.00	....
Cast Borings	5.00	....
Turnings	7.00	....
Horseshoes	14.00	....
Copper Bottoms	....	8¢
Copper Clips and Heavy	....	9¾¢
Heavy Brass	....	8½¢
Light Brass	....	4 ¢
Pipe Lead	....	3⅜¢
Tea Lead	....	3 ¢
Zinc	....	3 ¢
Rubber	....	2¾¢

Anthracite.—Stocks here are being heavily drawn upon, owing partly to the protracted cold spell and partly to deficiency in the supply of Bituminous, which causes numerous consumers to turn to Anthracite. The conditions seem unusually propitious for an advance in prices, but merchants continue old quotations on carloads of 12 net tons as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
St. Joseph, Mo	9.05	9.30
Leavenworth, Kan	9.05	9.30
Omaha, Neb	9.05	9.30
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.35	8.60
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35

CONDITION OF THE

Hardware Trade.

The week's business shows a marked improvement over that of the preceding one, and it is obvious that trade is beginning to move with more freedom, though it is unquestionably restrained somewhat by the continuance of severe weather. The large houses are actively completing their preparations for the season's trade and getting their stocks in condition for the demands which will soon be made upon them. They are, however, purchasing carefully, there being an increasing disposition to order frequently, letting the manufacturers as far as possible carry the stocks. The prospect for business during the next few months is regarded as excellent. In the matter of prices there is little of importance to note. In some special lines slightly higher quotations are made, but on many staple goods the market is weak and prices are somewhat lower. In this state of things it is obviously the part of wisdom for large purchasers to watch the market closely, as it is likely that some of the staple goods which are exceptionally low may recover strength and somewhat higher prices prevail.

From Chicago we learn that the severity of the weather has seriously interfered with the movements of salesmen, but under the circumstances trade is better than might be expected, although it can hardly be called active. Orders are now being taken for future shipment of Wire Cloth, Poultry Netting, Screen Doors, Refrigerators, Steel Goods, &c., but there is some stocking up in the general line of Hardware by those who found their assortments broken after inventorying. Collections are a little better than they have been, as there is always a great deal of prodding done at the beginning of the year. The improvement, however, is only regarded as temporary, the prospects indicating a tighter money market as the year advances. Country bankers are complaining of the scarcity of funds, caused by the farmers still carrying a large part of their crops which they have been holding for higher prices. This is the most discouraging feature of the present situation. Heavy Hardware jobbers report a moderate volume of business the past week, with competition very keen on any business coming forward in Iron or Steel and consequent weakness in prices.

Notes on Prices.

Cut Nails.—A good many inquiries are being made for quotations on Cut Nails and the volume of business is fair, though not especially heavy. The Eastern mills which have been shut down for a while are beginning to start up, but thus far there has not been any important accumulation of stock. Small lots from store in New York are held at $1.75 to $1.80, figures which are sometimes slightly shaded, and carload lots on dock on a 40-cent average are quoted at $1.60. The question as to the advisability of revising the Nail card is being considered by the manufacturers, and on the 31st inst. a meeting of the representatives of the Eastern and Western mills will be held to discuss the subject and prepare a new card if the way is clear. There are, however, a good many diverse views, and it is not at all certain what the features of the new card will be in case it is decided to adopt one.

Advices from Chicago.—Cut Steel Nails have been in somewhat better demand from factory, and for the time being trade is very steady, with very little pressure to sell by distant makers. Jobbers are selling small lots from stock at $1.65 to $1.70, according to average.

Wire Nails.—Manufacturers have no reason for complaint in regard to the volume of business, the aggregate of sales

being large and inquiries indicating a disposition on the part of merchants to place orders. The margin of profit is, however, exceedingly narrow, if there be any profit at the low prices now ruling. Since our last report the market, instead of gaining strength, has receded slightly, and is characterized by some weakness and irregularity. Small lots from store in New York are quoted at $1.75 to $1.80.

Advices from Chicago.—Manufacturers report a good trade in Wire Nails considering the season, but prices have latterly been demoralized on anything like a good quantity or a choice specification. Manufacturers are endeavoring to check the demoralization. Agents think the chances are good of the manufacturers getting together and controlling prices, and meanwhile do not propose to fill up their order books with low contracts. Small lots from stock are quoted at $1.65 to $1.70.

Barb Wire.—As the season advances there is more inquiry and some increase in the volume of business. Small lots from store in New York are held at $3.10 for Four-Point Galvanized, with 10 cents off for carloads.

Advices from Chicago.—Only a moderate business is reported by manufacturers. Jobbers are taking control of the trade at this time, as they are selling at $2.15 and $2.60, with 5 cents advance for small lots. The Joliet Enterprise Company's stock of Barb Wire was to be sold to the highest bidder this week, but so far no particulars have been made public as to the transaction. Whoever gets it will have a cheap lot of Painted Wire to put on the market.

Lawn Mowers.—The Lawn Mower market is active, with a prospect of a large aggregate of business during the season. This is a line of goods for which there is a constantly increasing demand, and in the production of which a number of new manufacturers are engaged. The result is very active competition and comparatively low prices on many of the machines. While the leading makers who have an established reputation are holding their trade there is a large demand for cheap Mowers, on which a wide range of prices prevails.

Nuts.—Hot pressed Nuts are somewhat lower than they have been, as the weakness which has heretofore existed has been succeeded by slightly reduced quotations. The market is in an unsettled condition.

Rivets and Burrs.—The market for Iron Rivets and Burrs continues in a demoralized condition. Prices are low and irregular and do not as yet show indications of increased strength. A further weakness in this line has developed in a week or two

Cordage.—The Rope market continues without important change since our last review, there being a fair amount of business notwithstanding the fact that buyers are not generally placing orders to cover their future requirements. We are authorized by Travers Bros. Company to contradict the report that there have been recent negotiations looking toward the purchase of their Cordage interests by the National Cordage Company, a report which they state is without foundation. A similar contradiction is made in regard to John Good's Cordage interests.

Faucets.—The following revised quotations on the extensive line of Faucets manufactured by John Sommer's Son, Newark, N. J., will be of interest as representing the present prices:

	Per cent.
Peerless Best Block, Tin Key	40
IXL, first quality, Cork Lined	50
Diamond Lock Faucets	40
Perfection Fla. Red Cedar, in boxes	40
No Brand Red Cedar, in barrels	50&20
Reliable, Cork Lined	60
O. K. Western Pattern, Cork Lined	50
Western Pattern, Metal Key	40
Boss, Metal Key	50
No Brand, Metal Key	60

Cross-Cut Saws.—An effort is being made by some of the leading manufacturers of Cross-Cut Saws to discontinue the quotation and sale of these goods by the foot and to sell them by the piece. Lists are accordingly issued giving the prices on each size of Saw, as shown in the following revised list of Cross-Cuts issued by Henry Disston & Sons, Philadelphia. This list is subject to the regular discount of 40 per cent.:

	4ft.	4½ft.	5ft.	5½ft.	6ft.	6½ft.	7ft.	7½ft.	8ft.	
Great American Tooth	$2.56	2.88	3.20	3.52	3.84	4.16	4.48	4.80	5.12	each.
Lumbermen Tooth	2.56	2.88	3.20	3.52	3.84	4.16	4.48	4.80	5.12	"

Triumph Narrow without handles:										
Champion Tooth	1.44	1.62	1.80	1.98	2.16	2.34	2.52	2.70	2.88	"
Diamond or Great American Tooth	1.52	1.71	1.90	2.09	2.28	2.47	2.66	2.85	3.04	"
Humboldt, California, Toledo Blade and Sabine	4.00	4.50	5.00	5.50	6.00	6.50	7.00	7.50	8.00	"

Whips.—As relating to a line of goods handled by many in the trade, the quotations given below will be of interest. They represent some of the leading goods of the American Whip Company, Westfield, Mass., and 54 Warren street, New York:

IXL Whalebone Driving Whips:

4½	5	5½	6	6½	7	7½	8	feet.
$18	$20	$22	$24	$27	$30	$33	$36	per doz.

Eureka, Two-third Whalebone Whips:

5½	6	6½	7	feet.
$15	$16.50	$18	$20	per dozen.

Bull Bone, Half-length Whalebone Whips:

5½	6	6½	7	feet.
$11	$12	$13	$15	per dozen.

American Standard, Half-length Whalebone Whips:

4½	5	5½	6	6½	7	7½	8	feet.
$8	$8.50	$9.50	$10	$10.50	$12	$13.50	$15	$16.50 per doz

True Grip, Raw Hide Center Whips:

4½	5	5½	6	6½	7	feet.
$6	$6	$6.50	$7	$7.50	$9	per dozen.

New Name, Stocked Java Whips:
Black and wine colors, 6 feet, $6 per dozen.

Americans, '93 Pen Whip. A unique penholder with each Whip:
6 feet..... $6 per dozen.

Gents' Light Driving:
No. 111—6 feet..... $6 per dozen.
No. 106—6 feet..... $5 per dozen.

No. 103. Hand-made Stocked Java, black and wine colors:

5½	6	feet
$3.75	$4	per dozen.

The company also make a large variety of cheaper grades which sell from 50 cents to $3 per dozen; Team Whips, ranging from $2 to $7.50 per dozen, and Toy Whips, from $2.50 to $12 per gross. Their assortment also includes Whips, gold mounted, with ivory handles; Coach, Tandem and Tally-ho Whips, and Ladies' and Gentlemen's Riding Whips. The company are making a specialty of their new Hardware assortment, 10/American, which is composed of 75 Whips carefully selected, intended to retail at $75. It includes one Sign Whip, worth $5; 100 Rules with dealer's name on, and 100 Folders for distribution to customers, for which no charge is made. The price of this assortment to the trade is $50.

Indurated Fiber Ware.—Cordley & Hayes, 173 and 175 Duane street, New York, issue under date January 25 a list of Indurated Fiber Ware which supersedes all previous lists. They also call attention to a reduction in their Star Pails, which are now listed at $4.20 per dozen, which is subject to the regular discount of 25 per cent., f.o b. New York, cash 30 days, less 2 per cent. for cash in 10 days. On an order for not less than $100 list, all to be shipped at one time in one lot, delivery will be made at any railroad station east of the Mississippi River. They also allude to the fact that low prices are named on other articles.

Planes.—We are advised by H. Chapin's Son, Pine Meadow, Conn., that he has withdrawn the portion of his discount sheet recently issued relating to Planes, and the following revised quotations are announced, terms 30 days or 2 per cent. discount for cash in ten days:

	Discount, Per cent.
Bench Planes, Common Pearce	50
" " Extra and Premium	45
" " With English Irons instead of American	30
Ship Planes	45
Miscellaneous Planes	40
Bench Planes, Apple, Box and Rosewood	20
Carriage-Makers' Tools	20
Molding Planes	40
Grooving Plows	40

Freezers.—There is little to report this season in regard to Freezers, the line of goods put on the market by the different manufacturers being substantially the same as last year, with slight modifications and improvements suggested by experience. The competition between the manufacturers continues very active, but prices are

not materially lower than they have been, and they are referred to as leaving the manufacturers a narrow margin of profit. There is a general anticipation of an active demand during the season, partly in view of the bountiful supply of ice which is assured throughout the country, and partly in view of the fact that stocks in dealers' hands are probably lighter than for several years, so that both jobbers and retailers will enter the market with practically no old stocks carried over. In addition to this the natural increase owing to the general prosperity of the country and the constant extension in the demand for Freezers will tend to make the business large.

Enterprise Mfg. Company.—The following changes in list prices are announced, under date January 17, by Enterprise Mfg. Company, Philadelphia:

No.	Per dozen.
75, Sad Irons, either Nos. 1, 2 or 3	$4.75
76, " " "	5.00
87, Polishing Irons	6.25
77, "	5.00
105, Toy Irons	4.25
	Each.
55½, Family Outfit of Sad Irons	$3.50
1, Sad-Iron Heater	1.35
2, " "	1.85
630, Bone, Shell and Corn Mill	7.5
1, Coffee Mill	2.25
2, "	3.50
2½, "	4.50
209, "	25.00
210, "	30.00
212, "	35.00
214, "	40.00
16, "	40.00
216, "	50.00
218, "	55.00
62, Power Meat Chopper	225.00
35, Sausage Stuffer	6.50
Barrel Jack, Truck and Stand	6.00

Under date January 18, they announce the following discounts applying to their catalogue of 1892:

	Per cent.
Lawn Mowers, Lawn Mower Parts, Sad Irons, Sad Iron Handles	40
Cherry Stoners, Fruit, Wine and Jelly Presses, Hand Power Meat Choppers, Ice Shredders	30
Lawn Sprinklers, Sausage Stuffers, Sausage Stuffing Attachments, Shoe Stands and Lasts, Barrel Jacks, Beef Shavers, Bone, Shell and Corn Mills, Bung-Hole Borers, Cheese Knives, Coffee Mills, Flag Holders	25
Fruit Augers, Measuring Faucets, Molasses Gates, Power Meat Choppers, Tincture Presses, Tobacco Cutters, Barn Door Bolts, Bullfrog Door Weights, Cork Pressers, Cork Pullers	20
Mole Traps, Sad Iron Heaters, Vegetable Slicers	15
Parts, excepting Lawn Mower and Sad Iron Handles	20

Perfect Lawn Rake.—F. E. Kohler & Co., Canton, Ohio, are selling the Perfect Lawn Rake, a description of which appeared in our last issue, at the following prices:

No.	Per dozen.
1, 22-inch wide, 28 teeth and hood	$4.50
2, 22 " " 28 " without hood	3.75
3, 18 " " 22 " and hood	4.00
4, 18 " " 22 " without hood	3.50

Glass.—During the past week there have been no further developments in completion of arrangements by the National Glass Company. Demand for window Glass is still limited and American factories are doubtless accumulating stock. The market as a rule is firm, but there is noticed a disposition on the part of some manufacturers to move stock by making slight concession in prices for large lots. The outlook for the coming season is considered bright, and it is believed that present prices will be strictly adhered to, if not advanced, when spring trade opens. Business with jobbers is quiet, though prices are fairly well maintained. American Plate Glass is being quoted from Pittsburgh by D. E. Wheeler, agent, at 60 and 2½ per cent. discount to the retail trade. Jobbers are making open prices of 60 and 5 per cent. discount, and close buyers, it is understood, can buy at from 60 and 7½ per cent. discount to 60 and 10 per cent. discount. French Window Glass is not very firm at 75 and 10 and 5 per cent discount, though there is a disposition on the part of some importers to advance prices slightly in the near future. Future prices of American and Imported Window Glass will depend largely upon the demand. Present quotations on Glass are as follows: American Window Glass, 1000-box lots or more, 80 and 15 per cent. discount; carloads, 80 and 10 per cent. discount; less than carloads, 80 and 5 per cent. discount. French Window Glass, 75 and 10 and 5 per cent. discount. American Plate ranges in price from 60 and 2½ per cent. discount to 60 and 5. Imported Plate Glass, 60 per cent. discount to 60 and 10 and 5 per cent. discount.

Old Rubber.—The following are the current prices paid for Old Rubber delivered in New York:

Trade Notes.

HENRY ADLER, 322 and 324 West Forty-first street, New York, favors us with a neat little catalogue of Stove and Adjustable Sheet Metal Elbows, Stove Pipe, Leader Pipe, Eave Troughs, Ventilators, Chimney Caps, Leader Pipe Hooks, Gutter Braces, Charcoal Furnaces, &c., which he manufactures. The pamphlet consists of 16 pages, bound in colored paper covers. It is profusely illustrated and contains, in addition to descriptive particulars, price-lists of the goods shown.

A FOLDER furnished by the Anthony Wayne Mfg. Company, Fort Wayne, Ind., gives some details respecting the line of Washing Machines manufactured by that concern. The figures presented show a very gratifying increase in the sales of these Machines since the year 1887. In that year 5507 were sold, and in each subsequent period of 12 months the numbers sold have increased at a rapid rate. During 1891 the sales totaled 26,842, which number had increased to 39,973 in 1892. The company inform us that they have booked orders for over 41,000 Washers for the present year, and anticipate an output of at least 50,000. They have increased their facilities largely, and have placed several new machines in their factory, which enable them to turn out 200 Washers daily with the same help that it took to make 150 formerly. The Washing Machines manufactured are No. 1 Anthony Wayne Washer, with loose crate, which lifts out of the tub; No. 2 Anthony Wayne Washer, a cheaper machine with corrugated stave and bottom, and the New Western Star Washer.

WE LEARN from the Toledo Machine & Tool Company, Toledo, Ohio, that the year past has been a very prosperous one for them and the outlook for the coming season is very encouraging. During the past few weeks the company have been running their entire force on extra time to keep up with the demands for their presses and other sheet metal machines, of which they are building a large line.

BALTIMORE CHEMICAL COMPANY, Gough and Seventh streets, Baltimore, Md., call attention, in a ten page pamphlet, to the Perfection Soldering Flux made by them. The Flux is stated to be free from all the objections that apply to muriatic acid. It is put up in concentrated liquid form, and must be diluted with about two parts of water to one of Flux before using. The advantages claimed for this preparation are that it is better and cheaper than rosin or acid, costing about 1 cent per pound; that it is free from the poisonous fumes of acid, and will not injure the health of workmen using it; also that, containing no acid, it does not discolor the tin. It is specially recommended for canners' use. Samples are sent free by mail.

MERCHANT & Co., Philadelphia, Pa., have issued this year a calendar that in many ways surpasses their previous New Year greetings. It is a card some 12 x 16 inches in size, beautifully decorated in colors and bronzes. The calendar proper is very plain, tacked to the lower part of the card, while near it are illustrations of the Star Ventilator, Tiling and boxes of Roofing Plate. The text is brief, giving the name of the company and the offices in Philadelphia, Chicago, New York and London, with the legend "Guaranteed American Roofing Plates." The feature of the decoration is the French scroll

work across the top and down the side encircling the representation of an ancient war galley with the basket of fire at the bow and masthead. Nearby, in the middle of the sheet, is a modern cruiser with a search light thrown on another ship of war, showing the contrast between the methods of illuminating in the warships of the ancient Greeks and the modern Americans. The general background is blue and purple, with green water below, and the decorations near the scrolling are of several colored bronzes. Altogether it is a very artistic production.

THE MICA MFG. COMPANY, 89 Fulton street, New York, are busy on orders for Mica used for electrical purposes. This company make a specialty of colored Mica, such as is employed in connection with heating Stoves, Mica Fire Screens, &c. John O'Neil, president, has been identified with the Mica business for something over 25 years

THE NEW YORK ELBOW COMPANY of 18 Cliff street, New York, report a good demand for their line of specialties, including Elbows and the Empire Roaster and Baker. The sales for the past season are said to have been more than double those of a year ago. Their Roaster is made in four sizes of Russia iron, the arrangement being such as to give satisfactory results in operation.

AMONG OUR SPECIAL NOTICES this week is one relating to a vacancy in a Western stove company of the position of vice-president and general manager. The particulars of the business opportunity are given in the advertisement.

IN HIS HALF-PAGE ADVERTISEMENT appearing elsewhere in this issue, John Hamilton, Pittsburgh, Pa., manufacturer of Hamilton's Best Re-dipped American Roofing Plate, announces to the trade the names of the firms from whom his goods can be procured in Buffalo, N. Y.; New Haven, Conn.; Hartford, Conn.; Syracuse, N. Y.; Cleveland, Ohio; Detroit, Mich., and Davenport, Iowa.

THE RUTLAND FIRE CLAY COMPANY, Rutland, Vt., are distributing to the trade a number of colored picture cards advertising the Rutland Improved Stove Lining which they manufacture. This material is said to be made from the very best fire-resisting substance, and the lining is claimed to fit any stove.

THE ANNUAL MEETING for the election of officers of the Youngstown Stamping Company of Youngstown, Ohio, will be held on Thursday, February 9 next.

AMONG recently authorized corporations in Illinois are the following: The James Steam Cook Stove Company at Chicago; capital stock, $150,000; for the manufacture of stoves and kitchen utensils; incorporators, Will. S. James, W. W. Watron and C. S. Neelos. The Fleming Radiator Refrigerator Company at Chicago; capital stock, $100,000; for the manufacture of refrigerating apparatus; incorporators, Mathew D. Watson, George Fleming and H. M. Boreman. The Hammond Light & Power Company at Chicago; capital stock, $50,000; to furnish light, heat and power; incorporators, Marcus M. Towle, Alonzo Stephens and Frank J. Baker. Mount Carmel Light & Water Company at Mount Carmel; capital stock, $50,000; for furnishing electric light, heat, power and water; incorporators, William S. Teed, John B. Ried and Joseph H. Reynolds. The Durand Hardware Company at Durand, Winnebago County; capital stock, $10,000; for retailing merchandise; incorporators, C. A. Norton, Frank Shelk and J. N. Geary. The Johnson Giant Grip Vise Company, Chicago; capital stock, $20,000; incorporators, William Johnson, J. Charles Moore and Edward S. Curtis. The Standard Knife Works, Chicago, capital stock, $20,000; incorporators, William George F. Griffith, Randall W. Burns and George W. Underwood. The Green & Terry Harrow Company at Chicago; capital stock, $50,000; for the manufacture of agricultural implements; incorporators, W. W. Green, Francis E. Terry and Josiah Cratty. The Chicago-Topeka Light, Heat & Power Company at Chicago; capital stock, $1,200,000; to furnish light, heat and power to be produced by fire, steam, electricity, compressed air and water; incorporators, William Bruce, John G. Campbell and Cornelius V. Smith.

THE BURN STAMPING & MFG. COMPANY, manufacturers of Dairy Supplies, Lanterns and other specialties, have just completed their new factory at Chicago Ridge, a suburb of Chicago. Their main office and salesrooms are located at 66 Lake street, Chicago. W. P. Ketcham is president, John T. Dale vice-president, W. S. Burn general manager and superintendent, W. H. Burn secretary and J. R. W. Munce treasurer. Their Lantern catalogue is in course of preparation and will shortly be issued.

TAEGE BROTHERS, Arlington Heights, Ill., have just issued a catalogue of Creamery and Dairy Supplies manufactured by them. Illustrations, descriptions and prices are given of Cream Vats, Cheese Vats, Factory Weigh Cans, Factory Cans, Cream Coolers, Separator Heating Vats, Shioping Cans, Peddling Cans, Measuring Pails, Setting Cans, Dippers, Measures, Churns, Butter Workers, &c. The catalogue comprises 48 pages, beautifully printed, handsomely illustrated, and bound in a neat paper cover.

THE CHICAGO OFFICE of the Kankakee Mfg. Company has been removed to 266-268 Wabash avenue. Lakin C. Taylor, secretary and treasurer of the company, is the manager of the branch office. The company's factory is at Kankakee, Ill., where they have recently added to their line of refrigerators the manufacture of regular sideboards in great variety, and also pillar extension tables.

THE BUSINESS heretofore conducted under the firm name of Wm. Ellemund, at Sioux City, Iowa, will hereafter be continued on a larger scale by the Sioux City Steam Plumbing & Mill Supply Company, of which C. H. C. Moller is president, C. F. Rock is manager and E. P. Alford mechanical engineer.

THE LIGHTNING ICE CREAM FREEZERS, manufactured by Shepard Hardware Company, Buffalo, N. Y., will be made this year with inside parts coated with pure Block Tin, and will be supplied with their new Automatic Scraper, which was first brought out in 1892.

IN AN illustrated work devoted to the business and manufacturing interests of Syracuse, N. Y., is given a view of the works of E. C. Stearns & Co. The plant covers an area of about 3½ acres, upon which are a four-story factory 60 x 253 feet; foundry 150 x 242 feet; wood-working department 60 x 92 feet; screen frame factory 60 x 104 feet; japanning building 40 x 50 feet; pattern store house, dry lumber store house, painting department and a number of other buildings. Reference is made to their line of bicycles, which have been further perfected for 1893.

JACOB BROMBACHER'S SONS, of 30 Cliff street, New York, announce that they are now in a position to do cutting off of iron and steel in rounds and squares up to 4½ inches in diameter, and of other shapes up to 4½ x 6 inches. They are also in a position to do annealing of the most even kind for die blocks, &c., up to 24 x 14 x 8 inches.

THE YOUNGSTOWN STAMPING COMPANY, Youngstown, Ohio, call attention to the Friend Glass Oil Can, by an illustration of the Can on a card, inclosed in a neat case. The Can is referred to as one of the best, and the statement made that they also manufacture several other styles and grades. An accompanying circular illustrates their Blue Band Oil Can, made in 1, 2, 3 and 5 gallon sizes.

REFERRING TO THE CIRCULAR issued by Lalance & Grosjean Mfg. Company and St. Louis Stamping Company in regard to Onyx Ware, Hermann Aich, 43 Murray street, New York, has issued a circular under date January 16, in which he states that all Onyx Ware now being handled by him is sold in infringement of their rights by one either under assignment of these parties or otherwise. Mr. Aich adds that he carries a full line of Onyx and Blue and White Ware, and also the well-known fancy Marble Tea and Coffee Pots, with nickel trimmings. Of all these goods Mr. Aich advises us that he has a large stock.

BRITISH AGENCY: The Ironmonger, 42 Cannon St., London, England.

The Index of *The Metal Worker*, Volume XXXVIII, July-December, 1892, is now ready, and may be obtained on application to David Williams, publisher, 96–102 Reade street, New York; or to 220 South Fourth street, Philadelphia; Room 509, Hamilton Building, Pittsburgh; 59 Dearborn street, Chicago; Fourth and Main streets, Cincinnati; Bank of Commerce Building, St Louis; 146 Franklin street, Boston, and 219 Superior street, Cleveland.

Pipes in Buildings.

In a building recently inspected, every pipe, whether for steam, water or gas, was entirely uncovered, and every part of every pipe was accessible for examination or repair without disturbing a wall, floor or ceiling. The pipes did not look badly either; nor were they apparently at all in the way of furnishing, or calculated to interfere with any of the purposes for which the building was erected—namely, for stores in basement and in first floor and offices in the stories above. The treatment of these pipes in finishing them had entered into the general design of decoration, and the effect, though perhaps a little odd at first, like that of a new style of hat, was really quite good when one got a little used to it. There appears to be a growing tendency, at least in buildings erected for business purposes, to render pipes more accessible from the interior of the structure than was formerly the practice, and there are several very good reasons for adopting this method. A pipe may spring a leak. If in plain view the leak is likely to be discovered before any very serious damage results, whereas, if concealed, water may be discharged in quantity sufficient to do considerable mischief before it is known that a leak has occurred. Long channels formed in brickwork in which riser pipes are placed and then covered over, form flues through which foul gases, if any escape in the cellar, rise at once to permeate all parts of the building. If the pipes be cold, as for conveying water or gas, this action may be slow, being effected by diffusion only, but if steam pipes are placed in such channels an immediate circulation upward is set up, the heated air rising and escaping through spaces around radiator connections, &c., and this action constantly carries up any escaping gases from the cellar with the utmost neatness and dispatch. Pipes have hitherto been hidden, for the most part, because they are unsightly things, but if it be really better from a sanitary or an economic point of view that they should be exposed, architects must grapple with the problem of making them tolerable to refined taste, as has been done with gas fixtures and electric lighting appliances.

Heating Greenhouses.

No observing person who has traveled much in this country during the past 10 or 15 years can have failed to note the rapid increase in the number of greenhouses. He might very naturally attribute this to improvement of the general financial condition of the country and the accumulation of wealth that enables more people to gratify their individual tastes than was possible in the earlier history of our country, and, doubtless, this is one cause. But another more potent influence upon the erection of such structures is that they have been found very profitable when applied to the cultivation of plants, fruits and vegetables for market. The old saying that "money makes the mare go" applies to the business of building and heating greenhouses, the large majority of which are wealth accumulators, instead of simply means for spending surplus funds. The growing of grapes under glass has become a large and profitable industry. Tomatoes in considerable quantities raised in greenhouses begin to reach the New York market in midwinter, and sell here at prices per pound that could not be obtained for half a bushel of them raised in the open air in summer and marketed in autumn. The same holds good for rare flowers and early vegetables. The large prices paid are not always merely fancy prices. Some fruits and vegetables are improved by growing them in this manner, as notably tomatoes, which acquire a peculiarly fine flavor by this treatment. It has been well recognized by those who build and heat greenhouses, as well as those who carry them on for business purposes, that their profits have been rendered possible by improved systems of heating, wherein portable, automatically regulating heaters, carrying sufficient fuel to maintain their action during any interval of time likely to be required, maintain a uniform temperature; and also by improvements in the construction of buildings themselves, notably consisting in the use of lighter framing, larger glass, and lower, flatter roofs than were formerly in vogue. Specialists have given the subject great attention, and there are now architects who confine themselves almost wholly to this branch of building. The more extended employment of steam for heating greenhouses, due to the supply of boilers with ample fuel-carrying capacity and automatic regulation, has possibilities now that did not exist 20 years ago; and the use of small wrought iron piping has much cheapened the cost of heating apparatus for this use.

Patents in Great Britain.

The record of applications for patents in Great Britain and Ireland during the year 1892 shows that the progress of invention in that country, noted annually since 1883, still continues. The number of applications in the past year was 24,166, a total much exceeding that of any previous year, and greater by 1278 than that of 1891. This constant advance shows a remarkably healthy enterprise among British inventors. In commenting on these figures the London *Times* makes the following remarks: "It is evident that inventive energy is in no danger of decay, and there is no indication that a maximum in the number of a year's applications has been reached." The chief event of 1892, in connection with patent work in England, was the reduction granted by the Board of Trade in the sums payable for renewal of patents. This gave material relief to many patentees, and still left to the Patent Office a handsome surplus of receipts over expenditure, amounting to over $500,000. In noting the above totals we should be curious to know how far the increase may be due to applications from American inventors. This must be a very material factor nowadays, when so many of our patentees register their inventions in Great Britain and other foreign countries.

American Inventors.

In turning to the figures presented by our own Patent Office for the year 1891—the latest for which we have a report—we find that the condition of invention in the United States compares very advantageously, as regards the number of applications for patents, with that of Great Britain. The number of applications recorded for the year in question was 40,552, or more than 60 per cent. larger than the British total for the later year. This is only what might be expected. Conditions and circumstances in this country are much more favorable to the inventor than is the case in the older and calmer atmosphere of Europe. Invention and adaptation are among the leading characteristics of the average American, the striving after better methods in manufacture, labor-saving devices, and every means which shall add to the comfort of every-day life and to the celerity of business. He is un-

trammeled by precedent, and generally possesses a nimbler brain than his fellows in the old world, although perhaps he may, with some notable exceptions, be somewhat lacking in the patient research and plodding application which lead to great discoveries. The limitless scope possessed by Americans in the region of invention, and the results already achieved, are, however, fully appreciated across the water. "An American invention" has become the household word for anything novel or ingenious, whether it be really so or not. The term has an irresistible attraction for the European mind, and people the world over are beginning to look upon the United States as the natural home and stronghold of inventive genius. From the Patent Office reports it would appear that American inventors are determined to hold the pre-eminence which they long since achieved.

The Panama Canal Failure.

The daily press has lately devoted much space in its foreign news columns to the affairs of the ill fated Panama Canal and those connected with it. An investigation into the disposal of funds intrusted to the company which promoted the work has been followed by the arrest and imprisonment of the directors and others interested in the enterprise—including several world-renowned names—and their arraignment on criminal charges. Facts have been unearthed by the Committee of Inquiry charged with this duty, which throw light on a wholesale system of bribery and corruption, and a scandalous waste of treasure which accompanied the entire proceedings from first to last. The revelations made and the voluntary confession of one or two of the principal actors necessitated the dismissal of a number of members of the French Government, who are said to have been implicated in or cognizant of the crooked methods of the company. Numbers of members of the French Senate and Chamber of Deputies are accused of receiving bribes and will be tried for that offense. In fine, France—and, indirectly, all Europe—has been stirred to its depths. The failure of the gigantic undertaking of the great engineer, to whom the world owes the Suez Canal, has brought ruin and misery upon tens of thousands of French homes—for the money was mainly procured in that country. Funds to meet the heavy expenses of the work were raised by every conceivable means, including a great lottery scheme. Shares in the enterprise were subscribed for mainly by the middle classes and the less wealthy portion of the French people. Thrifty agriculturists, small traders and petty capitalists invested the savings of years—often literally hoarded in a stocking—in what they believed to be a certain method of fortune making.

Disposal of the Funds.

The money was fooled away in the purchase of costly machinery of all kinds, most of which is now lying rusty and useless on the Isthmus of Panama—squandered in ridiculously expensive contracts, paid out in bribes and commissions, and expended on labor which was never performed. Thousands of lives were wasted, and after eight years of work the company found themselves with barely half the work accomplished and their coffers drained empty. Some $300,000,000 had been expended between 1881 and 1889, when operations were suspended; and it was calculated that as much again, or more, would be required to carry the canal to completion. This there was no possibility of obtaining, and now all the treasure and loss of life has gone for nothing. For four years the works have been idle, machinery and material spoiling in the moist, hot climate of the Isthmus, and much of the work that was accomplished is being undone by nature. The canal was planned to be 46½ miles long, straight across the Isthmus of Panama, having a depth of 25 feet and a width, at the surface of the water, of 124 feet. The plan necessitated the construction of eight immense locks to obviate the difficulty of a higher sea-level on the Pacific side. It is difficult to see how this factor could have been overlooked—as it was overlooked—by the engineers charged with the task of prospecting. This failure on their part involved entire change of plans and a consequent heavy expense. The whole tale is one of foolish carelessness of consequences and want of proper caution and control on the part of M. de Lesseps, and of gross mismanagement, corruption and duplicity on the part of the other managers of the enterprise which is not pleasant to contemplate.

Flue-Devils.

No, it is not a mistake of the printer; it is *flue*-devils, not *blue*-devils, that have prompted this present writing. Surely of them it may be said, quoting from Poe:

> They are neither man nor woman,
> They are neither brute nor human;
> They are ghouls—

those beings who go about the earth and through apparent malice aforethought throw fiendish obstacles in the way of the contractor for the erection of heating apparatus. For really it stretches charity to its limit of elasticity to attribute some things found in the construction of flues to ignorance. Yet some say it is want of knowledge which underlies the construction of chimney flues, of ventilating flues, of warm air ducts, &c., that so frequently bring the heating engineer to the verge of insanity, not to say profanity; the first being a misfortune which, if peculiar to business of a harassing kind, ought to be prevalent in the heating trade; the second being a vice which only the inherent virtue of stovemen and the heating fraternity generally could hold in check under the vexations and exasperations that beset them. Could it be ignorance, or was it not rather malignity that constructed a chimney flue 16 x 16 inches at the top, and for 10 or 12 feet from the bottom contracted it to a 4 x 16 inch flue? Yet this was actually done. Is it want of sense or want of conscience that leads an architect to provide a couple of 8 x 8 inch flues for a building that needs 2800 square feet of low pressure steam radiating surface to warm it in zero weather? Yet this was done and the building, a handsome structure, was erected to the pinnacle, and great was the disappointment of the owners thereof when decorated walls and floors and ceilings had to be mutilated to supply what they had guaranteed to furnish the heating contractor—good and efficient chimney flues. Their architect had assured them the flues were sufficient and he stuck to the assertion, though no honest man in the heating trade could be found who would confirm it. Why, even the colored boy blacking stoves on the second floor back of the shop knew those flues were not large enough. Could it be want of brains, want of thought, or want of an immortal soul that led another architect, when a chimney flue of 196 inches area was required, to cunningly make this flue 6 x 36 inches so that it would not interfere with some features of his design (save the mark, unless his design was to make all the trouble he could to those who employed him, and all others employed upon the structure)? Yes, this was done; it almost staggers belief, but it's a cold fact all the same. We could tell, also, of other misconstructions that would seem incredible to intelligent men who have not had their faith yet shattered all to bits by experience in the heating business; but this will do for one dose. Some time, when the reader gets to feeling too confident in his bright future as a heating engineer, and is feeding his self-esteem a little too fat over a successful job, thinking that after such a piece of work he never need fear any more trouble, another potion of the same sort of emetic may be good to administer for his health.

Shop Stories.

IN THE POETRY LINE.

Our kids felt so highly elated over their enlarged week's earnings last Saturday night, they decided to go and hear Bill Nye. The effect on Frank and Bill is almost startling. Apparently they think everything should serve some good purpose, and after listening to Bill Nye's famous poetry, "Autumn Leaves," and believing it worthy of imitation, have handed in the following sample of winter poetry. Here it is *verbatim spell-at-im*:

THE PLUMBER.

A la Bill Nye.

Tune, "Autumn Leaves."

The water pipes is freezin',
Freezin' mighty tight;
Freezin' in the day time,
Also after night.

The water pipes is bustin'
Bustin' all around,
Bustin' in the kitchen,
Also underground.

The plumber he is happy,
Happy all the day,
Mending pipes by candle light,
Also the other way.

The cook is happy too,
Happy now for aye;
The water back, it busted,
And she has gone to stay.

Bill thinks the last verse should read:

The cook is happy now,
Happy, too, forever more;
The water back exploding,
Blew her out the door.

Mr. Editor, do you think there is anything seriously the matter with either of these boys?

SWIPED JOINT.

COPPERSMITHING.

ART OF COPPERSMITHING.

XXXIX.*

BREWING COPPERS OR KETTLES.

Large brewing coppers are made in several different ways; the accompanying illustrations give three of the styles most per proper to hold 50 and the light course to hold 50 barrels also. The coppers may be made in any proportions to suit the place they are to occupy; that is, they can be tall or squat, as the room can be spared, because the copper, in consequence of its bulk, together with the brick work necessary for the furnace, takes up considerable room, and therefore is usually the dimensions required for the sides and bottom. Then the top diameter of a 106-gallon kettle measures 38 inches, and $\sqrt[3]{38} = 54{,}872$ inches, and as a barrel (English) contains 36 gallons, therefore 50 barrels contain 1800 gallons, and $1800 \div 106 = 16.981$, or the number of times 106 gallons is contained in 50 barrels. We now

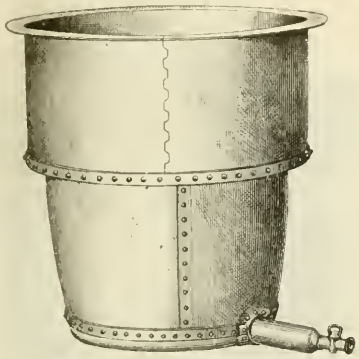

Fig. 444.—Open Copper, with Light Course.

Fig. 445.—Sketch Illustrating Shape of Coppers.

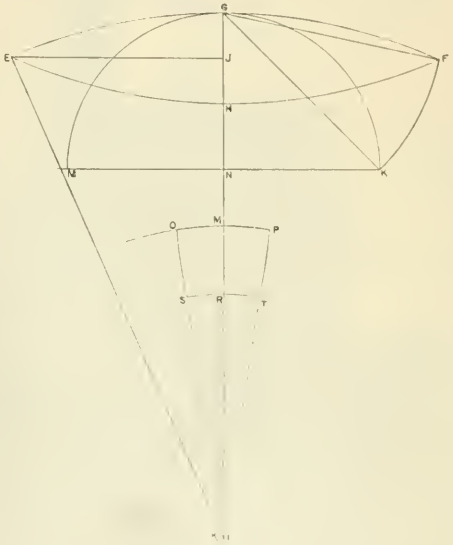

Fig. 446.—Diagram Used in Calculating Patterns.

Fig. 447.—Hollowing Tub.

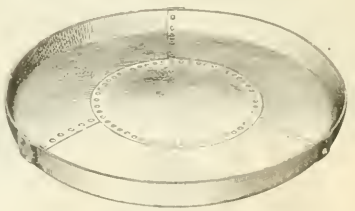

Fig. 448.—Four-Piece Bottom.

in use, and will, I think, be sufficient for our purpose.

Fig. 444 is an open copper with a light course; that is, an addition to the copper proper, to enlarge its capacity and lessen the cost, the light course being made of lighter material than the copper proper, and yet of sufficient strength, as it is usually supported by brick work built around the course nearly or up to the brim. Let us build one of these large coppers with a light course, and let it hold, say, 50 barrels in each course; that is, the copplaced in some convenient position, as much out of the way as possible.

In an early chapter it was shown that the usual proportion for a copper to hold 106 gallons is, top 38, bottom 33½ and depth 28, so we will make our proposed 50 barrel kettle in the same proportion, and then add the light course to it. Now all vessels of capacity are in the triplicate ratio; that is, comprise length, breadth and thickness, or their capacity is found by multiplying these three dimensions together.

Therefore we will take the diameter at the top as the basis by which to obtain multiply the cube of 38, or 54,872, by 16.981, the number of times 1800 gallons contain 106 gallons, which gives us 930,781.432, and then extracting the cube root of this last result we get 97.63, or the top diameter of a copper to hold 50 barrels, which, in practice, we should call 8 feet 2 inches. Here then we have the first dimension of our proposed copper, 8 feet 2 inches. We will now proceed to obtain the other two dimensions by proportion, thus: Taking the dimensions of our 106-gallon vessel, as stated, top 38, bottom 33.5, and depth 28 inches; then 38 : 33.5 :: 97.63 : 86. Again, 38 : 28 :: 97.63 : 71.938. From

* Copyrighted, 1889, by John Fuller, Sr.

this, then, we find the three dimensions of a 50-barrel copper to be: Top, 97.63; bottom, 86.068, and depth, 71.938, which we should call 8 feet 2 inches top, 7 feet 2 inches bottom and 6 feet deep. We must now have the pattern for the sides, which we will proceed to get. By referring to Fig. 445, it will be seen that a copper is a part of the middle zone of a circular spindle; that is to say, the body of which it is a part is generated by the revolution of the segment of a circle, and up of a number of pieces, as in the case of large coppers. Then as stated: The depth of the copper is one-half the chord of the arc AB, and is 71.938 inches, and the versed sine of the arc AB is one-half the difference between the diameter of the top and bottom, which is $\frac{11.57}{2}$ or 5.785.

$$\frac{71.938^2}{5.785} + 5.785 = 450.176,$$

the radius E I, 203.611, or E J, which is one-half the length of the spindle, and

$$\sqrt[2]{851.538 \times 48.815 + 48.815^2}$$

$= 209.586$, or G F.

But G F = G K, therefore

$$\frac{\sqrt[2]{851.538 \times 48.815 + 48.815^2}}{2}$$

$= 144.91$, or K N the radius the inside

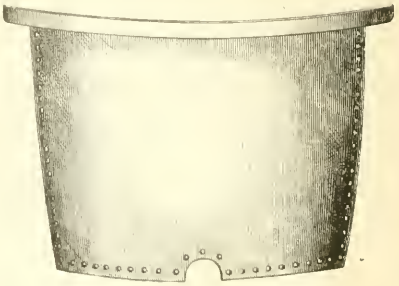

Fig. 454.—Side Ready for Riveting.

ART OF COPPERSMITHING.

the versed sine of the segment is one-half the diameter of the copper at the brim. Without a knowledge of the properties of the circular spindle, we can at best only make a good guess at what the pattern should be.

The illustration here given shows two coppers with their brims placed together, and then the outline of the spindle completed. This when carefully and intelligently performed gives the key for cutting the sides of all bellied vessels which are built

Fig. 446, of the circle of which the curve of the spindle (that is, the sides of the coppers from top to bottom, or from A to B) E A B F is a part. The diameter G H at the center of the spindle is 97.63; then one-half G H, or $\frac{97.63}{2} = 48.815$ or the versed sine G J of the arc E G F, Fig. 446, and $450.176 \times 2 - 48.815 = 851.538$; then $\sqrt[2]{851.538 \times 48.815} =$

M G K; whence K M is 144.91×2, or 289.82; that is, 24.15 feet is the radius of the curve at the brim edge of the pattern, and $289.82 - 71.93 = 217.89$, or 18.157 feet, is the radius for the arc S T at the bottom edge. Again: $\frac{97.63 \times 3.1416}{6}$ $= 51.1424$, or the versed sine of the arc of the circle of which curve the side edges must be cut before hollowing in the hollowing tub, Fig. 447, ready for placing in position for riveting—that is, when the

$\frac{2}{203.611}$ sides are in three pieces. Then $\frac{}{51.1424} +$ 51.1424 = 812.78, or the diameter in inches of the circle of which the curve of the two edges are a part or must be cut before hollowing.

Therefore $\frac{812.78}{2} = 406.39$, or 33.8658 feet, for the radius of the two side edges of the pattern. Here, then, we have three pieces or sides in the small sketch, Fig. 446, 102.2383 from O to P, 71.93 from M to R, and 90.059 from S to T, with a radius of 33.8658 feet for the curve of the side seam edges, and a radius of 24.15 feet for the curve at brim, and 18.157 the radius of the curve at the bottom.

These dimensions are, of course, all bare —that is, nothing allowed for the seams or the brim which must be left on to suit the rivets which are to be used in the side seams and the width of the brim required for the light course, a part of which would be taken from the depth, as the side would not reach the lag of the bottom by some 2 or 3 inches, for which allowance must also be made. We now come to the bottom. To-day they may be had already milled up in one piece at any size or strength up to 15 feet in diameter. But when I was a boy there was no machinery then in existence of such capacity; hence it was necessary to make large bottoms by hand in four, five and sometimes more pieces, Figs. 448 and 449. But we will suppose that we have the bottom supplied to us in one piece, and let it be 7 inches deep. Now, the first thing is to put the bottom in shape for planishing—that is, form the crown, as shown in Fig. 450, by hollowing in the hollowing tub. This hollowing tub, Fig. 447, as we call it, is a wooden ring like a washtub without a bottom, made of oak staves about 2½ inches thick, about 2 feet high and from 3 to 4 feet in diameter, taper, and supported by three stout hoops, which are bolted to their places after the wood has shrunk sufficiently. The bottom is laid over the tub bottom side up, Fig. 451, and two men with large mauls or hammers sink the bottom in the tub, while another man guides the bottom on the tub with the iron dog D, shown in Fig. 452. When the bottom fits the template it is turned the right side up and the planishing is begun, which is done as shown in Fig. 452. A suitable large head is placed in a block and the bottom is then smeared all over on the outside with wet plumbago, also the surface of the block on which the bottom rests, so that the bottom will slide about with ease while the planishing is going on. The inside is rubbed all over with either wet or dry Spanish brown, so that the blows may be plainly seen. When the planishing has been completed, the bottom is placed on two or more suitable trestles, Fig. 453, and after marking the holes the proper distance apart, the rivet holes are punched in the bottom with a punch placed in a chisel rod and the hammer *b*, while a man holds a bolster *a* on the outside (the bolster *a* explains itself). Then all three sides, which have been previously prepared—that is, bellied or hollowed and planished, Fig. 454—are placed in position and secured with bolts. Then the head is taken out of the block and put into a sling *d*, Fig. 453, and one man holds the head in position inside while two others, opposite each other outside, work in the rivets, first with long handled cross-peined hammers *c*, and finishing with hammer *b*. The light course is now prepared, the sides of which may be brazed or riveted together, as desired, when, after planishing, the holes are punched in the bottom edge, and then the course is set in its place on the copper brim and the rivet holes punched through the riveting edge into a small bolster and the rivets worked in with short-handle hand hammers. The pipe or outlet is next worked in and all finished up complete.

The same methods which are here described may be used for building a vessel of any number of pieces in the side or of any shape. In Fig. 455 is shown a large open copper, with a light course, completed ready for use, and about to be set in its future resting place. This vessel was built in 1891 by Messrs. Shears & Co. of Bank-side, London, and is said to be the largest copper ever built in England. It has a capacity of 36,000 English gallons. This large vessel was built for Ind, Coope & Co. The reader can get an excellent idea of its construction, as well as its immense size. The size of the rivets should be noticed, the proportion of the copper proper to the light course, and then the three iron bands placed around the light course to strengthen it. This is a very interesting and instructive illustration for those engaged in this kind of work.

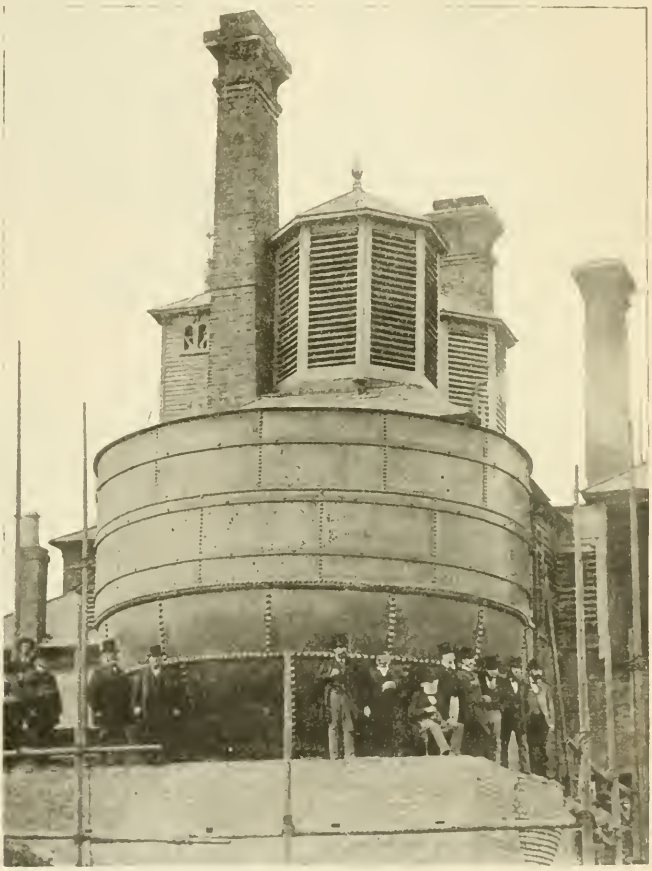

Fig. 455.—Large Open Copper with Light Course.

ART OF COPPERSMITHING.

It is not disputed that New York is a growing city. In the building line there were upward of 100 plans filed at the Building Department each of which involved an expenditure of $100,000 or over; there were three where the expenditure was $700,000, and in 14 instances the amount was not less than $300,000. Lofty dwellings and flats were a leading feature. The total cost of new buildings projected in 1892 was $59,000,000 as compared with $56,000,000 the year before, and the number of buildings was nearly 3000, a moderate increase over 1891. Among structures completed the Havemeyer building, fifteen stories high, is the giant. Among those who have engaged suites for terms of years in the latter are the Consolidated Wire Works Company, the National Tube Works Company, the Delamater Iron Works and the Westinghouse Air Brake Company.

The foreign trade of the United Kingdom in 1892 shows very unfavorable changes when placed in comparison with the figures for the previous year. The imports of merchandise show a decrease of $57,420,325. In the exports of British goods there is also a very large decrease, amounting to $98,181,277, but the re-exports of foreign goods display an increase of $12,671,324. In the total values handled there is a reduction of no less than $142,930,078. The excess of imports of merchandise has risen to $644,478,061, an increase of $28,089,428.

THE LETTER BOX.

Lengths of Wrought-Iron Pipe.

From A. J. J, *Trout Creek, N. Y.*—I wish to ask if it is possible to have wrought iron gas or water pipe made of a standard length? As it is now, in having different lengths, a great deal of extra work is made for one that retails pipe.

Answer.—From the needs of manufacture, wrought-iron pipe is not made in exact lengths. A margin of from 12 to 18 inches is usually given to a rolling mill on which to work the skelp. Should an exact length be desired, the loss on account of crop ends and scrap would considerably increase the cost of the pipe. Moreover, consumers prefer random lengths, as being more convenient for general purposes. Sometimes a buyer wants 120 feet of pipe, and at another he may wish for only 18 or 16 feet, and is better pleased if he can obtain a length that practically meets his requirements. We are informed, too, by one of the largest concerns manufacturing this material that in various sections of the country different lengths are preferred. Throughout the Middle, Western and Southern States, for instance, purchasers take as long lengths as possible in order to avoid a multiplicity of connections, while the Eastern trade, who are obliged to handle their pipe on trucks in the narrow streets of the cities, refuse to receive it beyond a certain length. Consequently, no arbitrary standard has ever been adopted, although manufacturers are always ready to furnish pipe in exact lengths at an advance of about 5 per cent. on the price of random lengths in order to cover the loss in scrap. The lengths which obtain in the various kinds of wrought iron pipe are: For butt weld, which includes the smaller sizes, from ⅛ inch up to 1¼ inches, 13 to 16 feet, and lap weld, from 1½ inches upward, 18 to 20 feet, although special furnaces can turn out the latter variety as long as 26 feet.

Pin-Holed Copper.

From T. F. M, *Coteau Landing, Quebec, Canada.*—I send you a piece of pin-holed copper which I took off a drainer that had been used to catch drippings under a beer pump for about five years.

Note.—In *The Metal Worker* of April 16, 1892, we printed some remarks on the question of pin holes in copper, in reply to two correspondents who had written to us on the subject; but no conclusion was reachable in the matter at that time, nor has any adequate explanation of the phenomenon been received since then.

The piece of metal forwarded by our correspondent is a circular disc of 14 or 16 ounces copper, 5½ inches in diameter, containing five ¼-inch holes, for drainage, in the center. The whole of the under side, except the small space surrounded by the drainage holes, is more or less pitted, and perforated in about 40 places with pin holes, varying in size from ¼ inch to a mere speck. A general corrosion of the surface would, in this case, be naturally attributable—especially after five years' use—to the action of the beer. But this would not satisfactorily account for the manner in which this specimen has been become pin-holed.

As we pointed out in our former notes, one theory which has been advanced to account for the appearance of pin holes, is that in rolling the copper it was not kept perfectly clean, and small specks of oxide got into the surface, which became eventually centers of corrosion on being acted upon by acids or gases existing in the liquid or air with which the metal comes in contact. This is the most plausible explanation in the present case. Another theory was that acid was left on the sheet before tinning; but this reason will not apply here, as the perforations occur on an untinned surface.

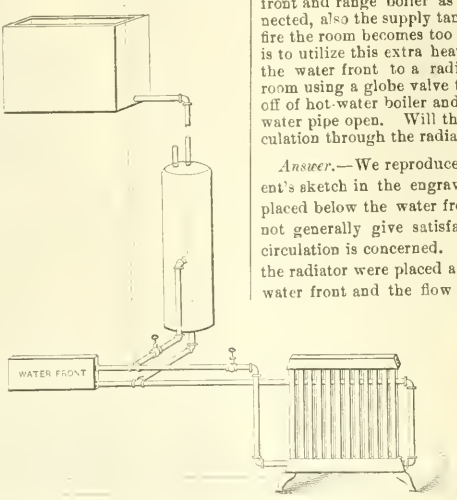
Material for Gutter.

From E. F. B., *Greenville, Pa.*—I saw in *The Metal Worker* of January 7 a request from "W. D. M." for the best method for lining gutters. Having used all the materials now made except aluminum, 35 years' experience has convinced me that a good quality of IX bright tin, locked together and well soldered with strictly half and half solder, is the best. There should be three coats of paint on the underside of the tin, and the tin should be put in without any buckles and laid with good drainage. The front of the gutter should be fastened with nails and an edge turned on the back and held on flat cleats. The seam should be flattened down to allow for expansion and the gutter given three coats of good paint.

Radiator Below Water Front.

From S. H. J., *Sumner, Iowa.*—I wish to ask through the columns of *The Metal Worker* if the proposed plan, as shown in the inclosed drawing, would prove a success. The drawing represents the water front and range boiler as I have it connected, also the supply tank. With heavy fire the room becomes too warm. My idea is to utilize this extra heat by connecting the water front to a radiator in another room using a globe valve to shut the water off of hot-water boiler and leave the cold water pipe open. Will this give me circulation through the radiator?

Answer.—We reproduce our correspondent's sketch in the engraving. Radiators placed below the water front as shown do not generally give satisfaction so far as circulation is concerned. If the bottom of the radiator were placed above the top of water front and the flow and return pipe between back and radiator connected up without traps, satisfactory circulation will be attained. The valves may be placed as shown by our correspondent, but care should be taken not to leave the two valves shut at the same time, because such an occurrence would cause steam and water to be blown into the supply tank or steam might be produced in water front to the extent of allowing it to become overheated.



Radiator Below Water Front.

A Word for the Hot-Air Furnace.

From W. F., *Pennsylvania.*—There is no subject that needs to be brought before the people more constantly than ventilation, and it is marvelous that so little attention is given to it. It seems to me that every effort should be used to educate the public in this direction. In my opinion the furnace is a much-abused article. If properly put up and of greater capacity than is ordinarily needed, so as to insure a surface moderately heated, together with an abundant supply of outside air through

a clean channel and the house in which it is placed properly ventilated, I believe it will give results as near perfection as possible. Of course these same ends may be reached by indirect water or steam heating, but I think a furnace, especially for private dwellings, is the best.

Note.—It is not very often that any of our readers furnish us their ideas on the relative merits of the different systems of heating. There is a great deal to be said in favor of the hot-air furnace, and we wish that other of its advocates would send us their ideas. At the same time, if any of the adherents of steam and hot-water boilers are radically opposed to the furnace principle we would like to have their reasons. In other words, a discussion of the relative merits of the different systems of heating would be both interesting and instructive.

Painting Conductor Pipe.

From I. F. G., *Lebanon, Pa* —In reply to the communication of "G. R. C.," Mansfield, Pa., on painting conductor pipe, that appeared in *The Metal Worker* January 21, I will describe the plan I have followed the past few years. I paint one side of the sheets before cutting, using the painted side for the inside. To a gallon of raw linseed oil (never use boiled oil) I add ½ pint each of the best japan dryer and turpentine, mixing with the finest brown metallic paint dry, and paint the sheet very carefully. After the paint is thoroughly dry I make up the pipe; and the only objection I find to this way of painting (and which I would like to overcome) is the fact that where the joint is soldered together the paint is partially burnt off.

From J. H., *Richmond, Ohio.*—In *The Metal Worker* of January 21 "G. R. C.," Mansfield, Pa., wants the experience of tinners as to the best way of painting conductor spouting on the inside. His method is to tie a cloth on the end of a wire to swab out the pipe. I found a sponge on the end of a suitable handle or stick better than the rag process; but the trouble was to keep the sponge in order when not in use. I then found that this way was better —namely, to pour paint into the conductor pipe at one end with a small vessel, and to have a larger vessel at the other end to catch any paint that might run out. Bring the conductor to a level and then run it around until the paint covers all the inside. Then elevate the conductor and let the paint run back into the can.

A Movement in Shopkeepers.

From D. Ust, *Dryden, Tenn.*—The novelty of *The Metal Worker* in a fine new rig will make any tinker stare, and while scanning the eyecatchers I hit on friend "M. U. D.'s" account of stock in the January 14 number and read it, then laid down the paper and quietly whistled and thought; read it again and took a stroll among my old settlers. After the stroll, which showed similar assets, I read it again and wondered how in the fire "M. U. D." got on to my case so well, for I hadn't seen any one around since the snow. Then, as I had journeyed rather widely before starting a shop, I concluded that "M. U. D." had hit pretty much all over and many another fellow as hard as himself and me. I noted he wasn't making any resolutions, but his invitation to call later was a lively hint that if the rest of us wanted to be in the hunt we had better raise the dust. Right there I took another tour of inspection and found a heap of repairs—grates, bricks, &c.—that had accumulated and a lot of old stoves that were in pretty bad shape. Well, an idea struck me there that in this cold weather many people would want a stove if it could be had cheap enough and right away. So I called my jour and two boys and said, "You see that pile of old grates and bricks, and that pile of old stoves." They took it, and I told them that I wanted every one of the stoves rigged up some way so a fire could be run in it before Saturday, and that if anybody wanted anything done that would interfere they were to be put off and told that we were getting ready for a big bargain sale in stoves, and to spread that news everywhere; and I wanted them to do a good job of hustling and make them look first rate. Our paper comes out on Thursday, and I went to see the printer and found him shivering with a little stove, and told him I would give him a stove that would make it hot for him if he would do some advertising for me, and he jumped at the bait, and I told him I wanted some posters and a big space in his newspaper with this in it:

A NEW WRINKLE IN OLD STOVES.

NO TRASH. CHEAP FOR CASH.

NEXT SATURDAY.

SELL THEY MUST.

D. UST,
DRYDEN.

I swopped another stove with the painter, to put the same on a big banner like the campaign banners, and hung it across the street. Then I dusted and cleaned up the store, made it look as if a new man had come to town, and had everything looking first class, fresh, new and clean, and made room for the old settlers to be shown up to their best advantage, and early Saturday morning had the sidewalk in front of my store, my show windows and the front of the store full of them, all with big placards with the price in big figures and a lot of suggestions like "Give the stock a warm feed," "First rate for a wash-day stove," "You work better when you are warm," "Bakes a beautiful brown," "You can heat water on the top," "Apples can be dried with this stove," "Just the thing for heating sad irons," "Grocer, don't let things freeze in your cellar," "This won't kill things in the hot house." Well, that Saturday nearly killed us all. We sold all the stoves we had ready, and some that were not, and heaps of tinware, stove pipe, took orders for roofs, spouts, gutters, heater work, repairs, and were hustled every way; and now that I've got into it I'm going to keep having some sort of a scheme every month this year, and if they go I'll report the result for the benefit of the other fellows, the same as "M. U. D." did, for it's due to his report that I scooped in a good many dollars in cash, had some bills paid, and have a lot of orders ahead.

Cement for Glass and Metal.

From G. A., *Akron, Pa.*—Can you give me a receipt to cement glass in kettles and tanks for dairy use that gets harder quicker and is better than linseed-oil putty, which I have been employing?

Answer.—The following recipe may be of use to our correspondent: Take finely powdered litharge, fine white dry sand with plaster of paris, each three parts by measure; finely pulverized rosin, one part. Mix thoroughly and make into a paste with boiled linseed oil to which dryer has been added. Beat the mixture well, and let it stand four or five hours before using. After standing 15 hours it loses its strength. This cement, it is said, when well made of good materials, will unite glass and iron so firmly that the iron will often split rather than part from the cement. It is said to be good for either fresh or salt water, and has been used with great success.

Trouble with Gas Range.

From W. M. A., *Watertown, Mass.*—I am much interested in your explanation of the trouble experienced by "G. R.," Mansfield, Pa., with his gas range causing moisture to gather, which was noted in *The Metal Worker* of January 28. I have experienced exactly the same trouble, except that it has been caused by an oil-heating stove and occurred in two different instances. The same theory could hardly hold good, I should suppose, and would like an explanation.

Note.—We do not wonder that our correspondent questions our explanation as being applicable to the case of the oil heater. Nevertheless, we think that it is not altogether unreasonable. The oil in burning will likewise give off water, though we should think to a much less degree than the natural gas. Wherever hydrogen is present in the fuel and burns, moisture is the result. We do not know just what the proportion of moisture would be from burning oil, but in an unventilated room, with the products of combustion emptying into the room itself, it is not unlikely that such a result would follow. The remedy in this case is the same as in that of the gas range. We should advise in this and in every case where combustion takes place that a pipe be carried to the chimney or in some way out of doors. In a living room, where there is lots of ventilation, the doors being constantly opened and perhaps air coming in through a register, and in which the occupants do not stay for many hours together, there is not so much need of ventilation and the carrying off of these gases. In a sleeping room, however, the stove should be connected with a flue. We consider it a most fortunate thing that these stoves do produce dampness in unventilated rooms, for the discomfort of having damp walls will lead to a remedy where the occupants might not be aware of the vitiated air.

Statistics of the coal trade published in Philadelphia show a wonderful increase in the production of anthracite and bituminous coal in this country of late years. Here is a summary:

	Short tons—	
	Anthracite.	Bituminous.
1880	28,043,812	42,831,758
1890	45,600,487	95,629,026
1891	49,500,000	100,000,000
1892	52,000,000	110,000,000

Representative Harter of Ohio has offered a bill which provides that in case any monopoly or trust exists, contrary to the public interest, and it is found by the Secretary of the Treasury upon investigation that such monopoly or combination to maintain artificial prices is aided by any duty imposed upon foreign imports, or by any patent granted by the United States, it shall be within the power of the Secretary to abolish such a duty on imports or such a patent.

THE TIN SHOP.

Triangulation in Pattern Cutting.—XIX.

By Triangle.

PATTERN FOR THE FRUSTUM OF A PYRAMID DIAMOND SHAPE IN PLAN.

In Fig. 143 is shown in perspective the article for which the pattern is to be constructed. In Fig. 144, let B C D E represent the side elevation, H K M N the corresponding plan of base, and P R S T the plan of top. N″ T″ R″ K″ is the end elevation, under and in line with which is drawn the corresponding plan, in which the miter lines are shown by N′ T′, H′ P′, R′ K′ and S′ M′. In the side elevation B C gives the length from H in the base to P in the top, and in the end elevation N″ T″ is the distance from N′ in the base to T′ in the top. We will describe the pattern for one of the sides by the aid of these distances. Place the T-square at right angles to N M in plan and drop line indefinitely from the points N T S M, as shown. At a convenient distance from N M, and parallel with it, draw the line *n m*, cutting the lines drawn at right angles to N M, as shown. With *m* of pattern as center, and B C or D E of elevation as radius, describe an arc cutting the line S *s*. With *n* of pattern as center, and N″ T″ or R″ K″ of end elevation as radius, describe another arc, cutting the line T *t*. Lines drawn through the points thus obtained will form the pattern for one side, as shown by *n t s m*. Another way of describing the pattern would be by constructing a triangle that would show the slant hight of the article. To do this, draw any line, as G′ F′, in length equal to the straight hight of the article, as shown by G F or M″ S″ of elevations. At right angles to F′ G′ set off G′ J, equal to the distance between the base and top in plan, as shown by L J. By connecting J F′ we have the distance from the point L in the base to J in the top. At right angles to *n m* of pattern set off the distance J F′, equal to J F′ of triangle, and draw *t s* parallel with *n m*, cutting the point F′ and the lines T *t* S *s*.

The straight hight of the article being known, the pattern could be described from the plan and a diagram of triangles, the base lines of which can be found or drawn on the plan, their altitudes being the straight hight of the article and their hypotenuses giving the distances from points in the base to points in the top as if measured on the finished article. To construct this diagram of triangles, draw the right angle M G F in Fig. 145, making G F equal to the straight hight of the article. From G set off the lengths of the solid or miter lines in plan necessary for describing the pattern. The letters under the line M G indicate the corresponding line in plan, as N T-G is the length of N T of plan, as is M S-G the length of S M in plan. By connecting the points in M G with the apex F we have the length or distance from points in the base of article to points in the top. In Fig. 146 is shown a duplicate of the plan, upon which are drawn the triangles in Fig. 145. To describe the pattern it will be necessary to obtain the distance from N in base to S in top. In the diagram we set off from G the distance N S of plan and connect N S-F. On the plan we draw N S, as shown, and draw S *s*′ at right angles to N S, in length equal to the straight hight of the article, and connect N *s*′, as shown. The triangle M R *r* of plan, or G M R F of diagram, is constructed in a similar manner.

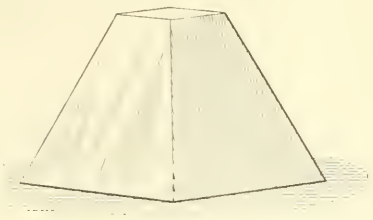


Fig. 143.—View of Finished Article.

Fig. 145.—Diagram of Triangles whose Bases Represent the Miter and Diagonal Lines in Plan.

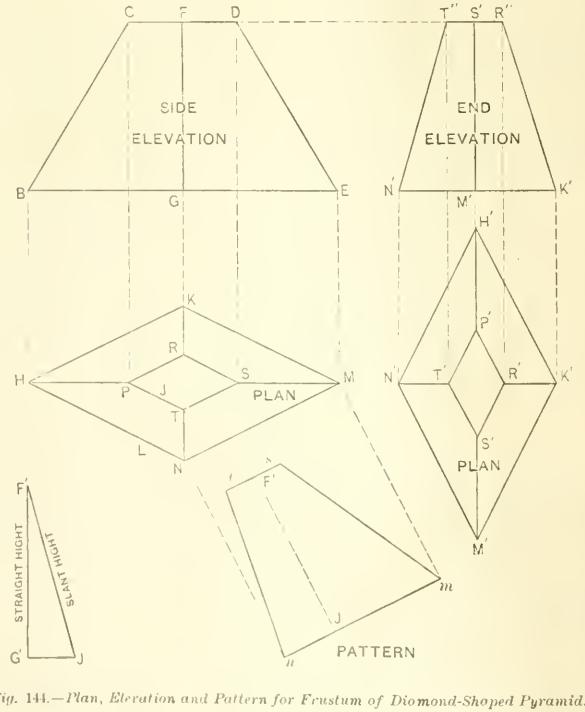

Fig. 144.—Plan, Elevation and Pattern for Frustum of Diomond-Shoped Pyramid.

PATTERN FOR FRUSTUM OF PYRAMID DIAMOND SHAPE IN PLAN.

For the pattern shown in Fig. 147, the triangles in the diagram or those on plan can be used, as may be desired. The object in showing a variety of methods for describing the same pattern is to allow the reader to determine which is the best adapted to his requirements. For the pattern shown in Fig. 147 proceed as follows: Draw the line N″ *t*″, in length equal to the hypotenuse N *t* of plan, or N T F of diagram. With *t*″ as center, and T S of plan as radius, describe an arc, *s*″, which intersect with one struck from N″ of pattern as center, and N *s*′ of plan as radius, thus establishing the point *s*″ of pattern. With N″ of pattern as center, and N M of plan as radius, describe an arc, M″, which intersect with one struck from *s*″ as center, and M *s* of plan or M S-F of diagram as radius, thus establishing the

point M″ of pattern. Lines traced through the points thus obtained will give the pattern for one of the sides, and similar to the one in Fig. 144. The pattern for the next side can be obtained in a similar manner; or, with S″ of pattern as center, and S R of plan as radius, describe an arc, r°, which intersect with one struck from M″ as center, and radius M r of plan, which establishes the point r° of pattern. The point K° represents the distances M K of plan and N t of triangle or N T-F of diagram. H K r° p° of pattern can be obtained in a similar manner if desired. Lines drawn through these points will give the desired pattern, as shown by K° M″ N″ H″ K″ r p' t'' s' r°. A model similar to the view in Fig. 143 can be made by forming a duplicate of the pattern in the required shape. For a model

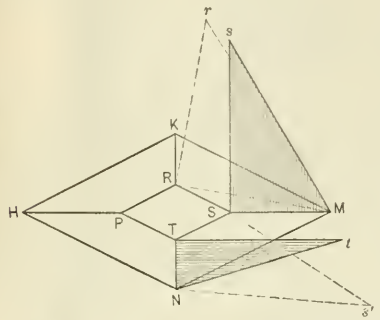

Fig. 146.—Triangles Drawn on Miter and Diagonal Lines in Plan.

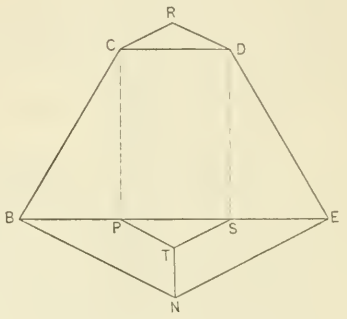

Fig. 148.—Pattern for Model.

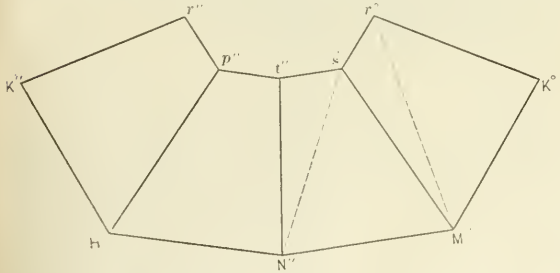

Fig. 147.—Pattern for Frustum of Pyramid Diamond Shape in Plan.

Fig. 149.—The Model.

PATTERN FOR FRUSTUM OF PYRAMID DIAMOND SHAPE IN PLAN.

showing the angle lines, or of the half article, draw the elevation B C D E, as in Fig. 148, below which lay out the half plan, as shown by B N E P T S. On C D draw the half plan of top, as shown by C R D. After having cut out the pattern and formed it at right angles on B E and C D, a triangle similar to G′ F′ J in Fig. 144 can be attached to the model with its base on T N and its apex at R. The dotted line from N in base to D in top, representing N S s' of plan, or N″ s'' of pattern, can be shown by means of colored thread. The finished model is shown in Fig. 149.

Starting in Business.

From VETERAN, *Brooklyn, N. Y.*—I presume that among your readers there are hundreds of young men, journeymen, tinsmiths particularly, who are inwardly debating the question whether or not they could successfully enter into business for themselves. It seems to me quite possible that one who has had 40 years of experience in the stove and tin trade might offer some advice that would tend to answer the doubts and fears as well as the over-confidence of these persons In naming the requisites for a start I would put capability first, then locality, and then capital as least of the three requirements for a small beginning, and it is of small establishments that I am to offer my advice, and in which advice is most needed. The one thing paramount is to let inclination have a good part in the matter. Men are so differently constituted that some never can or will work for another contentedly, no matter how pleasant or profitable their positions may be, and it was to this class that I belonged in early manhood and am still with. We live for happiness, and even though it may be an imaginary delight to be one's own boss and see one's own name over the door it is a reality to some. I and he must do it with his own hands, and do it well, too, so that each job will be a leader for another. If he finds it impossible to get along alone he can put on a good-sized, intelligent boy and take the trouble to show the boy that he can do lots of small jobs, and that he must keep his eyes open and his mind on the work, and that it is not such a wonderful thing after all to make a piece of pipe or mend leaky vessels. I will leave the man now where he is with his little chap. If he drinks and loafs he will fail, and if he deserves success he will find it. Little by little he will put up shelves and stock them with articles made in dull days or purchased with money saved, a dollar at a time, when he needed a new hat or coat, but all will come right in the end. If he puts the right spirit into his enterprise he will have some advice that would tend to answer the doubts and fears as well as the over-confidence of these persons In naming the requisites for a start I would put capability first, then locality, and then capital as least of the three requirements for a small beginning, and it is of small establishments that I am to offer my advice, and in which advice is most needed. The one thing paramount is to let inclination have a good part in the matter. Men are so differently constituted that some never can or will work for another contentedly, no matter how pleasant or profitable their positions may be, and it was to this class that I belonged in early manhood and am still with. We live for happiness, and even though it may be an imaginary delight to be one's own boss and see one's own name over the door it is a reality to some. I and he must do it with his own hands, and do it well, too, so that each job will be a leader for another. If he finds it impossible to get along alone he can put on a good-sized, intelligent boy and take the trouble to show the boy that he can do lots of small jobs, and that he must keep his eyes open and his mind on the work, and that it is not such a wonderful thing after all to make a piece of pipe or mend leaky vessels. I will leave the man now where he is with his little chap. If he drinks and loafs he will fail, and if he deserves success he will find it. Little by little he will put up shelves and stock them with articles made in dull days or purchased with money saved, a dollar at a time, when he needed a new hat or coat, but all will come right in the end. If he puts the right spirit into his enterprise he will have

some advice that would tend to answer the doubts and fears as well as the over-confidence of these persons In naming the requisites for a start I would put capability first, then locality, and then capital as least of the three requirements for a small beginning, and it is of small establishments that I am to offer my advice, and in which advice is most needed. The one thing paramount is to let inclination have a good part in the matter. Men are so differently constituted that some never can or will work for another contentedly, no matter how pleasant or profitable their positions may be, and it was to this class that I belonged in early manhood and am still with. We live for happiness, and even though it may be an imaginary delight to be one's own boss and see one's own name over the door it is a reality to some. I

think the general tendency in cities is toward small shops, depending on near-by local trade, and that a workman of fair ability can safely start in any location not already overstocked and can be as certain of success as it is possible to be in any new enterprise, and more so than in most small concerns, as his labor is a large factor. Work means success where the expenses are not too great. *Bradstreet's* reports that the failures among tinners are less than in most of the other lines of business.

My reason for naming capital as a secondary requisite is that but few men can lay by much from day's work and would never get into business if they thought capital of the first necessity. We will say that for a small beginning the workman has saved $200 and is anxious to open a store. Let him rent a small place—a basement will do for the first—but the rent must not exceed $25 per month. He can put half of his capital in tools, benches and fixtures, and buy stock as needed with the balance. Starting in March or April, he will find employment from the first day, some stoves in the fall, and people who have seen his efforts will go out of their way to trade with him. He has entered on a road where no one can limit his possibilities.

A statement of the commerce of the Argentine Republic for the year 1892, furnished by the consul in New York, shows that the exports thence amounted to $5,278,240 and the imports by direct trade were $1,819,600. Exports from New York comprised upward of $2,000,000 in agricultural machinery and implements, and something like $200,000 in hardware miscellanies, $10,000 in fire-arms, &c.

For the six months ended on December 31 the total exports of the Dominion were $74,258,707, an increase of $2,520,658. For the same period the imports were $60,272,922, an increase of $3,688,604, showing a total increase in trade of $6,209,262.

PLUMBING AND GAS FITTING.

A Re-election in the New York Master Plumbers' Association.

From G. T. M., *New York City.*—I notice there is published in *The Metal Worker* of January 28 a list of officers of the New York Master Plumbers' Association for the year 1893. That list is no longer correct, a new election having taken place under the following circumstances: Henry G. Gabay had been president for two successive terms, and at the beginning of the present year, in the face of some factional opposition, had been re-elected for a third term. The opposition ticket won two or three offices, but missed the presidency, and, smarting under the disappointment, the defeated party at once raised the cry that "the election was illegal and should not be allowed to stand." President Gabay called a special meeting of the association to consider the charges and take such action as a close investigation would demonstrate to be necessary. This special meeting, which was an exceptionally large one, was held in Jaeger's Hall, at East Fifty-ninth street and Madison avenue, on the evening of January 24, and the opposition ticket was so badly beaten that they lost whatever offices the previous election had secured for them. The following is the new and corrected list: President, Henry G. Gabay; vice-president, Thos. J. Toumey; recording secretary, Henry J. Pattison; financial secretary, Thos. J. Cummins; treasurer, Jas. N. Knight; marshal, Thos. F. Gaynor; sergeant-at-arms, Charles Schlosser. Was not this a regular case of "the dog and the shadow?"

Answer.—This action of both sides in the controversy shows that the members of the New York Master Plumbers' Association set some value on the fact of holding office in the organization. The recipient of the "third-term" election is to be congratulated on his popularity, even though public sentiment is opposed to such renewal of trust.

"Dog's Teeth" in Plumbing Work.

From P. H., *Stamford, Conn.*—Can you tell me what is meant by "dog's teeth" in the trade? I went to look up a job in a shop a few days ago, and the boss asked me how much I knew about wiping joints. I got on well enough until he asked me if I knew what "dog's teeth" were. I didn't know, and then he fired me. None of the fellows around here can tell me, and I have to ask *The Metal Worker* for the information.

Answer.—Our correspondent evidently has no knowledge of some of the phraseology of the trade, and probably considered that "dog's teeth" had only one meaning—that which is best expressed by the servant girl setting the house dog on the offending plumber who leaves a mess of dirt after him on completion of his job. That would not explain anything, however, beyond the possible rent in the overalls. "Dog's teeth," in a trade sense, are the little lumps of solder which sometimes run through a lead joint when it is being carelessly made and which are injurious in lead bends or traps as helping to retain some fragment of cloth, lint, &c., so as to cause the syphonage of traps by capillary attraction. They are only to be found in careless work, and where they exist there is certain to be considerable dissatisfaction some time or another when the seal of the trap happens to be broken.

Passage of Sewer Gas Through Traps.

From W. F. S., *Bayfield, Wis.*—I put a running earthen trap on a clean water waste pipe outside a building, thinking that would make it proof against sewer gas. The proprietor now tells me that if fresh water is not discharged through the trap for three or four days there is a smell of sewer gas in the office, and he says that a sanitary engineer told him that if the water in the trap is not renewed every two days it becomes porous and the trap will not be gas proof. Please advise me if this explanation is correct.

Answer.—Either the sanitary engineer did not thoroughly explain himself or used the word "porous" to denote the tendency of water to absorb gases. It is well known that water is not compressible, whereas if it partook in any degree of the character of porosity, the inference is that it *could* be compressed. As a barrier against the entrance of sewer gas the water seal of a trap may or may not be effective for a longer or shorter time, according to the conditions under which the trap is placed in position. If it (the trap) is not vented the chances are that the seal may be broken by syphonage, in which case there is no protection against the entrance of sewer gas. But as a safeguard no trap should be left unvented, because, independent of the danger of syphonage, there is the danger of saturation by sewer gas, and this is probably the cause of the trouble of which our correspondent complains. If he has neglected to vent the earthen trap he has provided no outlet for the dangerous gases from the sewer, and experiments made both in England and America have demonstrated beyond a doubt that the water seal in an unvented trap cannot remain pure for many hours. It begins to absorb the sewer gas at once, and if there is no other outlet, such as the vent pipe from the crown of the trap, when the point of saturation is reached it begins to give off on the house side the gas it takes in on the sewer side. The oftener traps are replenished, whether they are vented or not, the better. Returning once more to our correspondent's question, we have to say that though not "porous," water has a ready facility for "absorbing" gases, and in that sense alone he may accept the explanation of the sanitary engineer as to the necessity of renewing the water in the trap at least once every two days. We would also suggest that he should relieve the water contained in the trap from the pressure of the sewer gas at the sewer side by venting the trap in the usual manner at the crown.

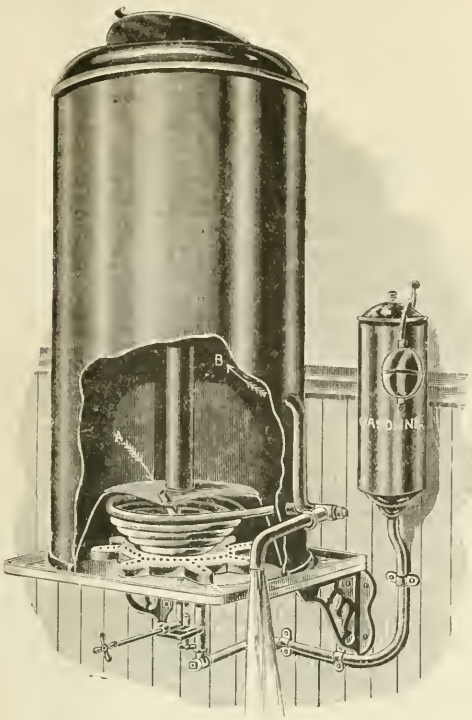
Plumbing Examining Boards.

From J. R. R., *Ogdensburg, N. Y.*—Noticing some reference in a recent issue of *The Metal Worker* to the law of last year relating to the creation of plumbers' examining boards throughout the State, I desire to ask if you can inform me if any definite steps are being taken to carry the law into effect. Has the Master Plumbers' Association of New York City any authority in the matter? Does the bill outline any fixed mode of procedure?

Answer.—The Plumbing law (chap. 620, Laws of 1892) has been put in operation in some of the cities of the State, notably in Rochester, Poughkeepsie, Yonkers and Utica. The Rochester board has adopted rules and placed the business on a working footing. The meetings are to be held on the first and third Mondays of each month at 8 p.m, at which applications for examinations of candidates for license will be received and dates for making the examinations fixed upon and notice thereof sent to applicants. No one will be allowed to be present at the examinations but the Board of Examiners and the applicants. The fee for examination (as fixed by law) is $5, and the applicant must state on oath and in his own handwriting his name and residence, how long resident in the city, his citizenship, names of former employers, his occupation during the five years preceding date of application, as well as the number of years he has been at his trade. The applicant must be vouched for by three reputable citizens, and of the maximum questions propounded 75 per cent. must be satisfactorily answered, and if not, a month must elapse before a fresh examination of the rejected applicant can be held. The Master Plumbers' Association of New York has no voice in the work throughout the State outside this city. The New York State Association, however, will hold its annual convention on March 2, at which a code of rules for all the cities in the State, except New York and Brooklyn, will, it is expected, be formulated, and the line of examination of candidates be marked out. The president and secretary of the New York State Association are members of the New York City Association; beyond that there is no connection between the two associations.

The Moseley Bathtub and Water Heater.

In the accompanying illustrations we show the Moseley improved heater and also the Moseley folding bathtubs with the heater attached, made by the Moseley Folding Bath Tub Company, 181 South Canal street, Chicago. A chief advantage to which the manufacturers allude is that the apparatus does away with the necessity of hot fires in summer for providing warm baths. It also takes up but little room, is attractive in appearance, and does not require any cutting of the carpets or fastening. The heater, as shown in Fig. 1, comprises a tank to hold 20 gallons, made of No. 28 galvanized iron with cast top and concave bottom of heavy pressed galvanized steel. The exterior is enameled and the whole finished with nickel trimmings. Another form of heater is made of 14 ounce copper, nickel plated with nickel-plated bracket and fittings. At the bottom, as shown in Fig. 1, is a 12-foot coil of ¾ inch copper pipe in the form of an inverted cone resting upon the center of the burner, so that the flame covers the entire surface. A 1¼-inch tube extends vertically through the tank and gives ventilation, at the same time facilitating combustion and increasing the heating power of the burner. The water enters the tank at the point A, passes to the lower section following the course of the spiral coil in contact with the flame. As it becomes rapidly heated it rises through the stand pipe outside and is delivered back into the tank at B, the heated water passing to the surface and the cooler downward into the coil, where it is further heated and a continuous circulation maintained. The hot water is drawn directly from the coil. Besides being adapted to the Moseley self-heating folding bathtubs, it is also useful for stationary bathtubs, for kitchens, laundry use, &c. Special sizes are made to order if required. The Moseley self-heating folding bathtub is shown in Fig. 2. The manufacturers mention its handsome finish, and point out that it gives a full equivalent of the modern bathroom, so far as the bath is concerned, with the advantage of quick and independent heating, it consisting of a full-sized 10 or 12 ounce zinc or 14 ounce copper-lined bathtub, water tank heater and waste water outlet. It is finished in various ways and several styles are furnished by the makers. Each tub is provided with a flexible outlet with brass couplings, one of which fastens permanently to the tub, while the other may be connected to ordinary gas or lead pipe or tubing, leading to any waste water outlet in the building, or else the contents may be emptied by means of connecting tube into any receptacle. Having a fixed journal bearing, the top has a positive action in raising and lowering, so that the use of casters and slides is avoided. The adjustable back supporting the tank forms a counterbalance to the top, rendering its manipulation very easy. The tub is made in two lengths and measures 2 feet wide, 18 inches deep and 5 feet and 5 feet 6 inches long, respectively, occupying a floor space when closed about 2 feet square. Its weight when crated for shipment is about 250 pounds.



The Moseley Bathtub and Water Heater.—Fig. 1.—Moseley Improved Water Heater No. 3.

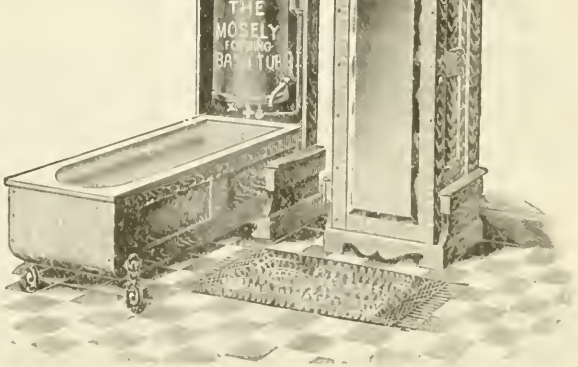


Fig. 2.—Folding Bathtub Opened and Closed.

Albany Plumbing Work.

The past year has been a very prosperous one for plumbers in this locality, says our Albany, N. Y., correspondent. There seems to be no particular reason for it, except that there has been a great deal of building, and that necessitated a great deal of plumbing. Every plumber in the city is crowded as hard as can be with what are technically known as "thawing jobs." Plumbers, however, claim that these are the most annoying and unremunerative pieces of work they have. In the first place, very little, if any, new material is used, and it is generally merely ditch digging. Plumbers have to do it, however, to oblige their customers. The men who make money out of such odd jobs are the small firms who do not pretend to do a wholesale business. Every plumber of that class is hard at work all day "thawing," and they can do it at a pretty fair profit. The unusual amount of such work has been caused by the lack of snow. This has allowed the frost to go down into the earth to a depth of more than 4 feet, and that is quite unusual. Snow protects the earth, and consequently the water pipes. Now, to get at those parts and thaw them is only manual labor and not plumbing at all. It is a mistaken idea that a freezing cold spell is the plumbers' ideal. Any one of them would rather a great deal that the building trade would have a decided and continuous boom. That is what pays, when new material and plenty of it is used. But the former impression is the one that has become broadspread and is the prevailing one. There seems to be no means of preventing this continual freezing. The idea that plumbers rejoice in cold weather origi-

nated in all probability from the fact that they are so busy at that time, and the general public believe that when a man is very busy he must necessarily be making money.

How to Set a Boiler.

From E. O. H., *Melrose, Mass.*—I see in *The Metal Worker* of January 7 a letter from "Young Mechanic" with regard to the hight of a range boiler. Does the answer, though correct in principle, correspond with the practical experience of a majority of mechanics or plumbers? I would like to relate an instance that came under my notice a short time since. The range is connected as in Fig. 2 of your illustrations, which gave trouble in supplying hot water, and also produced a hammering noise. The party selling the range claimed the trouble was with the plumbing, and that it would not work until the range boiler was raised up. I was notified to do the job and did not agree with the stove dealer—at least I thought I would put a coil of pipe in the stove in place of the water front, after which there was plenty of hot water and no hammering. I can account for the result as far as the hot water goes, for the capacity for heating in the coil was greater than in the water front, but if you follow the theory to a conclusion, ought we not to expect the hammering to increase rather than to diminish, the pipes or boiler not having been changed in the least? I would say that the water front and range connection had been thoroughly examined previous to any change being made and no obstruction was found. I would also say that at least 19 out of 20 boilers in this vicinity are lower than the ranges they are connected with.

Note.—Very likely the reason the coil gave less trouble than the water back is that there was a certain natural circulation in the coil, while in the water back (though we do not know what its construction was, we assume it was a hollow casting), there were cross currents to interfere with the proper circulation. This may explain why the coil gave better results.

Plumbers' Wiping Cloths.

From W. H. S., *Bay Shore, N. Y.*—Please inform me through the columns of *The Metal Worker* where I can get plumbers' wiping ticking for joint wiping.

Answer.—We cannot do better than refer our correspondent to any local dry goods store, for the cloth he speaks of is nothing but ordinary heavy-twilled ticking. Of course a good deal must be done to prepare it for a wiping cloth, having to be soaked in tallow and folded in a particular fashion, as described in former issues of *The Metal Worker.*

TRAPS AND VENTS.

The Oswego Indurated Fiber Company, Oswego, N. Y., with New York salesroom at 1337 Broadway, send out circular sheets presenting half-tone engravings of carved Eburite fiber bathtubs Nos. 30 and 31 of their manufacture. These goods are exceedingly attractive from the appearance of the engraving, which presents a very soft effect. The cuts show bathtubs, closets and flushing tanks.

We learn from a correspondent at Oakland, Cal., that the plumbing business is not very prosperous in that section just now. He writes: "The plumbing trade on the Pacific Coast is dull, very dull, and the immediate outlook for the plumber is very poor indeed. But we are hoping for the best. Some say the dullness is caused by the Presidential election and the World's Fair, and that things will be livelier later. But I think the real cause is that we have not enough men here who are willing to invest in and help to build up our cities. Unions cannot attempt to run capitalists, because the latter can lend their money at interest; and they find this a safer investment than speculating by investing in some business which they are liable to lose by strikes."

The Stradling Plumbing & Heating Company of Utica, N. Y., have elected: Directors, E. W. Stradling, E. J. Stradling, E. H. Bice, A. H. Dobson and John J. Droz; president, E. W. Stradling; vice president, E. H. Bice; secretary, E. J. Stradling; treasurer, A. H. Dobson.

Henry Huber & Co, New York City, have received an order for an Oswego indurated fiber bathtub for His Royal Highness the Prince of Wales. The tub is very handsomely finished, being embossed and traced in gold, and the fittings are silver-plated.

J. H. Ellenbaum, the Niagara Falls, N. Y., plumber, now located on Falls street, will erect a three-story brick building facing on Niagara street. It will be a handsome business block.

Benjamin E. Patterson, New York City, is the patentee of an improved gas governor, the invention relating to gas governors having outer and inner walls, the object being to produce a simple, compact and durable governor, which shall regulate the flow of gas and deliver it under all conditions at a steady pressure. The regulating valve and well floats for actuating it are arranged so that the movement of the valve shall be steady.

Beck Bros. & Co., manufacturers of fine brass goods for water, gas and steam, 259 Wabash avenue, Chicago, are to place a line of new water closets in their salesroom.

H. O. Canfield, Bridgeport, Conn., issues an illustrated catalogue and price-list of vulcanized rubber which he makes for mechanical and manufacturing purposes. A number of these goods have special interest for plumbers and steam and hot-water fitters. Among the articles referred to, with illustrations and price-lists, are the Eureka bibb disks, Canfield bibb disks, Canfield's pure molded flange Unions, flange rings for seating closets, rings for steam fitters' and plumbers' use, gaskets, &c. The little circular gives illustrations of the goods with prices and full lists of sizes.

The Oswego Indurated Fiber Company, Oswego, N. Y., are offering to the trade a new tub of indurated fiber lined with polished copper. The chief advantages of this article are referred to. An illustration of the tub is shown, together with price lists of the different sizes.

Henry Kerr, Cleveland, Ohio, is the patentee of a sink or basin trap, the object of which is to furnish a trap in which utility and artistic effects will be combined. Constructive features of the trap are a diaphragm and ball valve.

John Pellow, Grand Rapids, Mich., has invented a combined water heater and shower bath consisting of tubular sections of different diameters having cups at the ends and a casing surrounding the section. Also spiral coils within the section.

F. E. Myers & Bro., Ashland, Ohio, have contracted with the Crane & Ordway Company, St. Paul, successors to the Crane Company and Rogers & Ordway, for a large number of Myers' Glass Valve Seat Well and Tank Pumps. F. E. Myers & Bro. desire to refer all dealers in Minnesota and North and South Dakota to the Crane & Ordway Company as their exclusive agents, who, freights considered, are in a position to supply the trade at satisfactory prices and terms. F. E. Myers & Bro. advise us that four carloads of these goods have already been ordered by Crane & Ordway Company, who will carry a stock which will meet the large requirements of their territory.

The St. Joseph Pump Company, St. Joseph, Mo., manufacturers of the well-known Perfection Water Elevator and Purifying Pump, favor us with a copy of their calendar for 1893. The calendar proper is mounted on heavy cardboard back, the upper portion of which contains an attractive picture in light blue, showing three interesting children in the act of using one of this company's pumps. The lower part is devoted to the calendar proper, comprising 12 calendar sheets. Some advertising matter is placed on the front of the calendar, but not enough to mar its beauty. A silken cord is attached for the purpose of hanging the calendar.

Sealed proposals will be received at the office of the custodian, United States Custom House, Galveston, Texas, on February 16, for all the labor and materials required for new water closets for the new Custom House Building.

J. A. Cunningham, 217 Lake street, Chicago, agent for the Smith & Anthony Stove Company, reports that the Sanitas plumbing specialties have been used throughout in the Art Institute building.

The long-pending revolution in the Hawaiian Islands has taken place, and the Provisional Government, whose members are mostly American born citizens or their descendants, are represented in Washington city at the present time by an influential deputation instructed to urge annexation to the United States. American interests in the islands are said to equal $30,000,000—three-quarters of the entire foreign investment. One of the most prominent business men of Honolulu states that Honolulu, the capital, has a population of 23,000, while the population of the country is 90,000, and the area of the Hawaiian Archipelago is equal to that of Connecticut, Rhode Island and Delaware. During 1891 the percentage controlled by the United States of the total trade of the islands fell off 4 39 per cent., but it was still enormously in the lead. During that year the total imports of the islands were valued at $7,439,482.65, of which 71.16 per cent., or $5,294,278.57, were imported from the United States. Great Britain in the same year sold the islands $1,201,329.43 worth of goods, or 16.15 per cent. of the total imports. During the same year the total exports of the islands were $10,258,788 27, of which the United States took nearly all. Last year sugar culture in the islands is said to have been without profit.

James A. Tilden, Hyde Park, Mass., has assigned to the Percy Mfg. Company of Portland, Maine, an improvement in water meters. The invention relates to the class of meters known as disk meters and comprises various details of construction introduced with the view of obtaining greater efficiency, accuracy and durability.

The Hebrew Technical Institute in Stuyvesant street, New York, seeks to aid young men who have an aptitude for mechanics. Last year the average attendance was 138 and 32 graduated, of whom 75 per cent. obtained desirable positions.

WORLD'S FAIR NOTES.

The Work of Installation.

Preparations for putting exhibits in place are now complete. W. H. Holcomb, general manager of the little railroad in Jackson Park, has organized a force of employees for installation purposes, and is ready to handle displays as rapidly as they arrive. When these exhibits commence coming into the park Mr. Holcomb's railroad will probably do more business to the mile than any other line in the country.

It has become apparent during the week that the great volume of exhibits will pour into Jackson Park in two months, from February 15 to April 15. Isolated displays will arrive in small quantities before the middle of February and a few may be received later than April 15, but the great bulk of the displays will come to the park between the dates named. Various estimates have been made of the volume of these exhibits, the figures ranging all the way from 15,000 to 30,000 carloads. The quantity cannot be determined accurately, because many foreign countries, especially the larger powers, are extremely reticent in regard to both the character and extent of their displays.

The plan of installing exhibits brought out by the Council of Administration, after the long discussion between Director-General Davis and Chief Burnham, is working satisfactorily. Under this plan Mr. Holcomb takes charge of the displays as soon as they are switched into Jackson Park. If the exhibits have been properly passed by customs officials at ports of entry they are hauled directly to the buildings for which they are intended, otherwise they are taken to the custom house on the grounds and examined by a number of inspectors. Director-General Davis has requested, in order to simplify the work of installation, that all packages intended for a particular building be loaded in one car, in order to avoid extra handling. The forces under Colonel Davis and Mr. Holcomb are working in perfect harmony in putting exhibits in place. Mr. Holcomb has two men in each of the big buildings, one to study the assignments of space and indicate the spot where each package is to be put and the other to give a receipt for the delivery of the goods. Tracks have been laid in all the buildings from the spurs of the little railway, so that cars are pushed directly into the buildings. As soon as packages have been taken from trains and deposited on the space marked off for them on the floors Mr. Holcomb's duties end. His men withdraw and the exhibitor and department chief attend to the arrangement of displays.

Mr. Holcomb has issued instructions regarding the handling of goods that come to Jackson Park in wagons, drays or trucks instead of cars. These must be brought to the Sixty-fourth street gate. In order to preserve the boulevards and driveways which have been made at great cost, it is necessary to prescribe the width of tire for these wagons. One-horse vehicles must have tires 3 inches wide and tires of two-horse wagons must be 4 inches wide.

A toll of 6 cents per 100 pounds, with a minimum charge of 50 cents for any single shipment, is levied to pay the cost of putting exhibits in the buildings. Articles weighing more than 10,000 pounds and fragile packages are subject to additional charges. Each load of displays must be accompanied by a bill of lading, with specific information regarding the exhibitor's space number, name and weight of each article, total weight of shipment, name of building for which intended and a separate bill of lading.

The exposition terminal charge will be collected at the scale house at Sixty-fourth street by an authorized representative of the exposition, who will deliver to the person in charge of the consignment a receipt in full for the amount collected. When exhibits are delivered to the building designated the person in charge of the exhibit must surrender the bill of lading to the superintendent, who will give him a receipt for the property delivered. Any person in charge of exhibits consigned to Jackson Park delivered by wagons, drays or trucks must present for inspection at the scale house a city weigher's certificate, giving the weight of the vehicle in his charge. In no case will exhibits be received for installation unless the rates quoted are paid at Sixty-fourth street entrance.

Intending exhibitors make a mistake in not prepaying all freight charges on their exhibits. The charges do not end at Chicago, but include the switching rate to Jackson Park and the additional charge of installing the goods. Many of the exhibitors fail to prepay these latter charges and as a result their exhibits are stored in warehouses in the city and do not reach their destination. The Exposition Company pay no freight. If the charges are not prepaid by the exhibitor his goods will be left somewhere outside of Jackson Park and much difficulty will be experienced in discovering just where the railroad company have side tracked his display.

California's Enterprise.

California seems to have entered into the work of preparing an exhibit for the exposition with a resolve to outdo all competitors. With a vim and vigor characteristic of the people of that State, displays have been prepared showing the varied resources of the empire west of the Rockies. In each of the great buildings space has been assigned to California, and the State Commissioners are now preparing to begin installation.

Even in the matter of preparing an office building California has aimed to excel. And those who have seen the unique structure near the Fifty-ninth street entrance, which is now nearly complete, will admit that the aim has been realized. The building is a reproduction of one of the old Dominican Mission Chapels of Southern California. In appearance it is decidedly interesting, and so faithful has been the work of reproduction that romance seems to cling to the rough stone walls. The architect departed from the original only to interject enough of the more ornate Moorish style to relieve the somber effect. The building is a clear story with a great flat dome as a crowning feature, and the semi-tropical appearance will be hightened by roof gardens. The measurements of the structure are 500 x 110 feet, and the elevation of the dome is 80 feet. In this building Schmid's colossal figure, typical of California, will be a feature. It was recently exhibited in San Francisco, where it created much favorable comment.

While exhibits will be made in every department, California expects to make particularly fine displays in the departments of mines and mining, agricultural and horticultural. In the first will be demonstrated its mineral resources, and many relics of the days of '49 will be shown. In the department of agriculture will be shown fruit and cereals, and in the horticultural hall will be the wine exhibit.

The ladies of California have taken an active interest in the fair, and have secured the right to decorate and furnish one of the reception rooms in the Woman's Building. This will be known as the "California Room" and will be one of the most attractive departments in the entire building. The redwood lumber dealers furnished the wood for the panels, and $2,000 was raised to pay an expert for the carving and graining. The cactus was taken as the motive of the decoration, and will be shown in every feature of the room.

Myriads of Banners.

On the entire grounds of the Paris exposition there were not one-third as many flag poles as will be in use at Jackson Park this summer. In the construction of the various World's Fair buildings and in the disposition of liberty poles about the grounds, the management has afforded the widest scope for utilizing flag decoration. Since last November flag designers and makers have been at work under the general supervision of F. D. Millet, director of decorations. It is probably within the truth to say that the result by May 1 will constitute an epoch in the use of bunting. Scores of busy fingers and dozens of machines are working every day in the southwest corner of Horticultural Hall, turning out the creations of able designers in the form of flags, banners and skylight draperies. These are carefully stored away until the auspicious day arrives, when the completed buildings will burst into a kaleidoscope of color, with banners fluttering from every pole and minaret on the spacious grounds.

The national flag will predominate. But, as it is to be a cosmopolitan fair, there will be also a prodigal use of the flags of all nations. Mr. Millet and his assistants have compiled a complete code of all the nationalities that boast a national emblem. They number 46, or, with the United States, 47. Most of these nationalities are exhibitors at the Fair, but some are only nominally represented as compared with others.

But the flags will be only a small portion of the bunting decorations. Probably four-fifths of the poles on the various buildings are for banners. Here is where the inexhaustible resources of the designers come into play. Not alone are these hundreds of banners to be a symphony in color as they wave in the sunlight; they are to be something more than a creation in harmonious light and shade. They will tell an allegorical story of the progress of the world which the exposition commemorates. On each building the banners will be an artistic index of the character of the exhibits inside.

For instance, on the agricultural building every pole will bear a different design. Plows, harrows and scores of implements, ancient and modern, will be represented. On Horticultural Hall there will be floral designs on the banners. There will be roses and lilies that will apparently stand without support, rising and falling with the alternate swell and subsidence of the summer breeze. On the great Manufactures Building the number of separate designs and their beauty can only be hinted at. On the Mines Building the banners will represent in an artistic way everything produced. On the Transportation Building the banners will show the progress of transportation methods, from the earliest to the latest. On the banners of Machinery Hall there will be very few of the great developments in machinery not represented.

For the interior of the buildings there will be an enormous quantity of bunting used in the form of skylight draperies. Every building on the grounds is so well lighted that these draperies are necessary to soften and subdue the tones. Here again comes into play the general scheme of harmony of color and artistic effects. For instance, in the Manufactures Building the prevailing tints in the skylight draperies will be cream and corn; in the Agricultural Building, dark green and Nile green; Mines and Mining Building, shrimp and cream; Electricity Building, light blue and cream;

Transportation Building, Nile green and cream, and so on. In the Horticultural Building there will be so much natural coloring from plants and flowers that cream alone will be used in the draperies.

The amount of bunting necessary to make these draperies can be judged from the following figures: Manufactures Building, 148,000 square yards (1780 square yards in one skylight alone); Agricultural Building, 63,000 square yards; Mines and Mining Building, 70,000 square yards; Transportation Building, 64,000 square yards; Electricity Building, 81,000 square yards; Machinery Hall, 93,000 square yards (including annex); Horticultural Hall (including dome), about 74,000 square yards. Besides the skylight draperies, there will be an opportunity in several of the buildings for festooning with bunting between the arches. This will take a liberal supply, and the same harmonies in color will prevail.

Unique Railroad Exhibit.

Full-sized models of the first and oldest ten railroad locomotives in the world will be shown in a special exhibit to be made by the Baltimore & Ohio Railroad in the Transportation Building. J. B. Pangborn, who has charge of the display, has already begun to make arrangements for its installation, and when completed it will be one of the most unique and instructive collections at the park. From the first locomotive that was built the evolution up to the present time will be shown and 34,000 square feet of space will be occupied.

Models of three of the old George Stephenson engines will be shown—the famous Rocket (1829), the Blanche (1816), and Mercury (1830). Full sized duplicates from the working drawings of Puffing Billy (1813), the first locomotive with smooth wheels for smooth rails, and the Sans Pareil, in which the steam blast was first introduced. From drawings in the Paris Conservatoire full-size reproductions have been made of the Cugnot (1769), the oldest locomotive in existence, and the Segrim (1827), the first locomotive in the world with multi tubular boiler. Experts in Europe who have seen these reproductions pronounce them marvelous achievements and say it is hardly credible that iron, brass and copper could have been so successfully counterfeited.

The exhibit begins with the first method of steam propulsion on land—that of Sir Isaac Newton in 1680. Thence the continuous evolution is indicated to Trevithick and his initial design of the father of the locomotive (1800), and the first (1803) that ever ran on rail.

In 1830 the Cooper was tried on the Baltimore & Ohio Railroad. This was the first locomotive built in America, the first to draw a car, and the first to run more than a mile.

The Baltimore & Ohio have many venerable and valued relics of primitive construction. Four of their original grasshopper engines are still in the company's shops. These will be shown exactly as they appeared when first set to work. The Perkins ten-wheeler (1863), the earliest type of the powerful freight locomotive built for heavy grades, and the "600," the first Mogul ever constructed, and which was exhibited at the Centennial, will be shown full size and in motion. An exceptionally interesting feature will be the Peppersauce (1865), the first mountain climber and the first that ascended Mount Washington. All the old-time examples of locomotives will be mounted on the rails and roadbed of their respective periods.

Will Put 15,000 Men at Work.

Cold weather has a marked effect on the army of employees at Jackson Park. Fully half the force of laborers was retired. Only 5300 men are now at work in the park, but some time before the gates open, perhaps as soon as the ice goes out of the lagoons and the snow runs off the roofs, more than 15,000 men will be at work. The laborers have been concentrated inside the buildings during the cold weather. All the men employed in road making, landscape gardening and other out of door work will be called back to put the grounds in condition for opening day.

Thirty-five State buildings are almost done. The joint territorial clubhouse built by Arizona, New Mexico and Oklahoma is just getting under way.

Chief Skiff's tunnel, under the Mines Building, to show the interior workings of a mine and give practical illustrations of removing ore, is almost finished. Mr. Burnham's men say Machinery Hall, which it was thought would not be ready in time for the opening, will be completed by March 15.

New York Reception Committee.

Director-General Davis has named seven prominent citizens of New York City to act as a committee to receive distinguished foreign guests *en route* to the exposition. He selected Charles S. Smith, Henry W. Cannon, Cornelius N. Bliss, A. E. Orr, F. Lynde Stetson, Charles R. Flint and J. Edward Simmons, and all of them have accepted the appointment and expressed their willingness to serve as members of the committee.

Charles Stuart Smith is president of the Chamber of Commerce and a director of several banks. He is a member of the Union League, Century and Players' clubs.

Henry W. Cannon is president of the Chase National Bank and was a delegate to the recent international monetary conference at Brussels.

Cornelius N. Bliss is first vice-president of the Fourth National Bank and the head of the dry goods house of Bliss, Fabyan & Co.

Alexander E. Orr is a grain merchant, a director of four railroads, including Rock Island and Union Pacific, is interested in several national banks and trust companies and is vice-president of the Chamber of Commerce. He is also manager of the David Dows estate.

Francis Lynde Stetson is a leading lawyer of New York and a partner of President-elect Cleveland.

Charles R. Flint is a merchant and lawyer, who was formerly in partnership with ex-Mayor Grace. He is largely interested in the South American trade.

J. Edward Simmons is one of the leading financiers of New York and president of the Fourth National Bank.

Documents Proving the Danish Discovery.

Under certain rigid conditions the Danish Government has consented to lend to the exposition documents purporting to prove that America was discovered long before the man in whose honor the fair is being held landed on Watling's Island. These documents might appear out of place at the Columbian Exposition, but they are likely to be on exhibition. Clark E. Carr, Minister to Copenhagen, says that these Icelandic sagas are known as the "Codex Fluteyensis." He adds that notwithstanding the serious doubts that have arisen in Copenhagen as to the propriety of sending the manuscripts, the Government will send them on certain conditions. One of the terms is that the volumes shall be brought back at the close of the fair in a ship of war belonging to the United States Navy, and that every precaution shall be taken during the exposition to protect them from damage. It is stipulated, in a letter to Secretary of State Foster, that the volumes must be kept in an isolated place, where they will be free from danger from fire, and that in the event of their loss the United States shall indemnify Denmark to the amount of at least $20,000.

These documents are regarded by the Danish Government as furnishing conclusive proof that Columbus was not the first European to reach the shores of the new world. The papers have never been exhibited at great expositions, but as a special compliment to the United States they will be sent on the conditions named. The Government of Denmark is willing to intrust them to Commissioner Mier, who will organize a strong guard to accompany the papers.

Miscellaneous.

The long delayed steamship "Gardopee," bringing the first consignment of the Krupp gun exhibit for the World's Fair, arrived in Chesapeake Bay on the 22d ult. The vessel was 29 days coming from Hamburg. A train of 21 cars, specially constructed for the great weight they are to carry, were at the Maryland Steel Works at Sparrows' Point ready to take the guns to Chicago.

The block coal operators of the Brazil, Ind., district met on the 27th ult. in response to a request from Commissioner Havens of the World's Fair Commission, to take steps toward sending a coal and clay exhibit to the World's Fair at Chicago. It was unanimously agreed to send an exhibition and spare neither time nor money to make it a credit to the block coal district. It was agreed not to consider quantity but quality. The coal will be carefully selected and washed, when it will glisten like anthracite coal. The clay will be sent in the raw form. An architect has been employed to arrange the exhibit to the best advantage.

At a recent meeting of the Advisory Council of the World's Congress of Electricians to be held in Chicago this year it was decided that the meetings should last one week, beginning August 21. Fifty-five delegates from the leading countries of the world are expected to be in attendance.

The Inter-Continental Railway Commission have prepared a *fac-simile* in miniature of Central and South America to show the surveys of the proposed railroad intended to unite the systems of North and South America. The work was done by E. E. Court of the hydrographic office, and is a faithful representation of the topography of the countries named. It is about 25 feet long, and will be sent to the World's Fair as a part of the Government exhibit. In addition to the lines surveyed for the railroad the map also shows the routes of the present and prospective steamship lines from North to South America, with the names of their terminal ports and intermediate stopping points, if any.

Germany's $150,000 World's Fair building at Jackson Park was dedicated last Friday. It was Emperor William's thirty-fourth birthday and Herr Wermuth determined to celebrate it in America. Herr Wermuth is the Emperor's World's Fair Commissioner. He gave all the German workmen a holiday and invited exposition officials to be present at the dedicatory exercises. Herr Wermuth did not speak of it in this way. He called it a "richtfest," which translated into English is about equivalent to a "barn raising." The building is not yet completed, but the roof timbers are up and at that stage of a German building it is ready for the richtfest.

Aside from financial perplexities Argentina is prosperous. Exports are once more upon a very large scale. The agricultural classes are doing well, and railway traffic is increasing. Trade is better, too, in Uruguay; Chili is recovering from the effects of the civil war, and the Brazilian Government is adopting a wiser policy.

Steam and Hot-Water Circulation

Manufacturers of Heating Boilers.

After a brief and ineffective existence the United States Steam and Hot Water Heater Manufacturers' Association came to an end at Buffalo on January 26. The dissolution of the organization was due to the withdrawal of the American Boiler Company, the recently organized concern which bought out the boiler business of the Pierce, Butler & Pierce Mfg. Company, the Richardson & Boynton Company, and the National Hot Water Heater Company. The reason given by the American Boiler Company for withdrawing from the association was, that being organized under the laws of the State of Illinois, it was impossible for them to have any connection with an organization designed to control prices in any way, for, as is well known, the law of Illinois in such matters is very strict.

What the future of the trade will be remains to be seen—whether it will result in keener competition or whether the unsuccessful attempt to regulate prices will have an indirect influence in maintaining the market cannot yet be determined. In addition to the American Boiler Company, steps are being taken to control the sale of one other well known, and perhaps more, heating boilers. The negotiations are progressing favorably so far, and if completed the announcement will probably be given to the trade within a week or two.

A Satisfactory Heating Job.

From S. N. H., *Richmond, Maine.*—We recently put in a hot-water heater in our place of business, and perhaps the experience we had will interest your readers. The building is 60 feet long and 25 feet wide, with store 10 feet high, having 15,000 cubic feet. We used 220 feet 1¼ inch pipe and 90 feet of 1-inch pipe, arranged in coils of 4 pipes each; or, rather, we used it in pipes of different lengths with return bends, so that we got 150 feet of radiating surface, and yet we had the store heated comfortably and cheaply. Our workshop is in the basement, so that in it the heater, together with the flow and return pipe, gave all the warmth necessary. Now, what I want to call the attention of the trade to is that on like jobs are not pipes better than radiators? By placing the pipes in different parts of the room can you not with less fire and less surface do more and better heating?

Stopping Leaks in Steam Pipes.

From G. H. A., *Jersey City, N. J.*—Replying to the letter of "J. R.," Norwich, N. Y., that appeared in *The Metal Worker* of January 21, who wished to be informed how to stop leaks in steam and hot-water pipes without taking them out I would suggest that he take a strip of tinfoil and place it over the leak, using a cold chisel to calk the foil in, tapping the chisel very lightly. For all steam and hot-water work two parts sal-ammoniac, two parts sulphur are very useful. By using this preparation your correspondent will never have any trouble with his work.

HEATING NOTES.

William J. Jackson, Philadelphia, Pa., is the patentee of a radiator which consists of a closed steam space with vertical air flues, the steam entering the top, and a conical discharge nozzle leading from the steam space near the bottom into the supply pipe. A feature of the invention is the well formed in the bottom of the radiator with the conical nozzle alluded to.

We are indebted to the A. A. Griffing Iron Company, Jersey City, N. J., for a batch of circulars of some of their specialties. One circular relates to the Bundy Renaissance high art radiators and also gives information about the Bundy improved duplex radiator base and the Bundy art tile radiator. Other circulars relate to the Bundy Elite radiator and the Elite direct indirect radiator. The third directs attention, with illustrations, to the Defiance steam radiator, while another circular of interest to the trade gives samples of the Bundy radiator enamels showing specimens of a variety of colors.

The stockholders of the Harell Steam Heating Company of Dunkirk, N. Y., have voted an increase of capital stock from $40,000 to $100,000. The company will erect several new buildings equipped with machinery to manufacture cast-iron radiators. The company have not been able to fill a large number of orders on account of limited facilities During the past two years they have greatly improved their methods of manufacturing. New and valuable patents have been added to their list. The outlook for the company is a bright one.

M. E Herbert, St. Joseph, Mo., is the patentee of a new form of hot water boiler, the claim made for it being that it is simple in construction and is cheaply built, so that it comes within the reach of the average house owner. The boiler consists essentially of a hollow top forming a water chamber, a water leg depending from it, longitudinal water tubes connecting side pipes at the bottom and tubular grate bars.

The John Davis Company of Chicago have purchased a lot 297 x 100 feet on Ohio street, near Market, on which they intend to erect a large factory for the manufacture of steam-fitters' supplies.

Under date of January 31 the National Hot Water Heater Company announces the sale of their entire business to the American Boiler Company. In the announcement they give a list of the offices of the latter concern and state that the manufacture and sale of the Spence hot water heater and the Solell safety steam boiler will be vigorously prosecuted by their successors.

Under date of January 31, the American Boiler Company issue a notice to the trade announcing the purchase of the business of the Pierce, Butler & Pierce Mfg. Company, the Richardson & Boynton Company and the National Hot Water Heater Company, so far as pertains to the manufacture and sale of their extensive line of steam and hot-water boilers. They refer to their stores at 195 Fort Hill Square, Boston; 94 Centre street, New York; 34 and 36 Dearborn street, Chicago; 507 Mining Exchange, Denver; 80 Crocker Building, San Francisco, and 127 Sixth street, Portland, Ore., where they have superior facilities for meeting the wants of the trade.

E. O. Drake of Royal Steam Heater Company, Gardner, Mass., is about on the road in the interests of the heater, and incidentally putting in good words for Central Oilgas Stove Company's extensive line.

Broomell 'Schmidt & Co., Limited, York, Pa., favor us with an extensive illustrated catalogue of the Heatencook range of their manufacture; this combination apparatus for cooking and hot-water heating having been described at some length in *The Metal Worker* when it was brought out. We understand that it has had a large sale and has given satisfactory results. The catalogue, of oblong shape, contains 40 pages and presents numerous illustrations of the apparatus, both sectional and general views There are also cuts showing transverse views of houses, illustrating the installation of the Heatencook range and the method of connecting radiators. Another circular from the same concern illustrates and describes Our Own radiators for steam and hot water which they manufacture.

Gilbert T. Brewer, Hoboken, N. J., is the patentee of a hot water heater for cars. The invention combines a stove, hot-water condenser, and tank with intermediate circulating pipes, the steam heater consisting of a steam tank located within the water tank.

Miles L. Clinton, Ithaca, N. Y., has patented a steam boiler for heating purposes of the horizontal sectional type. The object of the invention is to improve the construction of the fuel magazine and means of operating the dust gates and other portions of the boiler.

Joseph E. Watts of Lawrence, Mass., is the patentee of an apparatus for regulating the temperature in combination with radiators, the apparatus consisting of a room thermostat and an upright weighted diaphragm connected with the damper; also of a valve loosely mounted upon its bearings and adapted to be opened in one direction by fluid pressure and in the other by electricity.

The import trade of the country is concentrating in New York year by year. In 1891 New York's share of the imports was 62¼ per cent.; last year it was 63¼ per cent. Exports from New York are in the same proportion for the two years, viz., 44⅞ per cent. In other words, of the total imports of the country, amounting to $915,375,377, New York received $572,613,259, and of $1,050,892,197 exports New York handled $377,722,985. In the import trade Boston and Philadelphia are next in importance, and in exports New Orleans and Baltimore are next.

ROOFING AND CORNICE.

Designs in Slate Roofing.

The variety of forms into which the slate of commerce may be cut for the purpose of producing pleasing designs in the covering of a building afford ample opportunity for the disply of artistic talent on the part of the practical roofer. That this ability is possessed to a greater or lesser degree by many engaged in the building trades is evidenced by the large number of engravings in recent issues of the *Illustrated Carpenter and Builder*.

Walking along a quiet country road some half a dozen miles from one of our largest provincial cities, the writer noticed a highly ornamental design worked out in the roof of a little roadside cottage. It was formed with light gray or greenish slates among the usual dark blue slates so commonly used. The center slates were light; some dark ones completely surmonotonous, are not brightened with a little ornament. When one considers the miles of slated roofs seen when traveling by rail, car or omnibus, what an extensive field for decoration there lies dormant! Perhaps it may be urged there is not much scope for ornamenting roofs. Well, that may be so. But has the most been made of this matter that can be made? The example already mentioned emphatically answers no; and the reader, it is hoped

DESIGNS IN SLATE ROOFING.

roofs which may be seen at the present day composed of slate, the patterns of which are combined in a highly ornamental manner. Those of our readers who are called upon to execute work of this character are likely to find both interest and value in the suggestive combinations of slate presented in the accompanying illustrations, even though they do represent designs of roofs covering buildings in England. The descriptive particulars which follow are from the pen of Whynn Steyne, and appeared with the rounded those, then light ones were placed outside the dark, and the main body of slates were dark also. Both colors were also shaped at certain parts. This shaping simply consisted of cutting off a corner of the slate here and there as the design required it; and, while interfering a little with the keeping out of the weather, the extent of interference is so very little that the appearance gained more than counterbalances the disadvantage. This example set the writer thinking how seldom it was that roofs, usually so dismal, dingy and ere the article is finished will be able to completely and fully substantiate this answer.

Since seeing the above example of ornamental slating, more than a year has elapsed before an opportunity has arisen for putting it on paper; and while nothing of the same kind has been observed anywhere in the course of the writer's wanderings here, there, and everywhere, other forms of ornament have been observed, and are now put on show in this article for the benefit of all whom it may concern.

The simplest and commonest deviation from an entirely plain slated roof is to have three or four courses of a different colored slate from that principally used. These form a long horizontal band, either light or dark, as the case may be, the whole length of the roof. In large roofs there may be two or three such bands, as in high-pitched church roofs.

The next most common variation is to have a horizontal band of slates shaped at the lower end, but of same color and size as the rest of the slates used. In Fig. 1 is given a general view of such a band, with the additional advantage of having all the shaped slates of a lighter color than the others. In Fig. 2 is given an enlarged sketch of one slate to show how each must be shaped. A shape or template should be prepared of tin, zinc, wood or any suitable material, and the slate cut away to that shape by means of the slate knife. This is not a difficult matter. The size of slate used is immaterial in this as well as the other illustations to be given, although, be it understood, it will be necessary sometimes to use narrower slates at certain places than the standard width. In this case of Fig. 1 all the shaped slates must be of one uniform width. Regarding length the size varies, as an extra course of slates has to be got into the space of four, so that a straight line of color may be obtained at top and bottom. If the ordinary courses be used the result will be as shown in Fig. 3. This is not objectionable at all, and as it is the easier way, it is more often executed both in one and in two colors of slates.

Other variations of color, with the same form of cutting for the slates, are given in Figs. 4, 5 and 6. The first of these three is most easily executed, but the other two will be more effective on the building. Care must be taken to mark off the centers of the design, and then the slates, being all the one width and laid from these marked centers, the design will work itself out all right.

Another form of cutting for the lower edge of the slate is shown in Fig. 7. In this case only the two corners are cut off and the appearance of the roof laid with such slates may be seen in sketch, Fig 8, where two courses of dark slates are laid between two courses of light ones, all treated as in Fig. 7 and laid between courses of ordinary dark slates. The three following Figs., 9, 10 and 11, are variations with the same shaped slate. In Fig. 12 is shown a curved edge on the lower end of the slate, and in Fig. 13 is given a sketch of its general appearance.

Figs. 14, 15 and 16 are all very bold treatments of colored slates, and to be effective should only be used in large roofs. The pattern, it need hardly be said, shown in Fig. 15, should be reversed at the opposite end of the roof.

A common and yet effective shape to cut the slate to is shown in our next illustration, Fig. 17, and its general appearance, Fig. 18, is, on the whole, very effective and highly ornamental, more so perhaps than any of the preceding shapes. Two additional methods of applying this shape are indicated in Figs. 19 and 20, the latter being perhaps the more pleasing. In it the reader may notice that the shaped slates are a considerable piece longer than the other slates used, and that there will be a stronger shadow cast down the side of the triangular portions.

A very slight variation of shape is ob-

DESIGNS IN SLATE ROOFING.

servable in Fig. 21, which, however, is very like the preceding examples; but in Fig. 22 is shown the most elaborate of these cut slates, and one that gives a very ornamental effect, as may be seen in Fig. 23. Such a slated roof looks exceedingly well, as the writer can personally testify. A few ordinary square slates inserted among these, as in Fig. 24, may be used to add variety.

At first sight Fig. 25 may seem rather a curious example of slating. It is, however, quite simple when it is analyzed. It consists of alternate courses of two of the shapes previously described, being Figs. 2 and 7. About as curious is the effect of Fig. 26, produced with exactly the same shapes, but with one shape cut out of larger slates than the other, and two courses of the larger slate to four courses of the smaller one. Another combination of shapes is shown in Fig. 27, formed with slates as in Figs. 2 and 12, while in Figs. 28 and 29 are given particulars of yet an-

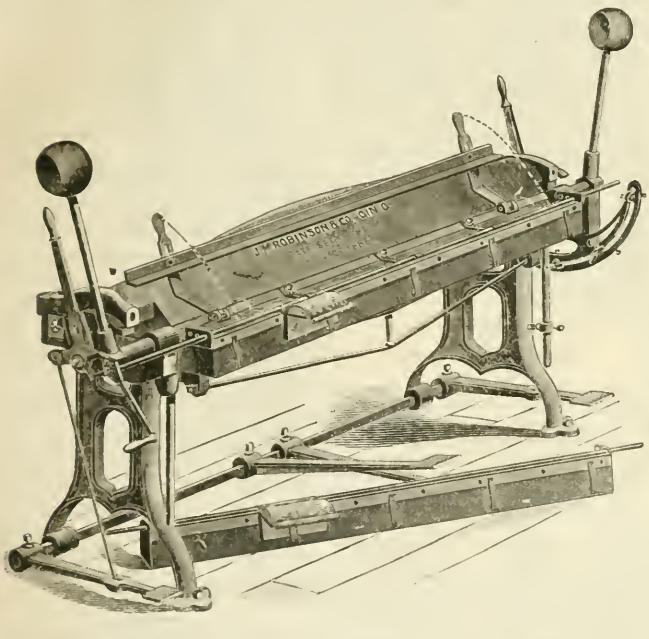
DESIGNS IN SLATE ROOFING.

other. A more ornamental arrangement is that shown in Fig. 30, with the corresponding diagrams in Figs. 7 and 22, and in Fig. 31, with its diagrams in Figs. 17 and 22. To finish up this section properly, as it were, in Fig. 32 is given a conglomeration of all these shapes together—one course of each.

This is more by way of experiment than otherwise, and it would scarcely be wise to carry out such a scheme, unless on some little odd house where quaintness and oddity prevailed throughout. In such a structure the style of slating would then be quite in keeping.

Cornice Brake, with Beader and Gutter Former Attachment.

In the accompanying illustration we present a general view of a cornice brake provided with beader and gutter former attachment, which has recently been placed upon the market by J. M. Robinson & Co. of 225 to 229 West Second street, Cincinnati, Ohio. The attachment



Cornice Brake with Beader and Gutter Former Attachment.

is secured to the bending bar of the brake and is so arranged that with one sweep of the gutter-forming bar the sheet is turned over the former the entire length with an evenness and economy of time which, it is claimed, cannot be obtained with the naked hands. The base, which is made of cast iron, runs the entire length of the bending face, and is secured to the bending bar by means of cap screws. There are three beading rods furnished with each machine, and in each is a groove running the entire length. The rods are journaled in each end of the base in holes suitably provided for each size of rod. The ends of the rods are square for the admission of cranks. There is secured to the top clamp of brake four beading rod clamps, which prevent the rod from springing while the bead is being formed. Secured to the front of the beading and gutter attachment by means of the cornice brake clamps is a wooden former of the proper size and shape required to produce the results sought. The gutter-forming bar is hinged to the base of the beader and gutter-forming attachment, thus permitting, it is claimed, a circular sweep of the gutter-forming bar, and by means of slots in the arms of the support the bar can be adjusted to a circular sweep suitable to the size of gutters being formed. The beader and gutter attachment is made in 4, 6 and 8 feet lengths.

Tarred Felt and Sheet-Lead Roofing.

A new sort of roofing has been patented in Germany and in several other countries which seems to have good qualities. The history of the invention, as related by the *American Architect*, is rather interesting. Herr Siebel of Dusseldorf remembering, what all architects know, that the best protection against damp arising from the ground into walls is a sheet of lead, and remembering also that on account of the great expense of a lead damp course of sufficient thickness to support the weight of the superstructure without tearing, it is quite common in these days to use as a substitute a sheet of tarred felt, conceived the idea that the advantages of both materials might be united by inclosing a thin sheet of lead between two thicknesses of tarred felt. In this way, while the inclosing felt protects the lead from being torn by the irregularities of the masonry and from corrosion by the lime of the mortar, the metal, although thin, interposes an impenetrable barrier against dampness, which is not liable, like the felt alone, to gradual decay. Moreover, the combined felt and lead is much cheaper than lead alone, of the thickness that it would be necessary to use, and, although patented, it is available, so far as cost is concerned, for buildings of very moderate pretension.

While engaged in perfecting this invention, it occurred to Herr Siebel that the felted lead would make a very impervious roof covering, and perhaps a durable one, and thorough tests seem to confirm this idea. The felted lead is sold in the same form as ordinary roofing felt, and applied in the same manner, receiving the usual protecting coating of tar and gravel on top; but the metal protects the felt under it so completely from the evaporation of the volatile portions of the tar, which is the principal cause of the deterioration of composition roofs, that it is said to remain tight for an indefinite period; and, even when the lead is exposed, from the decay of the felt over it, nothing is necessary but to lay over it new felt, with tar and gravel finish, to make the roof as good as ever, while an ordinary felt roof, which has once begun to rot, is not usually worth repairing. The practical man will think of other details, such as the facility with which flashings, gutters and zinc or copper edgings can be soldered to the lead of the roofing, which seem very much in favor of the new material, and it is to be hoped that it may come into use here. It is, however, difficult to roll very thin lead, and it is hard to understand how sheets, inclosed in felt, could be sold for roofing at a price to compete with a tin roof, which would be better in most respects.

Buckling of Tin Roofs.

From I. F. G., *Lebanon, Pa.*—Some time ago I noticed a question in *The Metal Worker* relative to the cause of buckling of tin on roofs. I would say on this subject that in my experience the cause has always been due to the putting of tin on sheathing boards that are not thoroughly seasoned or not entirely dry.

FLASHINGS.

Auld & Conger of Cleveland, Ohio, as the trade are doubtless aware, are the lessees of the Bangor Union Slate Quarry, located at Bangor, Pa., and which is said to be one of the largest quarries in that section. We are advised by them that the so-called Slatington Bangor Slate Syndicate has no control over any of their product, and they say it appears that a single quarry at Bangor has sold, or will sell, any of its production to the so-called syndicate. The firm named make this statement in justice to their customers and to correct any wrong impression that may exist relative to the control of the production of the Bangor quarries.

We are advised that I. N. Phillips, Nashville, Tenn., has just completed a contract for roofing the new shops of the Nashville, Chattanooga & St. Louis Railway in that city. The material used for this purpose comprised 40 cars of slate, with galvanized iron ridge rolls, gutter moldings, conductor pipe and tin lining in proportion. Mr. Phillips also undertook the supply of galvanized iron piping for heating these shops, amounting to 26,000 pounds of iron. He has now in hand a contract for the galvanized iron, tin and slate work for the Home for the Poor and the Asylum for the Insane of Davidson County, Tenn., the tin flue linings in which are nearly 3 miles long. The galvanized iron heating and ventilating pipes for these buildings are also included in the contract.

F. Vohringer, 517 Fifth street, Louisville, Ky., has been granted a patent for a device for painting the inside of tin and galvanized spouting and guttering, thus rendering it less liable to rust. This device is of a very ingenious nature and is claimed to fully meet the demand for something of the kind. Mr. Vohringer has placed his invention in the hands of tinners at various points and in each case it is reported as satisfactory.

Chas. H. Conner of Louisville, Ky., manufacturer of steel cap roofing, reports an active demand for the same, and also a very satisfactory year just closed.

The Wheeling Corrugating Company of Wheeling, W. Va., send us a pretty calendar for the first quarter of the new year. It is made up of three sheets

of cardboard, each carrying a photo-reproduction of a 6 x 8 section of steel ceiling. The printing is in colors upon tinted paper. Above the panel is the name and address of the company, while below is the calendar for the month. On the back of the sheets are the designs of stamped steel ceilings, together with directions for applying the same. For full information concerning these goods, the company refer those interested to their Ceiling Catalogue No. 170, which they state will be sent by mail to any address upon application.

Municipal Inconsistency on the Smoke Problem.

The importance of smoke prevention in large cities can hardly be overestimated, and it was due to this fact that an organized body of influential and public spirited citizens of Chicago was incorporated about a year since, with the sole object of waging a war of extermination on the smoke makers. The result of not more than nine months' systematic and determined enforcement of the city smoke ordinances is suggested in the following paragraph:

Smoke Inspector George of the city health department is at work upon his annual report. He expects to present it to Dr. Ware, city health commissioner, the last of the week. The report will make a showing as to the condition of the city in regard to smoke. In regard to railroads it will be shown that in the matter of smoke prevention their condition is 85 per cent. better than a year ago. Mr. George has compiled reports from every railroad giving the number of locomotives in use and the number equipped with smoke-preventing devices.

"An encouraging sign of the times," said Mr. George yesterday, "is that all the new buildings now in process of construction almost without exception are being equipped with smoke consumers. The railroads, too, are showing the utmost willingness to abate smoke and seem to be doing all in their power to do away with the nuisance. This shows that the public is getting hold of the idea that smoke can be abated and are desirous of taking the trouble necessary to that end.—*Chicago News Record.*

At the commencement of the crusade the public in general, and the "smoke breeders" in particular, were very skeptical as to the possibility of any really important degree of success being attained, and it was a popular belief that smoke-preventing devices were effective only when there was no fire in the furnace.

There can be no doubt that many of the proprietors of establishments whose chimneys were like young volcanoes would have been glad to avail themselves of any reasonable means of stopping their contributions to the objectionable cloud, and to this end a great deal of money has been spent on worthless devices until all further efforts were abandoned in disgust. Of course there was also a large number who took a purely selfish view of the matter and cared very little whether or not the community suffered from their smoke, their sole desire being to evade the provisions of the law so long as it was not rigidly enforced.

The function of the organization is not in any sense official—it merely exercises the right of any private citizen in calling attention of the executive branch of the city government to the continued infractions of the municipal laws, and demanding that the offenders be compelled to pay the penalty. The first batch of prosecutions—comprising a long list of manufacturers and steam users, many of whom are prominent business men—had the effect of opening the eyes of the public to the fact that the movement was in earnest, and that it behooved the offenders no longer to consider the law a dead letter. By employing a large corps of engineers, under a competent chief, the society was enabled not only to inspect the offending plants, but to suggest the necessary remedy; and the result has been, as indicated in Inspector George's report, that numerous efficient devices have been developed and applied. In most cases the prevention of smoke, instead of entailing an additional expense, is actually a source of economy, owing to the more perfect combustion of the fuel, and this fact once realized will be an important factor in the ultimate outcome of the movement.

There is, however, a striking anomaly in the situation. While the city government is, at short intervals, imposing fines upon long lists of violators of the smoke ordinance, the city itself is unquestionably the worst of the offenders. It is a fact patent to any observer that the chimneys of the public schools and other city institutions emit the densest clouds of the blackest smoke to be found within the corporate limits of Chicago, and have done so unmolested (apparently) during the entire period in which private citizens have been punished for the same offense, though committed in a lesser degree. There is neither consistency nor fair play in this. If a city official in an official report can state that the necessary means for smoke prevention are available and in use by private citizens and corporations, it logically follows that the same devices are available for the use of the city. It is rather a parody on justice for the lawmaker to punish the individual for violations of the law which itself violates. The nuisance of school-house chimneys is aggravated by the fact that they are situated, almost exclusively, in residence neighborhoods where one would naturally expect immunity from nuisances which might be considered excusable in a manufacturing district.

The Rights of Labor.

The labor troubles of the past year have probably excited more discussion of the relations between capital and labor than any previous occurrences of the kind. So much has been printed upon this subject that one would imagine the public thoroughly wearied and ready to say to employers and wage-earners "a plague o' both your houses." But this is not the case. The matter is of too important a nature to be dismissed. Until some effective plan is evolved for settling labor disputes men will continue to discuss the relations of capital and labor and to propound their theories upon the question of the rights of both parties. It is interesting to note that a change has taken place in the manner in which the rights of workingmen are regarded. The Homestead trouble was the occasion of a sudden outburst of rampant socialism from unexpected sources. For a time it seemed that the weight of public opinion was being exerted more and more strongly against individual property interests and in favor of the recognition of some sort of a right in mankind to other people's property. This doctrine was so manifestly absurd that public opinion soon corrected itself, and of late there has been a decided tendency among public speakers and writers to take the anti socialistic side of the discussion.

One of the most forcible, logical and thoroughly sensible contributions to this discussion is an address recently made before the Sunset Club by Z. S. Holbrook of Chicago and now issued in pamphlet form. Mr. Holbrook sets forth the circumstances surrounding the outbreak at Homestead in a calm, dispassionate manner, perfectly free from prejudice and then proceeds to define the rights of the company and their workmen without regard to any other considerations than those of natural rights as laid down by accepted authorities. He denounces demagogism as the underlying cause of the latter day mystification of the true relations of employers and employed. With caustic irony he thus sets forth the demagogic view:

Capital is denounced as a criminal acquisition. The successful merchant or manufacturer is the real criminal of to-day. The way to heaven is by the poorhouse. The hero is the tramp. Poverty has become a virtue. Muscular labor and not brain labor is the highest goal of manhood, and all such talk because the men who use their muscles cast a larger number of votes than those who use their brains.

He says wealth is not created by labor alone, and with almost brutal frankness adds that the province of labor is simply to change the form of matter; it is the province of capital to pay labor its wages for so doing, and then assume the risk and responsibility of changing the place and time of matter. "When wages have been paid all obligations of capital cease, except such as pertain to the domain of private conscience." Following up his course of reasoning to its logical result, it would be difficult to find a stronger presentation of the whole question of labor's rights than the following concise summary, with which he concludes:

1. Work is a blessing, not a curse.
2. The greatest philanthropist is he who furnishes employment to others.
3. Aggregations of capital are beneficial to society, as they reduce the cost of production.
4. Capital and labor are partners, but capitalists and laborers are not.
5. Labor must choose between the certainty of wages and the vicissitudes and risks of profit and less.
6. Having chosen wages as its part, when wages are paid the obligations of capital cease, except such as pertain to the domain of private conscience.
7. The obligations of capital to share profits with labor are no greater than those of others to share their surplus with the needy.
8. No man can show authority for dictating to capital its duty to labor when agreed wages have been paid.
9. Honesty, industry and thrift are the basic elements of wealth.
10. The capitalists of to-day were the wage-earners of yesterday, and the laborer of to-day can become the capitalist of to-morrow.
11. The mounds of property are dissipated by the sure laws of nature; hence the State does not need to assist in the work.
12. It is not a crime to acquire and to own. It may be a crime not to do so if one has the ability. Acquiring must not be confounded with avarice.

Finally, man has an inherent and inalienable right to labor, and this right must not be interfered with by unions or strikers. It is not the business of government to aid in the acquisition of money or to make property, but to protect every man, the humblest and the wealthiest, in his lawful efforts to acquire and enjoy the fruits of his labor.

The official report of the Mexican Secretary of the Treasury, giving the exportations from that country for the past fiscal year, has just been issued. It shows that the total value of the exports through the 40 custom houses of Mexico was $75,467,700. Of these exportations the precious metals reached the total value of $50,000,000. The exports of precious metals exceeded those of the preceding fiscal year by $13,000,000, while those of miscellaneous productions fell off $700,000. Tht exports were distributed among foreign nations as follows: Germany, $4,434,231; Belgium, $340,659; Colombia, $31,048; Costa Rica, $1050; Spain, $661,849; United States, $49,392 664; France, $4,644,385; Guatemala, $143,740; Holland, $19,997; Honduras, $4400; England, $15,267,455; Italy, $4732; Nicaragua, $10,914; Russia, $26,200; San Salvador, $3519; Venezuela, $3250. The exports to the United States aggregated $4,949,588 more than in the preceding fiscal year.

The Broadway Improvement Company will put up a fire-proof sky scraper near Fourteenth street for $600,000. The walls will have an iron and steel frame, which may be said to be the fashion in buildings of this description.

"The Metal Worker" Competition in Skylight Pattern Cutting.

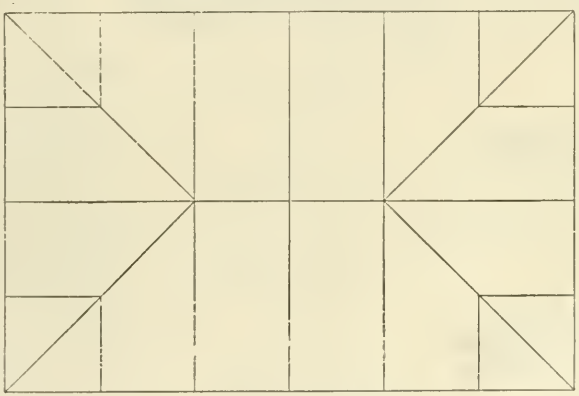
FOR the purpose of calling forth from the readers of *The Metal Worker* the best method for obtaining the patterns of a hipped sheet-metal skylight and to advance the art of pattern cutting, it has been decided to present a prize competition, the particulars of which are as follows :

Each contestant will be required to furnish the plans, elevations, necessary sections and profiles of skylight, also to design the various parts of same, giving to each part the shape that may be considered best adapted for the purpose ; drawings to be of such size as required for publication in *The Metal Worker*.

The skylight to be so constructed that the condensed moisture from below will be conveyed outside, the frame work of skylight to be made of sheet metal, and the usual thick glass to be used in connection with same ; the method of securing glass and caps to bars or rafters to be clearly shown.

While the plan may show a certain size of skylight, indicate the method by which one of similar pitch but different size can be constructed, the same miter patterns being used.

Show method of obtaining length of the various bars or rafters, using for the purpose any diagram, plan or elevation that may be necessary. Also show method of obtaining shape or section of hip bars.



Outline Plan of Skylight.

The skylight for which the patterns are required is such as would be placed over a light shaft, or on a roof or bulkhead, the size of opening being about 4 x 6 feet. As there is no particular rule governing the pitch of the skylight, it can be given such pitch as may be desired. While the wooden curb or frame of air shaft, roof or bulkhead is supposed to extend a sufficient distance above the roof to give ample opportunity for securing skylight to same, contestants will be at liberty to use such methods as appear best adapted for the purpose of fastening skylight, where brick and angle iron constitutes the frame.

The accompanying plan is not intended to give details of construction, but to indicate in a general way the shape of skylight for which drawings and patterns are required. Where there are two or more similar parts in the skylight, so that the pattern for one part will answer for the other, it will be only necessary to show details of one part. As indicated on plan, the skylight is to have a hipped roof, and as previously stated, the roof can be given any desired pitch.

PRIZES.

In the contest above described, two cash prizes are offered, as follows :

First prize.....$75.00.
Second prize..... 50.00.

The drawings and accompanying description may be sent by either mail or express, charges prepaid, and must reach the office of *The Metal Worker* not later than April 1, 1893.

They are to be addressed as follows :

THE METAL WORKER,
96–102 Reade street, New York.
(Skylight Competition.)

Each contestant is to select a fictitious name or device, which is to be placed on the description and each sheet of the drawings. The real name and address of the writer is to be put in a sealed envelope, on which is to be placed the fictitious name or device used on the drawings. This envelope is to be inclosed with the drawings and description.

The manuscript and drawings are to be sent flat, not rolled, and the writing should be on one side of the paper only. It is also suggested that legal cap paper be used for the description, the same size of paper for the drawings, and that ink be used for writing the descriptions ; the drawings to be either ink or pencil.

The various drawings and descriptions received up to the time set for closing the competition will be submitted to a committee selected for the purpose, who will decide between competitors.

In deciding between contestants, four points will be given consideration, as follows :

1. Originality.
2. Mechanical completeness of the method proposed.
3. Neatness of drawings submitted.
4. Clearness in description.

The right is reserved to publish all the drawings and descriptions received in this competition, and also to return to the authors the drawings and descriptions received in the competition in case they are not considered suitable for publication or worthy of an award of prizes.

TIN PLATES.

American Tin Plate Brands.—II.

In continuation of the list of brands and trade marks used by manufacturers of American tin and terne plates, printed in our last issue, we present herewith a second list, containing further informatian on this subject, which nearly covers the whole field. There are, however, still a few firms which remain to be mentioned. These we hope to give at an early date, as their communications had not reached us in time for inclusion in the present notice.

Apollo Iron & Steel Company,

Pittsburgh, P., are putting out one quality of American terne plates, the "APOLLO BEST ROOFING." Made in two sizes, 14 x 20 and 20 x 28; IC and IX. The plates are not stamped. Boxes of the smaller size are branded on one end with the name and trade-mark of the firm, as illustrated in Fig. 1, together with the gauge and size marks "IC" (or "IX") "14 x 20."

Fig. 1.—Apollo Iron & Steel Company's Trade-Mark.

Larger-sized boxes bear on the end the same trade-mark, *stenciled*, and "IC" (or "IX") "20 x 28" On the side of all boxes are branded, in 1½-inch letters, the words: "APOLLO IRON & STEEL CO., PITTSBURGH, PA."

Gummey, Spering & Co.,

Philadelphia, are making at the Continental Tin Plate Works, in that city, a considerable variety of brands of bright and roofing plates in standard sizes, IC and IX. The terne plates of the firm's production are heavily coated by palm oil process, and are known as follows:

1. "*Eagle.*"—Bright surface terne plates. Each sheet is stamped with name and gauge, together with the initials of the firm, as in Fig. 2.

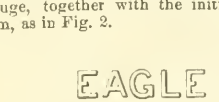


Fig. 2.—"Eagle" Stamp. Gummey, Spering & Company.

Boxes are marked on the end "IC" (or "IX") "EAGLE," while the sides are stamped "AMERICAN ROOFING" and "GUMMEY, SPERING & CO." respectively.

2. "*Liberty.*"—Also a bright surface, palm-oil process terne, stamped on each sheet as shown in Fig. 3. Box marks identical with those of "Eagle," substituting the brand name "LIBERTY" on the end of the box.

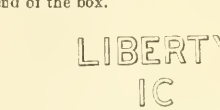

Fig. 3.—"Liberty" Stamp. Gummey, Spering & Company.

3. "*Phœnix.*" } Dark coated terne plates.
4. "*Climax.*" }

made by palm oil process. Sheets invariably stamped with brand name, thickness and initials of the firm. (See Figs. 4 and 5). Box marks similar to those previously detailed, excepting the brand name at the end of box.

Fig. 4.—"Phœnix" Stamp. Gummey, Spering & Company.

Fig. 5.—"Climax" Stamp. Gummey, Spering & Company.

5. "*Flag.*"—An additional brand just added. Marked similarly to above.

6. "*Alderly.*"—Superior roofing plate, resquared, and stamped with brand name. Boxes marked as above, with words "ALDERLY S IC" on the end.

7. "*Pennsyl Old Method.*"—A high-grade roofing plate, hitherto made by the firm abroad, is about to be produced at their American works under the same name.

Of American bright tin plates, Gummey, Spering & Co., are producing four varieties, in standard sizes, IC and IX—namely:

1. "*Phœnix.*"—Best charcoal, "Calland" grade.
2. "*Climax.*"—Best charcoal, "Melyn" grade.
3. "*Liberty.*"—Best charcoal, "Grange" grade.
4. "*Liberty.*"—Best coke plate.

Boxes are all marked on the end with brand, name and gauge, and bear on the side the name of the firm as in the case of roofing plates.

All qualities of plates carry on the box one or other of the company's registered trade marks, namely the "Eagle" or "Liberty Bell," as illustrated in Figs. 6 and 7.

Some of the other brands are about to be registered, but for the present, the "Phœnix" and "Eagle" are used in conjunction with the eagle trade-mark on the

Fig. 6.—Eagle Trade-Mark. Gummey, Spering & Company.

Fig. 7.—"Liberty Bell" Trade-Mark. Gummey, Spering & Company.

boxes, while "Liberty" and "Climax" plates alike bear the bell trade-mark.

St. Louis Stamping Company,

St. Louis, Mo., are turning out two brands of bright tin plates of IC and IX gauge, viz:

1. "*Granite.*"—A rolled plate, heavily coated, made in standard sizes, 14 x 20 and 20 x 28; 112 sheets to the box. The boxes are marked on the side with name of brand, as above, in conjunction with gauge and size. Each box also bears the words "AMERICAN TIN PLATE."

2. "*St. Louis.*"—A rolled plate of American soft steel, bearing a medium coating and finish, IC and IX; sizes, 14 x 20 and 20 x 28, 112 sheets to the box; also IC, 10 x 20, 225 sheets to the box. Box markings are similar to those of "Granite," excepting substitution of the brand name, as above.

In addition to those above noted, a variety of other sizes are made for exclusive use in the company's factory, in the manufacture of stamped and pieced tinware.

Three varieties of roofing plates of American soft steel are also produced by the St. Louis Stamping Company.

1. "*S. L. S. Old Process*"—A hand-dipped terne, made of 20 x 28 size. IC and IX. 112 sheets to the box. The boxes are marked on the end with name of brand, as above, one side being stenciled "OLD PROCESS HAND DIPPED," and the other bearing gauge and size and the words "TERNE S. L. S."

If desired, a guarantee of the amount of coating on these plates is given to purchasers.

2. "*Extra Fine*"—A rolled terne plate, IC and IX, 14 x 20 and 20 x 28. 112 sheets per box. Marked on box, "EX. FINE 20 X 28 TERNE IC" (or "IX").

3. "*S. G.*"—A rolled terne plate, 112 sheets to the box; made in one size, 20 x 28. IC and IX. Marked on boxes. "S. G." 20 x 28 TERNE. "IC" (or "IX"). All boxes bear the name "GRANITE MILLS."

No plates are stamped, and all brands are guaranteed to stand double seaming without breaking.

N. & G. Taylor Company,

Philadelphia, who possess unusually large manufacturing facilities, are turning out

the extensive line of American tin and terne plates detailed herewith:

Roofing Plates.

1. "*The Taylor Old Style.*"—A guaranteed brand. Manufactured in open pots by pure palm oil process. These plates are made IC, IX and XX, 14 x 20 and 20 x 28. The net weight of this brand is 120 pounds for IC 14 x 20, and 240 pounds for IC 20 x 28. Each sheet is resquared and stamped with name, registered trademark (an arrow and target) and thickness, as displayed in Fig. 8.

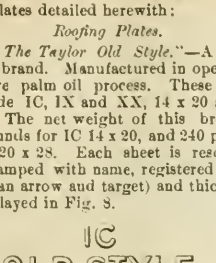

Fig. 8.—"Taylor Old Style" Stamp and Trade-Mark. N. & G. Taylor Company.

Boxes are strapped and marked as follows: On the front "OLD STYLE," with trade-mark and gauge; on the back the word "GUARANTEED," while one side bears the firm name, "N. & G. TAYLOR CO., PHILADELPHIA," and the opposite side bears the words "AMERICAN ROOFING TIN." This marking is uniform for all the brands of roofing plates made by the firm, except that the word "*guaranteed*" applies only to the three first qualities of terne, and is omitted for the lower grades.

2. "*The Taylor Roofing Tin.*"—Guaranteed; IC and IX, 14 x 20 and 20 x 28. Resquared and stamped on each sheet with registered trade mark and gauge, as shown in Fig. 9. Box marks are similar in every respect to those detailed above, except that the front bears the name of this brand.

Fig. 9.—"Taylor Roofing Tin" Stamp and Trade-Mark. N. & G. Taylor Company.

3. "*Columbia.*"—An extra coated plate, made from soft steel, made in standard

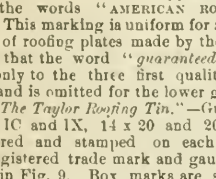

Fig. 10.—"Columbia" Stamp. N. & G. Taylor Company.

sizes, IC and IX. Each sheet is resquared and stamped with registered trade-mark—a shield; also gauge and name. (See Fig. 10.) Marks on boxes similar to those for "Old Style," with the exception of the brand name and trade-mark on the front.

4 "*Maple.*"—Thoroughly coated and well finished; made from soft steel; IC and IX, 14 x 20 and 20 x 28. Sheets re-squared and stamped, with registered trade-mark, displaying brand name and gauge, "IC" or "IX." (See Fig. 11.) Boxes are stamped on one end "MAPLE IC" (or "IX"). Side marks are the same as those of other roofing plates of this firm.

Fig. 11.—"Maple" Stamp and Trade-Mark. N. & G. Taylor Company.

5. "*Willow.*"—A well-coated plate, made from soft steel, resquared; sheets are unstamped, made in sizes 14 x 20 and 20 x 28, IC. Box marks similar to the foregoing brands, substituting the words "WILLOW IC" for brand name on front.

6. "*Knoxall.*"—A registered brand; medium coated plate; made in standard sizes and gauges. Unstamped sheets. Boxes are marked on sides as the other. One end bears name "KNOXALL" and gauge.

7. "*Globe.*"—A well-finished plate, in standard sizes. Sheets unstamped. Boxes marked on the end "GLOBE IC." Side marks similar to those of other roofing plates.

In addition, Messrs. Taylor & Co., manufacture seven brands of Bright Tin Plates of various qualities, viz:

1. "*Brilliant.*"—An extra fine quality, richly coated plate, adapted for high-grade work. Sheets are separately wrapped in tissue paper.

2. "*Royal.*"—A high grade, choicely finished plate for fine work.

3. "*Merion.*"—Well finished, and stated to be a standard quality for first-class wear.

4. "*Linden.*"—Well coated; for good wear.

5. "*Almond.*"—Good ordinary finish; made of soft steel, and intended for every purpose requiring toughness and ductility.

6. "*Mint.*"—Good steel plate of fair finish, suited for all ordinary purposes.

7. "*Locust.*"—Taggers tin of all gauges and kinds.

Boxes are all marked with firm name and address on the side and bear the name of brand stamped in plain letters as above on one end.

United States Iron and Tin Plate Mfg. Company,

Demmler, Pa: The product of this concern includes two grades of bright tin plates, made in standard sizes, 14 x 20 and 20 x 28, with special sizes to order. The gauges are IC, IX, IXX, IXXX, IXXXX and IXXXXX.

1. "*U. S. Bright.*"—A palm-oil process plate, carrying 6 pounds of tin to

Fig. 12.—U. S. Iron & Tin Plate Mfg. Company's Trade-Mark.

the box. These plates are made of extra fine quality American steel, guaranteed to do any kind of seaming. The weights per box are as follows:

14 x 20, IC, 108 pounds.
20 x 28, IC, 216 pounds.
14 x 20, IX, 136 pounds.
20 x 28, IX, 272 pounds.
14 x 20, IXX, 156 pounds.
20 x 28, IXX, 312 pounds.

Each box is stamped with name of brand as above, and also bears on the lid the company's trade-mark and firm name, as in Fig. 12.

2. "*Youghiogheny*" is a bright tin plate which has lately been added, similar in all points to "U. S. Bright," except that it bears 3 pounds less coating per box. Box marks are similar, with the exception of brand name, as above.

Three grades of terne plates are also made in standard sizes, as follows:

1. "*U. S. Eagle.*"—A heavily coated roofing plate, bearing 13 pounds coating per box. The weights per box are:

IC, 14 x 20, 115 pounds.
IC, 20 x 28, 230 pounds.
IX, 14 x 20, 140 pounds.
IX, 20 x 28, 280 pounds.

Each sheet is guaranteed, squared, and stamped as in Fig 13.

Fig. 13.—"U. S. Eagle" Stamp. U. S. Iron & Tin Plate Mfg. Company.

The box also bears the name of brand, with gauge and quality, in addition to trade mark and firm name on lid.

2. "*U. S. Redipped.*"—A very heavily coated plate, carrying about 18 pounds per box. Redipped by hand. Boxes weigh as follows:

IC, 14 x 20, 120 pounds.
IC, 20 x 28, 240 pounds.
IX, 14 x 20, 145 pounds.
IX, 20 x 28, 290 pounds.

Boxes bear on the side a brand "U S. REDIPPED," with other markings similar to those given for "Eagle" brand Each sheet is guaranteed, squared, and stamped as in Fig. 14.

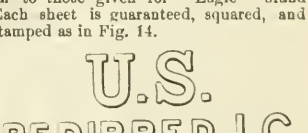

Fig. 14.—"U. S. Redipped" Stamp. U. S. Iron & Tin Plate Mfg. Company.

3. "*U. S. Monongahela*"—Lightly coated plate, 6 pounds to the box. These sheets are coated by oil process, the only one used at the works. Weights of boxes are given as:

IC, 14 x 20, 108 pounds.
IC, 20 x 28, 216 pounds.
IX, 14 x 20, 136 pounds.
IX, 20 x 28, 272 pounds.

Box marks identical with those of former brands, with the exception of

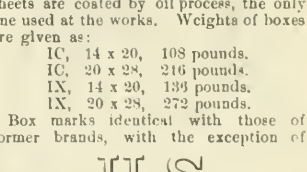

Fig. 15.—"U. S. Monongahela" Stamp. U. S. Iron & Tin Plate Mfg. Company.

brand name, which is placed on the side, as above. Each sheet is squared, and stamped as in Fig. 15.

House Warming.—II.

Broadly, the subject may be considered from two distinct standpoints; first, that of efficiency, which is the adequate production and diffusion of the supply of heat; and, second, economy, or the relation between the existing cost and possible value of the means employed. The former, of ceurse, is the more important, as we must keep warm enough (if we can) regardless of the necessary cost. But, as a purely business proposition, it behooves us to see also that the cost is no more than is necessary. Considered in an abstract sense the comparative efficiency of a heating apparatus is its capacity for delivering, in available manner, the largest possible quantity of the heat generated from the fuel at its most economical rate of combustion. It is, however, the relative efficiency which is the important consideration—that is, its capacity for furnishing the quantity of heat required by the conditions attendant on its location.

For instance, we would say of a stove which was capable of throwing out an unusual quantity of heat on a small consumption of fuel, that it was a very efficient one. And so it would undoubtedly be. But if the same stove were required to comfortably heat a room twice as large as it was capable of doing, the room would not be sufficiently warmed, and we would say it was due to the inefficient heating apparatus, which would not, in any sense, imply that the stove was not a good one, but merely that it was inefficient by reason of the size of the room. Thia is one of the mistakes most commonly made. The heating apparatus, be it stove, hot-air furnace, steam or hot-water boiler, is made of a capacity insufficient for the requirements, and the result is that the fire is forced to a wasteful degree and the rooms are uncomfortable notwithstanding.

CAPACITY OF HEATERS.

It is, of course, a somewhat difficult matter to adapt the capacity of the heater to the exact requirements of its location. The large majority of householders are merely tenants, and as such are more or less given to "moviog." With each change of location there is likely to be a change in the conditions affecting the portable heating facilities, so that the stove which was of ample capacity for the previous requirements becomes totally inefficient in the new quarters. This is to a great extent an unavoidable difficulty to which the migratory class is subject. But it may be rendered much less serious by averaging the conditions between the probable extremes, and, in purchasing a stove, selecting one of sufficient capacity to economically meet the average requirements. Of course people who own their own homes, or those who seldom change their location, may have exactly what is needed, no more and no less, the capacity being made sufficient to easily meet the extreme conditions of the permanent location, thereby placing the medium and minimum requirements under perfect control, as a mere matter of regulation. Stoves may be considered as about the only class of heating apparatus which is strictly portable. Although the majority of modern hot-air furnaces are of the so-called portable class, and being self contained, may be moved as often as desired with the same facility as a stove of equal size, yet they are almost universally considered as permanent items of the house fixtures, and may, therefore, be adapted to the exact requirements of their location. Steam and hot-water apparatus and open grates belong to the permanent class of heaters, and are subject to the same conditions in regard to capacity as the hot-air furnaces.

But whatever be the form of apparatus employed, it is simply the means of transmitting the heat generated by the combustion of ordinary fuels, and whether it is by direct radiation and contact of air; circulation of steam or hot water through pipes and coils, or other form of "radiator," or by conveying a volume of hot air by means of pipes and flues from the furnace to points of utilization—it may be considered broadly as a comparison of the means with the end, wherein the fuel (principally, though not entirely, on the basis of cost) represents the former, and the quantity of heat delivered in available manner the latter.

HEATING VALUE OF FUELS.

Therefore, in order to consider intelligently the comparative efficiency of the several systems of heating, one with an other, and also all, with the theoretical possibilities, we must first ascertain what these possibilities may be. And, to do this, we must ascertain first the heating value of different fuels, according to their chemical analysis; and, second, their relative consumption of air necessary for combustion. The latter involves the effect of combustion on the ventilation, and *per contra*, of the ventilation on combustion, for, as previously stated, the two are interdependent. This, of course, refers only to cases in which the combustion takes place at the point of utilization of the heat, as in case of stoves and open fire places. But the same relation between the heating (independent of combustion) and ventilation exists where the combustion takes place in some location separate from the point of utilization. Also must be considered the fact that the ventilation necessary for health and comfort is, in many cases, far in excess of the requirements of combustion, and that in such instances there is an additional duty imposed on the heating apparatus in raising and maintaining the temperature of the increased volume of fresh air continually entering, while the corresponding quantity is expelled, with its contained heat derived from the heater.

We must, therefore, investigate the requirements of the sanitary phase of the subject; not simply as a matter of sanitation, but with reference to its effect on the heating as well. In the systematic and thorough consideration of such a complex subject, we will naturally perceive defects and conceive remedies therefor more readily than would be possible when our investigations, even though equally extensive, lacked consecutive progression. Consequently, it may be that some suggestions of more or less value can be derived from the examination of the subject now in hand.

Let us now ascertain the theoretical heating, or, to use the technical term, calorific, value of our fuel, and compare it with the amount utilized by the best modern practice. The principal combustible elements found in all fuels are carbon and hydrogen. While there are some others—sulphur, for instance—they are seldom in proportions sufficiently large that they need be taken into account as to their effect on the total calorific value of the fuel, except, of course, for purely scientific purposes, when it is necessary to be theoretically exact in all calculations. As to their chemical and physical effects, outside of the mere matter of heat, they may or may not need to be considered, dependent entirely on circumstances governing their relative importance. There have been many exhaustive experiments by eminent authorities to determine the exact heat-producing powers of the combustible elements. The formulated results of the investigations of Dulong, Pouillet, Regnault, Dalton, Joule, Péclet, Favre and Silberman and many others* agree so closely as to demonstrate their accuracy beyond question. At the risk of repetition in going over well-trodden ground it may be desirable to go into some little detail in order to have the possibly familiar facts before us as we progress.

ANTHRACITE COAL.

As anthracite coal is by far the most extensively used of all fuels for domestic purposes, we will now see the possible value of an average grade according to its analysis, first mentioning that the constitutents of 1 pound of pure anthracite are:

	Per cent.
Carbon	90 to 94
Hydrogen	1 to 3
Oxygen	1 to 3
Ashes	3 to 4
Water	1 to 2

From the exhaustive report of the Geological Survey of Pennsylvania we take the following analysis of anthracite coal from the Lehigh district:

	Per cent.
Fixed carbon	92.07
Volatile matter	5.03
Earthy matter	2.90
Total	100

Specific gravity 1.57. Heat units 14,221.

To ascertain the calorific value of 1 pound of this coal, we must first see the individual values of its several constituents, which according to Favre and Silbermann, are as follows:

Hydrogen	62,032 heat units.
Carbon	14,544 "

It will be noticed that in the first analysis there is a small percentage of oxygen, the effect of which, in a fuel containing hydrogen, is that the available quantity of the latter is reduced by reason of the direct combination of a portion of it with the oxygen in the production of water, without any useful calorific effect. The combining proportions of the two elements being eight of oxygen to one of hydrogen, the net, or available, quantity of the latter will be the given quantity less one-eighth, by weight, of the oxygen present, or hydrogen $= H - \frac{O}{8}$. For example, the analysis gives 1 to 3 per cent. of both hydrogen and oxygen, and we may assume the quantities of the two to be equal, say 2 per cent. of each. We then have $2 - \frac{2}{8} = 1.75$ per cent. of available hydrogen. In the second analysis we have neither hydrogen nor oxygen, but an item of 5.03 per cent. of volatile matter, the composition of which has not been determined. This is usually composed of one or more of the compounds of hydrogen and carbon, which have different calorific values, according to the proportions of each. Oxygen, nitrogen and sulphur being present will, of course, also be accounted for as volatile matter. In anthracite coals the percentage is usually small and need not be given in detail for determining the calorific value. In bituminous and semi-bituminous coals, however, the percentage is so large that its value can only be properly calculated from its complete analysis. In the present instance it will be noted that the heat value is given as 14,221 thermal units, and from this we may ascertain the value of the volatile matter by simply deducting that of the known quantities—carbon only, in this case—which gives:

	Heat units.
Carbon 92.07 per cent. × 14,544 heat units per pound	13,390.7
Total given	14,221.0
Leaving for volatile matter	93.03

* Numerous references are made to Barr's "Combustion of Coal," which contains much valuable information on the subject of fuels.

CANNEL COAL

As we will have occasion to refer later to different bituminous coals, as well as charcoal, coke and wood, we may dispose of the question of their several calorific values in the present connection, making reference to them as we progress in consideration of the subject. Cannel coal, which is a hard variety of bituminous, though not unlike anthracite in appearance, is of totally different composition, being very rich in hydrogen and correspondingly less rich in free carbon. Of several analyses of this coal from Pennsylvania, Indiana and Kentucky, given in detail by Mr. Barr in his "Combustion of Coal," we select as an average the following by Prof. E. T. Cox, the sample being from the mines of the Buckeye Cannel Coal Company, Davis County, Indiana.

	Per cent.
Carbon	71.10
Hydrogen	6.06
Oxygen	12.74
Nitrogen	1.45
Sulphur	1.00
Ash	7.65
Total	100

The available hydrogen, $6.06 - \frac{12.74}{8} =$

Calorific value.

4.47 % × 62,032 = 2,772.8 heat units.
Carbon, 71.10 × 14,544 = 10,340.8 "

Total heat units per pound of coal.....13,113.6

Weekly Prize Competitions.

$25.00.

FOR MORE than six months Weekly Prize Competitions ($10) have been an interesting and useful feature of the *Pharmaceutical Record*, a journal issued from this office and devoted to the interests of the drug trade. These weekly competitions have related to a variety of technical and business questions of interest to druggists, and have brought out a large amount of information of much service to the readers of that enterprising journal. In view of the success of this feature we have decided to announce a similar series of Weekly Prize Competitions on questions of interest to our readers, and invite a general participation on the part of the trade. As the object of these competitions is to obtain information which will be of practical service to our readers, and to discuss questions in which they are interested, we shall esteem it a special favor if any in the trade will suggest subjects for such competitions, which, if deemed suitable, we shall take pleasure in using.

In each competition there will be three prizes—a first prize of $12.50, a second prize of $7.50 and a third prize of $5. The prizes will be awarded for the answers which in the judgment of the committee of award are most suitable for publication and of the most general interest. These competitions are open to every one, and it is hoped that there will be a general response from business men. Those intending to compete are reminded that it will not be necessary to write long essays, but that comparatively brief and business-like answers to the different questions will be favorably regarded as meeting the purpose for which these competitions are announced. We shall have the privilege of publishing any or all of the contributions received.

Weekly Prize Competition No. 4.

SUBJECT:

Suggestions as to Improvements in Putting up Goods.

A good deal of attention has been given by manufacturers to the matter of putting up goods, and there has been a great advance in the attractiveness and convenience of packages. There is, however, an opportunity for further improvement, and the object of this competition is to call out suggestions as to how manufacturers can still further meet the wants of the trade in this regard. This subject touches upon the following points, as well as others which will occur to our readers:

The advantage to the retailer of convenient and attractive packages.

Goods which suffer from the way in which they are put up.

Goods which are not put in boxes, but should be.

Improvements in the kind or style of boxes.

Whether packages are of convenient form or size in view of the quantity of goods contained, or shelf or other requirements.

Improvements which might be made in labels as to color, form, prominence of size or number, &c., with samples of desirable labels.

Whether it is desirable for labels to provide a place for marking the cost or selling price.

Whether directions for use are suitably given in connection with goods which require them.

Shortage in count or weight.

The following prizes will be awarded:

First prize	$12.50
Second prize	7.50
Third prize	5.00

Replies are to be received not later than February 25, 1893. They should be addressed as follows:

DAVID WILLIAMS,
96–102 *Reade street,*
New York.
Weekly Prize Competition No. 4.

The Weekly Prize Competitions noted below are now before our readers and remain open until the dates named:

No. 1. Closing February 4.
How to Avoid the Accumulation of Dead Stock.

No. 2. Closing February 11.
How to Keep the Store Neat and Clean.

No. 3. Closing February 18.
Waste in the Store and How to Avoid It.

No. 4. Closing February 25.
Suggestions as to Improvements in Putting up Goods.

Another subject will be announced in our next issue.

Our readers are also reminded of the following Prize Competitions, announced on another page, in each of which four prizes, of $50, $25, $15 and $10, are awarded:

No. 6. Closing February 18.
How Retailers Can Best Advertise and Extend Their Business.

No. 7. Closing February 18.
Travelers' Yarns.

No. 8. Closing February 18.
How to Treat Clerks.

No. 9. Closing February 18.
Shop System of Keeping Track of Jobs.

No. 10. Closing February 18.
Business Maxims—At Least 10.

No. 11. Closing February 18.
How Small Retailers May Keep a Record o Prices.

News and Notes.

Several organizations of machinists East and West are endeavoring to make universal a rule requiring four years' apprenticeship before anybody can be recognized as a competent workman.

Glass manufacturers in Pennsylvania find that they cannot depend on natural gas fuel and are adopting coal. The Findlay field is also said to be exhausted. Crude oil as a substitute is too expensive.

Thirty ships were loaded at San Francisco for New York last year, instead of about a dozen per annum, as heretofore.

Over 500,000 lizard skins were imported from Mexico last year for conversion into card cases, pocket books, purses and such articles.

Twelve leading locomotive works in this country built 1703 locomotives in 1892, against 1968 in 1891. Forty-eight of the principal car factories turned out 93,393 freight cars last year.

Horace Smith, of the firm of Smith & Wesson, in his will leaves for objects of charity one-half of his estate, which is estimated at $1,000,000.

Governor-General Stanley of Canada, in opening Parliament, stated that the completion of the canal works at Sault Ste. Marie is being hastened to make Canadian commerce independent of any other route.

Five lighthouses on the coast were destroyed in the recent storms, and the damage to lights and buoys is estimated at $1,000,000.

In the Hawaiian Islands there are 40,000 contract laborers who could not be "annexed" to the United States under existing laws.

What is known as the Arnot case, on trial at Williamsport, Pa., to test the legality of the Reading combine was decided by the Lycoming County court in favor of the defendants. It will be appealed.

The College of the City of New York proposes to erect a new building which will cost not less than $575,000.

President Howell says he expects before long that electricity will take the place of the cable on the bridge railroad.

The Commissioner of Navigation estimates that about $200,000,000 a year is now being paid by Americans to the owners of foreign marine tonnage.

The Boston Heating Company have just realized 10 per cent. on their stock, being the first and the last dividend to be derived from their investment.

Cotton planters are preparing for another convention, to be held next spring, to restrict production.

The Hawaiian Kingdom seeks closer relations with the United States, and the Legislature proposes a royal commisson who shall proceed to Washington to obtain information as to terms upon which more satisfactory relations can be established between the two countries.

STOVE TRADE NOTES.

Changed Conditions in the Stove Trade.—V.

By Stovemaker.

The principle of protecting the retail dealer is just and right, but when a class of purchasers break away almost in a body from one source of supply and seek another it is folly on the one hand to try and hold them back, or on the other to refuse to let them in. When the movement is one as well defined as that proved in an incredibly short time to be, individual adherence to former lines in the hope of thwarting it is business suicide. As well might the clerks refuse their salary because of such freaks as the bosses refuse the trade.

And yet while the best policy for any concern lies in looking new issues squarely in the face and going with the tide of demand, it is nevertheless a fact that such changes work injury to the trade during the transferring process that rob profits for a long time.

The very nature of the changes which the trade has undergone during the last ten years has made it difficult for wholesalers to preserve prices and profits. The desideratum has been to get all the customers possible among new buyers to equal sales to the old, and as many more as might be accomplished. The field, which before was limited and portioned out, as it were, each one having its special territory or customers, became open to everybody and with fewer preferences, so that the concern established 50 or 60 years found their goods no longer enjoying the high rating bestowed on them by old buyers, and the obscure founder jumped to a position of equal footing. To maintain the hold upon the trade and suffer no curtailment of output, prices have been subordinated in hopes that after getting the customers something would happen to warrant an advance.

DECLINE IN PRICES.

Thus it is that in this department of the stove business there has been a decline in prices of at least 20 per cent. in excess of the decline due to natural causes that have taken place in all the other departments, and ranges for flats are furnished to the builder all set up complete for less than the ranges alone were sold for ten years ago. The loss is felt more keenly because every such range set diminishes the demand and lessens the stove trade of the future. The local demand in family cook stoves and ranges is suffering to-day from the lengthened life of the ranges that have been set stationary during the past ten years. Had the same number of portable stoves been used instead, many of them would have been replaced ere this. The difference in the longevity of the two constructions is not due to the difference in the wear and tear from use, but to the destruction from accidents in moving to which the portable stove is subject and the set range is not. The family cook stove that suffers a broken top or bottom through the recklessness of furniture movers is sold to the junk dealer and a new one bought, but the set range remains intact from year to year, and has only to be supplied with new fire linings occasionally to make it serviceable.

The greater risk attached to selling stoves to builders increases the expense for investigating their responsibility, and the percentage of bad accounts is proportionately increased. The high value of such property precludes the possibility of protecting the claim by bidding in the property at a foreclosure sale when the builder fails, and such a thing as a surplus over the mortgages to pay off unprotected creditors is rarely known, so that the failure of the builder means to the stove man a total loss of his bill.

HEATING STOVES.

The cook stove trade is scarcely more affected now by the modern flat construction than the parlor and heating stove business. The front parlors in such flats are now warmed by heat from furnaces or by fire-place Franklin heaters, built in, and the necessity for buying a small heating stove for such rooms is no more. The trade in portable cooking and heating stoves is nowadays practically confined to the lower section of the city below Fifty-ninth street and mainly below Thirty-fourth street, and even in this section it is constantly being reduced as old dwelling houses are torn down, and the new style of tenement erected on the site. In a smaller degree the trade in Brooklyn, Jersey City, Newark, and all surrounding towns is affected by the same cause, and no house with any pretension at all is now built that does not contain a stationary range for cooking, and either a furnace or fire place heater for heating purposes. Old houses that are overhauled and remodeled are furnished in the same manner, and the stove man will shortly find it unnecessary to call at some of these old familiar houses except for repairs, when formerly the frequent change of tenants required his presence and services there often either to deliver a new stove, set up an old one or furnish pipe, fire board or something of the kind.

Stoves will never be driven out of use altogether, but the tendency of the present time is to relegate them to the rear as much as possible. Devices are constantly being made to save people the trouble of making and taking care of several fires in different parts of the house, to save the expense and damage in moving them about, to spare them the labor of putting up, taking down, blacking, fitting and renewing pipe, carting ashes and the danger of fire, and thousands of appliances for burning oil, gas and vapor for heating and cooking have been introduced, and apparatus for heating by hot water and both cooking and heating by steam are extensively adopted, all hastening the retirement of the stove.

REMEDIES FOR THE TROUBLE.

After the diagnosis of the diseases from which the stove trade is shown to be suffering the question is, what remedies shall be prescribed?

How can the ruinous rebates, deductions and concessions to the furniture dealers be eliminated forever as an element in the trade or prices be adjusted to cover them? Can any one house or any dozen houses by the adoption of a conservative policy hope to increase profits to themselves or accomplish the result for all? No, in the present condition of the trade those not joining in the reform movement would hail the opportunity of taking custom from the others, and through their lack of steadfastness the dealers would fly from one manufacturer to another at any attempt to raise prices or abolish concessions that were not general.

How can the repair trade be wrested back from the control of the repair dealers? Can the feeble efforts of individual concerns or a local association expect to do it? No, it will take the determined efforts of a powerful corporation with back bone to sink thousands of capital before the traffic can be rooted out.

How can the merciless and foolish competition in the flat range business be suppressed?—competition that scales down the profit on every successive order taken. There is not a manufacturer hereabouts who caters to that trade and expects to remain a factor in it, no matter how high the repute of his range, who can get a dollar or two more for it than his neighbor with a poorer one who cuts the price.

Who is simple-minded enough to think that one concern can alter the course of business by setting an example to all the others? How long before he would be compelled to shut down his foundries if he let each customer go who demanded a reduction in price to meet another quotation? How can all the New York City men combined expect to change the conditions with Pennsylvania at her door dumping surplus stocks at cut prices which the Pennsylvania Association gives its members the privilege of doing?

A negative reply to the above questions is the only one appropriate, but a very natural conclusion would be, and the reader might well ask, if the conditions of the Eastern trade are as stated, why manufacturers do not come together and with one accord abolish all the concessions which have operated to rob them of just profits? Why they do not resolve that from a certain date the blacking of stoves shall be charged for at a certain price, that stoves in certain quantities will be delivered free of cartage, and when smaller numbers are ordered which must be sent by express, the charges to be collected; that the consignee shall be responsible for all breakages occurring in transit when goods are not delivered by the wholesaler's trucks; that charge will be made for examining a stove put up by a dealer, &c.

POSITION OF LOCAL MANUFACTURERS.

"It is never too late to mend," and it may be admitted among the possibilities of the future that they will do so, but so far as the New York manufacturers are concerned, the time seems very remote. There have been any number of meetings and dinners within the last five or six years among the New York men, and the idea has been broached and some exchange of views and debate upon the subject has occured, but it has been confined to a certain few who have set themselves the task of agitating the matter and endeavored to work up a general sentiment in favor of the reform. Their efforts have always proved abortive and to-day there is no sign visible pointing to such a probability.

A feeling of distrust has permeated the New York wholesale trade for a long time and it sometimes seems it will never die. There can be no doubt that every

firm would be glad to own allegiance to an association whose influence was adding to its profits no less than all others interested in it, but there are too many who refuse to believe that such a result is possible, to help in forming one.

The reason why this disbelief exists is very plain and very natural, and is owing to the unparalleled concessions such an association would be expected to eradicate. They have been so far reaching, so overreaching and so abundant, and the manufacturers have struggled so hard to outstrip each other to find some new concessions to attract customers that they cannot believe there is such a thing as mutual forgiveness for them.

In times past when the allowing of an extra 2 or 5 or maybe 10 per cent., or otherwise cutting prices, worked against profits and made some agreement advisable to adjust matters, the way to a satisfactory understanding was never very hard; but such a condition was a bagatelle compared to the present, and the war that has been waging for so long a time makes it probable that peace will not come till failures call loudly for a cessation of hostilities.

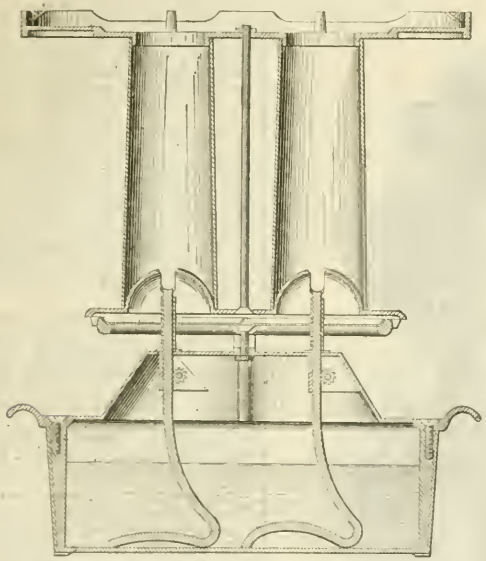
THE END IS NEAR.

The war ought to be over now. The furniture dealers are now about all in. The few remaining who do not sell stoves are all on record as opposed to selling them, and urging by salesmen will not serve to change their determination. The repair business has gone over to the pirates all it ever can, and the builders of flat houses have more or less settled down to using certain ranges—the concessions made by each house to get new customers, and the loss sustained ought to be sufficient to deter all from making any more. But if any agreement upon the matter is impossible, if the formation of an association and the appointment of committees to correct abuses, whose recommendations will be abided by, is out of the question, and if the individual houses continue to be so over-anxious for trade that the methods of the late past and present must be continued with all that that implies, then there can be little question that the only plan to turn back profits into the coffers of the stove manufacturers of New York would be the one considered by so many as oppressive or unjust, and yet which has in so many cases proved a source of profit to those interested, a cheapening of the commodity produced and a benefit to all the people—namely, a trust.

There is reason to believe that while they would hesitate to enter into any other sort of combination, a union of interests such as this would be agreeable. There are those in the city who are known to be strongly in favor of this plan, and who urge its adoption, and there are many listeners to this arrangement among those who laugh at any other.

The Safety Oil Stove.

A new candidate for public favor in the line of oil stoves has just been placed upon the market by the Safety Oil Stove Company of 142 Kneeland street, Boston, Mass. The stove is made with an oil tank constituting the base, this being formed of metal, the top fitting snugly upon and bolted securely to the side walls by means of bolts or screws, as indicated in the sectional view, Fig. 1. There are also provided projecting ears, which form convenient handles for lifting the stove. On the top plate is formed an elevated dome having elongated slots through it for the passage of the wicks, all as indicated in the sectional engraving. Instead of placing the wick raisers within an enlargement of the wick tubes above the dome, as is often the case, they are mounted within the dome. The star wheels on the spindles engage the wick, pressing it against the internal wall or depending flange extending downward at one edge of the wick slot, thus raising or lowering the wick as desired. A good idea of the construction of the wick tube and wick raisers may be gathered from an inspection of Fig. 2 of the illustrations. Above the dome is a skeleton rack having short legs resting on the top, to which it is secured by one or more bolts. The upper frame of the stove consists of several plates between, and to which the chimneys are firmly secured. The cone plate has the usual elongated cones within which the wick tube rises, and around which the base of the chimney snugly fits. It also has a single upright post, to which the front plate is held by a single screw. On top of the chimneys is a skeleton plate for the reception of kettles or articles to rest upon when being heated. The front of the stove is somewhat peculiar, the front plate being an open or skeleton casting, having windows opening into the chimneys at their edges. The sheet metal of which the chimneys are made is cut and turned back against the sides of the openings through the front plate, in order to afford full passage of the light from the burning wick. The openings are closed by a swinging door, consisting of two laterally jointed plates having openings through them corresponding to the windows in the front plate and the apertures in the chimney edges. The construction is such that the top may be readily detached from the base when necessary to trim the wicks, while the latter may be lighted by simply opening the door at the front. We understand that the company are making preparations to place a large number of stoves upon the market at an early date.



The Safety Oil Stove.—Fig. 1.—Vertical Cross Section of the Store.

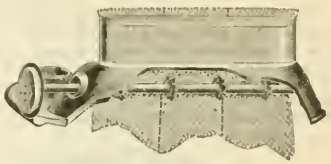


Fig. 2.—Wick Tube and Raiser.

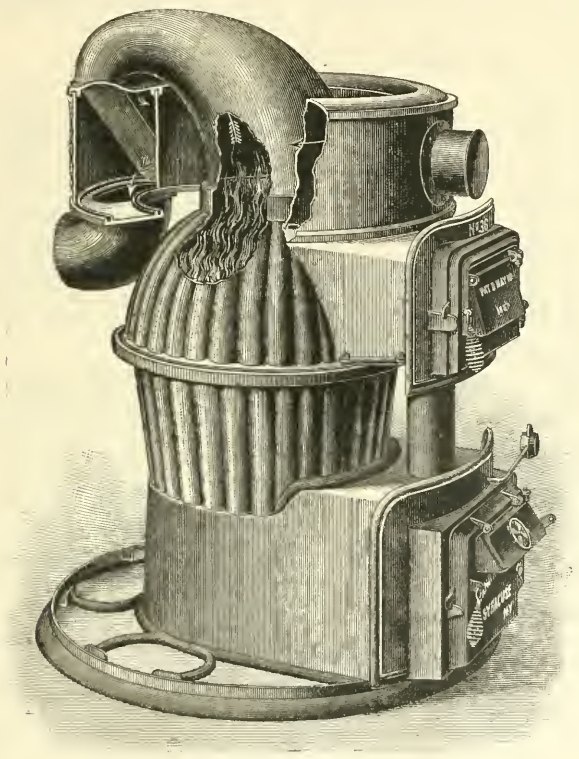
THE BECKWITH MEMORIAL THEATER, reference to which was made in these columns some weeks since, was dedicated at Dowagiac, Mich., on the evening of Wednesday, January 25. The dedicatory address was made by Col. Robert G. Ingersoll, who took for his theme the life of Shakespeare. A large audience was present, including visitors from Detroit, Kalamazoo, Chicago, Niles, South Bend, Lansing, Edwardsburg, Hartford and other places. The Memorial Theater was opened on Friday, January 20, with Mlle. Hortense Rhea in "Much Ado About Nothing." The building is 85 x 115 feet in size and three stories high. The first story is a magnificent arcade of four arches, with 20 feet to each span. The piers are rock-faced and on each is a portrait. The top story front consists of semi-circular headed arches, there being carved bands extending across the piers and bosses to the label moldings. Upon the bay directly over the main entrance is a large medallion portrait of the late P. D. Beckwith, beneath which is a carved panel bearing the name "Beckwith." In the other front bays are portraits in medallion of personages famous in poetry, music and the drama.

ONE OF THE NEATEST advertising novelties which we have seen this year comes from the Art Stove Company of Detroit, Mich. It is a handy little case, of pocket size, which the company are sending out to their customers and to the trade generally. Attached to what may be called the second page of the cover is a little book for carrying postage stamps. It is made of paper prepared for the purpose, and is of a size sufficient to contain in each space eight stamps, with the printed sides together. Attached to the other cover is a folded calendar for the year 1893 and a flat pin cushion. The case is held together by means of an elastic band. Upon the front cover is the name and address of the company, a *fac simile* of their trade-mark

and the words "Laurel stoves and ranges." On the back cover is a picture of the Laurel oil heater. We understand that the Art Stove Company have now ready for the market the new six-hole Home Laurel range, which has been in process of construction for some time past, and to which reference has already been made. They also have ready for the season of 1893 a small oil heater called the Art Laurel Junior.

The Howard Single Radiator Furnace.

The Howard Furnace Company, Syracuse, N. Y., have added to their line a new style of heater, and have just placed it upon the market. This heater, which is illustrated in broken view in the accompanying cut, is constructed to meet the growing demand existing in some localities for a reliable heater of moderate price. We understand that the apparatus is constructed from new patterns made directly under the company's supervision at their own works. It embraces the downward draft principle, which is claimed by the Howard Furnace Company to be so successfully applied in their other heaters. Among the distinguishing features of this new furnace may be noted the large fire pot, increased grate surface and combustion chamber that terminates at its cone-shaped apex in a return flue that is carried over and into the top of a large ring radiator that entirely encircles the upper portion of the heater. The heat is taken around this radiator and thence downward by means of a simple arrangement of dampers into the smoke pipe to the chimney. All these features are clearly shown in the broken view of the furnace printed herewith. The "low down" feature, which is regarded by so many as very desirable, is included in this latest style of furnace. The material and workmanship used in the construction of these heaters, we are informed, are adapted to produce a well finished product. We learn from the manufacturers that this series of furnaces have been subjected to severe trial tests with most satisfactory results. The heater is made in six sizes with fire pot from 18 to 30 inches in diameter, and hight from 50 to 68 inches, and the radiator and all other parts of the furnace are so constructed as to be easily and thoroughly cleaned. The company will continue to manufacture their standard heater, which will be sold as their leading furnace.



The Howard Single Radiator Furnace.

ODD PLATES.

SOUTHARD, ROBERTSON & Co., corner of Water street and Peck slip, New York City, have the following salesmen engaged for the present year: Hilan Seabury will look after the interests of the concern in New York State and the East, while William M. Bray and A. F. Bohn will continue to call upon the trade in New York City and vicinity. We understand that they have already booked a number of gratifying orders for the Columbus ranges, which, with the Wren, Pansy and New Rocket, make a very popular line of low-price goods.

WARREN FOUNDRY COMPANY, Warren, R. I., begin and end their list of traveling salesmen with the name of their general manager, S. H. Peirce, who keeps their stock of Woodlawn stoves and ranges in a gratifying state of hard pan. Mr. Peirce has had much experience with the trade and is known as a thorough all-round stove man.

THE LEHMANDT & MCDOWELL STOVE COMPANY of Philadelphia, Pa., have adopted a neat method of advertising their well-known cook stove known as the "Farmer Girl." The scheme consists of incorporating in the upper left-hand corner of the letterheads of their agents a bird's-eye view of the company's works, below which is the inscription, "This is where the celebrated Farmer Girl cook stove is made—over 500,000 now in daily use." At the extreme right is a circular panel carrying a picture of the cook stove and beneath it the inscription, "The Best in the World."

THE CORTLAND HOWE VENTILATING STOVE COMPANY of Cortland, N. Y., have been advised by Secretary Bicknell of the Massachusetts Charitable Mechanics' Association that they won a gold medal for ventilating stoves shown at the eighteenth triennial exhibition held by the association, at Boston, last October and November.

THE LEBANON STOVE WORKS of Lebanon, Pa., have engaged George Moe to represent them during the next 11 months in Southeastern Pennsylvania, New Jersey, Delaware and the Southern States, and Stephen Light of Lebanon, to canvass the stove trade in Western Pennsylvania, Western Virginia and Western Maryland.

TAUNTON IRON WORKS COMPANY, Taunton, Mass., have recently completed a building 160 x 50, three stories high, which is to be used as an addition to their mounting room and for storage purposes. The offices of the company will also be located in this building, and we are advised that they are very handsomely fitted up. This concern has abandoned its Boston headquarters and now transacts all business at Taunton.

THE FULLER & WARREN COMPANY of Troy, N. Y., have chosen as trustees Walter P. Warren, Charles W. Tillinghast, John Hobart Warren, Gurdon G. Wolfe, Walter Thompson and William Henry Warren. The trustees elected the following officers: President, Walter P. Warren; vice-president, Gurdon G. Wolfe; treasurer, Joseph Mackey; secretary, Robert S. Wood.

THE STUART & PETERSON COMPANY of Philadelphia, Pa., favor us with a copy of a catalogue which they have just issued from the press relative to their leading lines of manufacture. Among the furnaces and ranges we note the Snowflake, made in several sizes; the Fulton, a neat range embodying the modern features; the Favorite, a member of the same general class, and the Madeline. There are also shown several varieties of charcoal furnaces, together with an extensive assortment of enameled, tinned, bright and plain hollow ware, griddles, waffle irons, coffee and peanut roasters, evaporating dishes, steam jacketed kettles, cuspidors, caldrons, &c. The volume is made up of nearly 80 pages and is bound in paper covers. The company also give attention to ice cream storage cans, refrigerator tanks, &c.

THE TRAVELING SALESMEN who will represent the Gibson-Love Mfg. Company of Chattanooga, Tenn., during the present year are M. M. Price, who will cover middle and Southern Georgia, South Carolina and Northern Alabama; W. W. Axley, who will travel in Eastern Tennessee and middle Tennessee, Virginia, Kentucky and North Carolina; J. B. Marsh in Southern Alabama, Mississippi, Louisiana and Florida, and H. H. Jones, who will look after the interests of the company in Chattanooga and immediate vicinity.

THE LINES OF UNIVERSAL STOVES which Cribben, Sexton & Co. of Chicago, Ill., are supplying to the trade are meeting with a very gratifying reception, if one may judge from the letters which are being received by the concern. In their mail

last week was a letter from a customer in West Pullman, Ill., who wrote that the only comfortable house in that place this winter is heated by a Brilliant Universal parlor stove. Five rooms, a hall and stairway were all thrown open, and notwithstanding the fact that during the recent cold snap the thermometer went down to 20° below zero, the stove did its work with entire satisfaction. The wife of the customer considers it the best investment he ever made.

THE MICHIGAN STOVE COMPANY, Detroit, Mich., are putting up a new warehouse building, which will be devoted exclusively to the storage of castings and supplies. It covers an area 156 x 50 feet in size, and is being constructed of brick with a stone foundation.

W. H. PAISLEY looks after the interests of the Paisley Stove Company of Beaver Falls, Pa., traveling through Southern and Western Ohio, Western Pennsylvania, Northern Illinois and Indiana.

THE PHILLIPS & CLARK STOVE COMPANY of Geneva, N. Y., have engaged H. R Chambers to look after their interests in New England and Eastern New York; J. T. Chase in Central New York and Pennsylvania, and R. R Woodcock in Western New York and Ohio.

WE LEARN from E. H. Gilman, treasurer of the Somersworth Machine Company of Dover, N. H., that they will be represented on the road this year by George F. Drew, whose route includes Massachusetts, Rhode Island, Connecticut and the lower section of Vermont; J. H. Moore, who will cover Vermont, New Hampshire and Maine, while M. D. Bingham will look after the local trade.

CHARLES E. COLEMAN, representing Eugene Munsell & Co. of 218 Water street, New York City, is now visiting his many friends in the trade through New York State, Western Connecticut and Massachusetts. Although the thermometer during the recent cold snap registered between 18° and 31° below zero at Elmira, Bridgewater and other Central New York towns, orders for spring and summer goods were plentiful, owing to the fact that the average stove dealer received no little encouragement by reason of his disposal of fall stock of parlor heaters. Mr. Coleman is of the opinion that the present season has been the best for many years. He reports a gratifying demand for the company's specialties, all of which, as our readers know, bear the familiar name "Manhattan."

THE BUCK'S STOVE & RANGE COMPANY of St. Louis, Mo., have recently filled an order for one of their Buck's Brilliant base burners, which was shipped to Ireland.

AMONG THE ORDERS which have been filled by the Peninsular Stove Company of Detroit, Mich., may be mentioned one for a three-gang or triple combination Peninsular wrought steel range for the new union depot in Detroit. We understand that this range is the subject of considerable comment by reason of its handsome appearance and satisfactory operation.

RANDELL & WARD of Le Roy, N. Y., are mailing to their friends in the trade a postal card, upon the back of which are illustrations of their steel lock frame stove truck, one view showing the device ready for use, while the other shows it closed for storing or shipment. We understand that this is a new truck, and that the manufacturers will be in a position to make shipments very soon.

THE BAXTER STOVE COMPANY of Mansfield, Ohio, are making strong claims for their line of Monarch vapor stoves, which, for the season of 1893, possess features likely to attract the attention of dealers generally, and especially those handling vapor stoves. The company have agents in many of the principal cities of the country, and are in a position to promptly meet the demands which may be made upon them.

THE ST PAUL STOVE WORKS, St. Paul, Minn., have made an arrangement with the Laura Nevins Range & Heating Company of that city to manufacture some of the latter company's ranges with the understanding that if the plan proves successful the manufacture will be continued on some basis to be hereafter agreed upon.

AT THE ANNUAL MEETING of the Syracuse Stove Works, held in Syracuse on Wednesday, January 25, J. Emory Eaton was elected president; Fred. J. Fincke, vice-president; Francis Kernan, treasurer; Nicholson E. Devereux, secretary, and William H. Landers superintendent. We are informed that last year was a very prosperous one, showing a healthy increase in business and that orders for 1893 are coming in much better than they did during the corresponding months of 1892. The company look forward to a large volume of trade.

THE RICHMOND STOVE COMPANY of Norwich, Conn., have a staff of traveling salesmen who will look after their interests during the ensuing year, consisting of B. E Mallory, who will cover Southern New England; Norman Whitelaw and Frank W. Whitelaw, who will travel in Eastern New England; Thomas J. Douglas, who will look after the company's trade in Western New England, Eastern Pennsylvania, and along the Hudson River, and Theodore C. Perry, who will travel in the West.

THE SIMONDS MFG. COMPANY, 50 Cliff street, New York, send us an illustrated pamphlet showing Culver's new tubular furnace with upright or round radiator in brick chamber, also with jointless upright radiator, tubular portable furnaces, Montana furnaces for brick setting and also in portable form, steel dome furnaces for coal or wood especially designed for Western trade, and new school house heaters.

C. TERHUNE will represent the interests of Bowie & Terhune of Rome, Ga., during 1893 in the States of Alabama, Mississippi and Louisiana, while E. H. Whitehead will cover Georgia and North and South Carolina.

THE TRAVELING REPRESENTATIVES of the Syracuse Stove Works, Syracuse, N. Y include Col. R. Doggett, who will visit the trade in Central New York; C. H. Ingham in Eastern New York and Vermont; C. B. Hill in Eastern New York and Ohio, and E. A. Wilbur in Ohio, Indiana and Michigan. The Chicago representatives of the company are W. J. McKay & Co., while their Baltimore interests are looked after by Charles C. Heath & Co.

WE HAVE RECEIVED from the Schneider & Trenkamp Company, Cleveland, Ohio, a copy of an attractive catalogue of Reliable gas stoves. It is neatly printed on a good quality of paper and is bound in colored covers with a side title in old gold. A feature of the opening pages are *fac similes* of medals which were awarded the company for their display of goods at the Convention of the Western Pennsylvania Exposition Society held in Pittsburgh last year. There are also given a number of testimonials, following which is a table showing the cost of cooking by coal as compared with gas. The Reliable ranges are shown in great variety, attention being directed to the principal features of construction, the sizes in which they are made, the number of burners employed, the weight when ready for shipment and the price. The engravings are of a character to show the stoves to advantage, and the volume as a whole is likely to prove interesting and valuable to the trade. The line of gas heaters shown is a very attractive one and includes gas grates as well as round and cabinet heaters. A telegraphic code occupies one of the pages.

THE SOUTHERN STOVE WORKS COMPANY of Richmond, Va., will be represented on the road this year by E. T. McCabe and C. H. Fleming, who will cover Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida and a portion of Tennessee.

A. WEISKITTEL & SON of Baltimore, Md., have recently registered in the Patent Office at Washington, two trade-marks constituting the words "Golden Rule" and "Fire King." The former name is applied to a new and complete line of attractive ranges which the company have brought out in three sizes and the usual modifications. The name of Fire King is especially applied to the manufacturers' line of gas stoves, gas ranges, ovens, &c. We understand that they have greatly increased their facilities in the production of gas goods and have made many improvements in this line, besides adding a new cheap gas range, together with a complete line of nickel-treated hot plates. Messrs. Weiskittel & Son have a complete catalogue of gas-burning appliances in process of preparation and it is expected to be ready for distribution among the trade in a very short time.

THE QUAKERTOWN STOVE WORKS of Quakertown, Pa, are operated by the firm of Roberts, Winner & Co., all the members of which are practical men, each having charge of some department of the works. William P. Roberts supervises the operations of the mounting room and attends to the shipping and receiving of goods; O. R. Scheetz is secretary and tressurer, and Frank Cavanaugh is foremen of the foundry. William P. Winner represents the interests of the company on the road, covering Eastern Pennsylvania and Western New York. Charles A. Klump travels in Northern New Jersey, the New England states and New York City, while the Philadelphia sales agency, in charge of Faith, Belson & Co. of 207 Market street, looks after the trade in central and Southern New Jersey and the territory south of Quakertown.

GEORGE M. CLARK & CO. of Chicago, Ill., have taken possession of the building 153-155 Superior street, in order to secure additional facilities for their rapidly increasing business. The new structure covers an area 50 x 150 feet in size and is five stories and basement in hight. It adjoins their old quarters and makes the entire building now occupied 125 x 130 feet in area and five stories and basement in hight. The company also occupy an additional floor at 161 Superior street. The business is of a gratifying volume and the company are shipping large quantities of stoves to all parts of the country. They report the general outlook for the year as very promising.

DURING THE YEAR E. A. Davis will travel in the interests of the Plymouth Foundry Company of Plymouth, Mass.

DURING 1892 the Hanging Rock Stove Company of Ironton, Ohio, melted 1135 tons of pig iron and turned out 8000 stoves and ranges. The Foster Stove Company at the same place melted 1300 tons of pig iron during the year.

JOHN EWIG of Philadelphia, Pa., has patented a moistening attachment for hot-air registers, which has a tray into which partially dips a deflector. The latter has its ends raised above the front and rear walls, while the side walls are cut away. A valve at the rear end of the deflector

controls the vapor from the fluid receiving pan. The inner end of the deflector extends to the rear of the pan so as to overhang the hot-air flue.

A GAS COOKING APPARATUS having a gas tight chamber and means for producing gas therein forms the basis of a patent recently granted to John Ruthven of Topeka, Kan. Hinged to the case containing the gas chamber is a swinging cooking and heating attachment and forming when closed a part of the case. The attachment has a swinging burner plate, drip plate and support, together with burner pipes and burners. Means is also provided for measuring the gas which enters the gas chamber.

RICHARD L. BALL of Terre Haute, Ind., has patented a base heating stove in which the combustion chamber is at the front and a smoke pipe leading upward from the rear portion of the stove. From the upper part of the combustion chamber there are smoke passages leading into the rear portion of the stove and connecting with a hollow radiator at the top. The radiator has a central receptacle which is open at the front. Between the radiator and the smoke pipe is a passage or flue controlled by a damper. The air pipes, which extend upward through the main body of the stove, are open at both ends and arranged to discharge through the top and into the receptacle of the radiator.

GEORGE T. MOE of Philadelphia, Pa., is the patentee of a furnace which is provided with a radiator above, through which the products of combustion are compelled to take a circuitous course before entering the smoke pipe. By means of the construction employed, it is claimed, a large amount of radiating surface is provided at comparatively low cost.

THE CLEVELAND FOUNDRY COMPANY, Cleveland, Ohio, are turning out a fine assortment of lamp stoves, which they are offering to the trade under such names as Puritan, Chief and Triumph. These are attractive constructions, and are made with one, two and three burners. The company have issued a catalogue for 1893, in which these goods are illustrated and their merits fully set forth.

W. J. MCKAY & CO., of 51 and 53 South May street, Chicago, Ill., are sending to their customers in the stove trade a catalogue of 48 pages showing the various specialties which they handle as jobbers. The volume is profusely illustrated, is printed in tinted ink and bound in colored paper covers. One of the first things to catch the eye of the reader is the statement that their territory for the goods manufactured by the Favorite Range & Stove Company and by the Eclipse Stove Company is confined to Cook County, Ill. The goods shown include numerous specialties of the concerns named as well as those of other manufacturers.

RATHBONE, SARD & CO. of Albany, N. Y., have made a number of improvements in their line of vapor stoves for the present season, and their travelers are now on the road with cuts and prices of their new goods. The Tropic, which has been on the market for something like over ten years, is referred to as being simple and durable in construction and perfectly safe in operation. The company do not make any "new process" or "evaporating" stoves, as we understand they have more confidence in the hot generating principle. They have three size of low junior stoves 14 inches high, and two sizes of high juniors 24 inches high. These, we are informed, are new patterns and far ahead of anything they brought out last season.

THE IRWIN MFG. COMPANY of Louisville, Ky., have been appointed sales agents in Indiana, Illinois and the South for the Monarch gasoline and gas stoves, made by the Baxter Stove Company, Mansfield, Ohio. The Irwin Company have recently finished an addition to their foundry, 50 x 30 feet in size and two stories in hight. It is to be used as a pattern shop and finishing room, and was rendered necessary by a very gratifying increase in business.

S. M HOWE'S COMPANY, Boston, Mass., who have been appointed exclusive agents for the sale of the Quick Meal gasoline and gas stoves in the New England States, report a very satisfactory trade, and have placed their second carload order for these well-known stoves. It would appear from this that the prejudice long existing in that locality against gasoline stoves is dying out.

WALKER & PRATT MFG. COMPANY, whose warerooms at 31 to 35 Union street, Boston, Mass., were damaged by fire on the morning of January 25, have located a temporary office at 93 Union street and 164 Blackstone street and are doing business as usual and making shipments regularly. The fire was confined principally to the upper floors and rear, and the front part of the building and lower floors were more damaged by water than by fire. Their offices escaped with a wetting down, and will soon be ready for occupancy. The total loss is stated at about $50,000, covered by insurance. The work of rebuilding has already begun and will be pushed forward as rapidly as possible. Meantime shipments will be made direct from their factory, which is located in the suburbs, and a little or no delay may be anticipated.

THE ADDITION which the Michigan Stove Company are making to their works has rendered it necessary to cut down the old "Pontiac Tree," which for so many years has stood upon their property. Ever since June 2, 1886, the tree has existed only as a stump, and during the past year the lifeless trunk has borne the image of an Indian, cast in stove metal, and "resplendent with the gaudy colors with which the warlike son of the forest was wont to bedeck himself." Last week the image was removed from its lofty pedestal and the axe applied to the roots of the stump, thus demolishing the last vestige of the battle of Bloody Bridge, which occurred early on the morning of July 31, 1763. It is said that ever since the land upon which the tree stood was acquired by the company named innumerable Indian relics have been taken from the earth, in which its roots were imbedded. The tree itself was found to be riddled with bullets, many of which are now in the possession of the officers of the company.

PLYMOUTH FOUNDRY COMPANY, Plymouth, Mass., have recently opened a salesroom at 90 Union street, Boston, in charge of George Beckett. A full line of their Royal stoves and ranges, and samples of their other stoves will be carried.

THE CHICAGO STOVE & RANGE COMPANY will hereafter be the name by which the recently formed Chicago stove company will be known and under which they will transact business. The new name was adopted because the first one selected was too much like the Chicago Stove Works, and might therefore cause some confusion. The company's quarters have just been removed from 41 State street to 45 and 47 Lake street, Chicago, where they have an elegant sample room and enjoy greatly increased shipping facilities. The members of the company are Willis H Steele and J. E. Fitzgerald. Mr. Steele has had long experience in mercantile business and Mr. Fitzgerald has been a stove salesman for a number of years, being particularly acquainted among the city trade of Chicago. They are wholesale dealers in stoves, ranges, &c., but directly represent the Abram Cox Stove Company, the North Dighton Co-operative Stove Company, the Indiana Steel Range Company and the Gurney Refrigerator Company. They will also handle gasoline stoves.

WE REGRET to learn that on the 25th ult. fire broke out at 11 p m. on the third floor of the factory of the Milwaukee Gas Stove Company, at Milwaukee, Wis. The firemen succeeded in confining the flames to the gas stove company's plant, but were unable to save it. The loss is about $35,000; insurance, $30,000. The great Milwaukee fire a few months since burned within half a block of the company's building, but although spared at that time they were evidently only reserved for misfortune later. We presume they will reestablish their business in new quarters.

RATHBONE, SARD & CO., Wabash avenue and Randolph street, Chicago, will issue their catalogue of vapor stoves in the course of a couple of weeks. They have decided, after very careful consideration of the subject, to continue the manufacture of their thoroughly-tried Tropic single-generator stove and not to take up the new process. They have been manufacturing the Tropic for ten years, and in all that time have had so little complaint from their customers that they have concluded not to change. The vapor stove trade has already opened with them in such good shape that they look forward to an excellent vapor stove season. In coal and wood goods they have brought out some new styles of cook stoves, which are now being offered to the trade by their traveling salesmen, all of whom are out and are doing well, even better than expected. Several carload orders have already been received, which is something rather unusual so early in the year. The Beech Acorn wood cook is one of their new stoves. The reservoir style is made with flush top instead of the usual elevated top. The oven is larger at the top than usual, the fire box being placed forward some distance and slightly overhanging the front of the stove The design throughout is very handsome, the panel work being particularly fine. It is made in six sizes and eighteen varieties. The Iron Acorn is a first-class soft coal cook, of large size, which was brought out last year, proved to be very popular, and is now made with flush top reservoir. The oven in this range is unusually capacious, and is so shaped that every part of it is available. The Regal Acorn, a first class wood cook, has been brought out in a new dress. The Acorn calendar, which has been regularly issued by this company for a number of years, appears for 1893 in much more handsome form than ever We have received specimens with gold and silver backs.

The entire baggage, transfer and coach system along the line of the Central Railroad from New York to Niagara Falls has been purchased by a syndicate with a capital stock of $1,500,000.

A strike at the Brooks Locomotive Works in Dunkirk has become so serious that a regiment of troops was called for to protect the men who remain inside the works. The riveters in the boiler department refused to work under the contractors, alleging inhuman treatment.

Naval officers strenuously oppose the introduction of cellulose on ships of war to prevent the ingress of water following the penetration of a missile, on the ground that it harbors vermin and would deteriorate in the tropics. It is suggested that the spaces for it would be filled at the navy yard when the ship is preparing for action.

PRIZE COMPETITIONS.

WE HEREBY ANNOUNCE a series of six prize competitions relating to trade matters in which our readers are interested. Four prizes of $50, $25, $15 and $10 will be awarded in each competition.

The competitions are open to all and a general participation on the part of the trade is invited.

We shall have the privilege of publishing any or all of the contributions received.

The committee of award in assigning prizes will take into account the merit of the different contributions and their suitability for publication.

PRIZE COMPETITION No. 6.

How Retailers Can Best Advertise and Extend Their Business.

The object of this competition is to obtain practical suggestions as to the methods which the retail dealer in Hardware, Stoves, Tinware, &c., can advantageously adopt in building up his business, and is intended to cover such points as the following:

Advertising in the local papers, with suggestions as to how such advertising should be done and to what extent;
The manner in which circulars and other printed matter may be used;
A description of any special or unusual methods of attracting and holding trade; and
General suggestions in regard to ways in which the business can be extended.

An account of any methods which have been found useful in building up trade will be suitable under this competition.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 6.

PRIZE COMPETITION No. 7.

Travelers' Yarns.

The traveling salesman is proverbially happy in the stories which he narrates, and this competition is for the purpose of calling out a collection of good yarns for publication. While the attention of travelers is specially invited to this competition, it is open to all. Stories relating more or less closely to trade or business matters will be preferred.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams 96–102 Reade street, New York, and marked Prize Competition No. 7.

PRIZE COMPETITION No. 8.

How to Treat Clerks.

Under this competition, beside a general discussion of the subject, such questions as the following may be considered:

The extent to which clerks should be given an opportunity of obtaining a knowledge of the business, and of price-lists, prices, &c.;
Whether it is desirable to have formal rules for the regulation of employees and for the management of the store. If so, a set of rules should be submitted;
To what extent clerks should be held responsible for their mistakes;
Suggestions as to how clerks should be treated in order to secure their most intelligent and efficient work;
Mistakes made in the treatment of clerks.

This competition opens an important subject and it is hoped that it will be discussed fully by merchants and by their clerks from their different points of view.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 8.

PRIZE COMPETITION No. 9.

Shop System of Keeping Track of Jobs.

This competition is intended to call out information in regard to methods of keeping account of the cost of labor and material on tin-shop work, repairing and new work, inside and outside. In connection with the general subject such points as the following may be touched upon:

Whether blanks or forms are used in connection with such work. (If so, samples should be submitted);
What record is kept of orders, costs of jobs, charges, &c.;
How time occupied in going to and from the job is covered;
Suggestions in regard to the profitable conduct of the shop.

To illustrate the system it is desirable that a specific job (as for example, repairing down spouting and eave trough, or other job of repairing in which new material is used) be referred to and the method of keeping track of the costs in such job fully explained.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 9.

PRIZE COMPETITION No. 10.

Business Maxims—At Least 10.

Those entering this competition will send at least ten maxims relating to the conduct of business, presenting in a brief and pithy manner practical suggestions which may advantageously be followed.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 10.

PRIZE COMPETITION No. 11.

How Small Retailers May Keep a Record of Prices.

The object of this competition is to call out information or suggestions in regard to the best methods to be adopted in keeping a record of prices, showing cost or selling prices, or both cost and selling prices, of Hardware, Stoves, Tinware, &c., in a small retail store employing not more than four persons in the selling and bookkeeping departments, including the proprietors. Those entering the competition are expected to give a concise and clear explanation of their system, and if a price book is used, to submit as illustrating the system at least three specimen pages. If a price book is referred to it may be of any design or arrangement best adapted to the purpose, and may be original with the contributor or may be one of the different price books on the market. Fictitious names should be used instead of the real names of jobbers and manufacturers.

The committee in awarding prizes will take into account the merit of the different systems described, the character of the descriptions given, and the general utility and interest of the contribution.

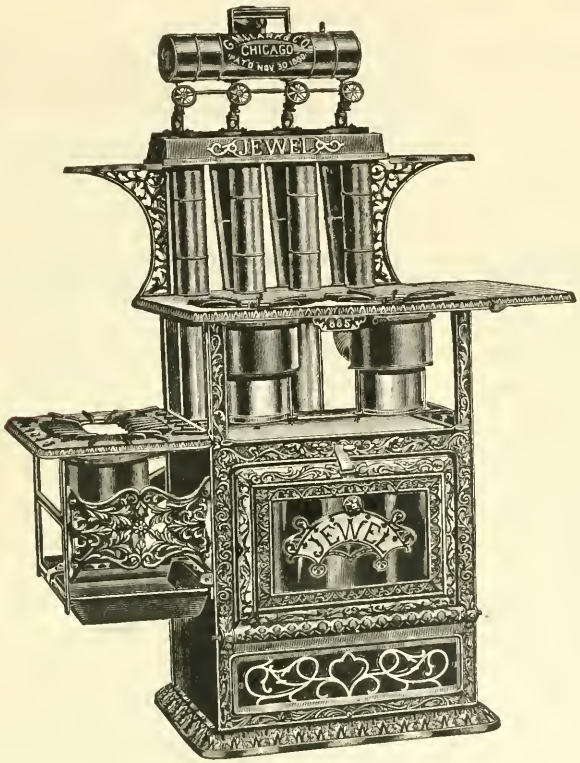
First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business, February 18, 1893.

Contributions should be addressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 11.

Jewel Process Range.

In the accompanying illustration we present a general view of the Jewel Process Cabinet Range for 1893, which is being offered the trade by George M. Clark & Co. of Chicago, Ill. The construction is referred to by the makers as possessing those features which are essential to satisfactory operation and as being decorated in a very attractive style. The frame of the range is made of cast iron, while the body is of cold rolled sheet steel finished with japan. Drip pans are provided under all the burners, the burner for the oven being entirely inclosed within that chamber. The arrangement of parts is such, it is claimed, that all the heat is utilized for baking purposes before it is allowed to escape to the chimney. The oven, which measures 17¼ x 14 x 12 inches, has a drop door and spring balance, it being constructed exactly on the principle of the Jewel portable ovens; that is, direct heat with a rear connection for the chimney. The top measures 23¾ x 22¼ inches, and the hight from the floor is 35¼ inches. The small top surface is 26 inches from the floor, and measures 13¼ x 19¾ inches in superficial area. The upper shelves of the stove are 46¾ inches from the floor, while the end shelf is 7¼ x 19¾ inches in area. There are two burners in the top surface of the stove, one on the step at the side and one in the oven. The stove is referred to by the manufacturers as one of the finest productions for using gasoline which they have ever produced.



The Jewel Process Range.

No less than twelve thousand traction engines, it is stated, are at present in use in England for hauling heavy freight, or for passenger service, or for steam plowing, or as road rollers, and are built as a rule in one of three sizes. The smallest is an engine weighing nine tons when fully equipped and has cylinders 8 x 10 inches in size.

The Harper Stove Caster.

Harper Mfg. Company, Peoria, Ill., are offering this caster, as herewith illustrated. Four of these casters form a set, weighing about 12 pounds to the set and designed to carry 2000 pounds. They are for use under sample stoves in the store, and under stoves in the blacking room. As one person can place them under a stove and move it with ease, the casters are well adapted for use in private families for moving stoves when taking up carpets, and for storing stoves.

The Harper Stove Caster.

A correspondent in the stove and tinware business, writing to us from Seattle, Wash., says that trade in that city has been good ever since the great fire, and a flourishing business is anticipated for the present year.

The Comstock Pipe Cutter.

H. Comstock & Co., Fulton, N. Y., are offering this cutter, as herewith illustrated. It is made from steel drop forging, with all parts interchangeable. The cutter wheels are forged from fine cast steel, turned and tempered, and are fitted to the cutter block with a strong steel screw that can be removed with an ordinary screw driver in case of breakage and a new wheel inserted. The tool is provided with an abrading or scraping attachment that cleans the obnoxious burr and the hard rough scale that forms when cutting. In Fig. 2 the upper end of the pipe represents the clean bright surface resulting from the use of this tool, ready for the threading dies. The point is made that the cutter is light and strong, and made in three sizes, to cut pipe from ⅛ to ¼ inches.

Fig. 1.—The Comstock Pipe Cutter.

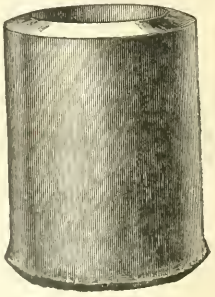


Fig. 2.—Showing the Work Done.

Unique Pickle Grabber.

Unique Mfg. Company, 35 Murray street, New York, are bringing to the notice of the trade a novel style of pickle tongs, as illustrated herewith. It is a silver-plated device, 8 inches long, with a stationary spoon and a movable claw, the latter actuated by a spring. After introducing the grabber into a bottle, as shown in Fig. 2, the knob at the top is pressed, when the movable claw opens; when the pressure is removed it automatically grasps the pickle. Pressing the knob again releases the pickle without injury to it, while the spoon serves the liquor. The prodding or stabbing of pickles with a fork is thus superseded by this unique contrivance. It may be utilized for serving sardines, oysters, pickles, olives, sliced cucumbers, &c. This is the first of a series of unique servers which will be offered by the company. Sugar and bonbon servers will be ready shortly, followed by sardine and asparagus servers,

Fig. 1.—Unique Pickle Grabber.

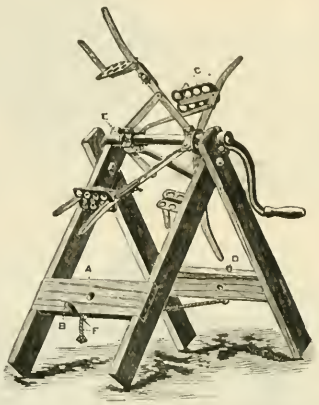
Fig. 2.—Pickle Grabber in Use.

each to be distinctively different in design and adapted to the purpose intended.

The agent of a Canadian firm interested in an attempt to establish a steamship line to Jamaica has returned after a year's absence in that country. He believes that a successful trade can be built up, both in provisions and manufactures. He concedes, however, that New York and Boston have the advantage in distance and in affording a better market, besides furnishing larger return freights. There are now in the American trade four large lines, and the circumstance is mentioned that four weeks ago 5000 packages were left on the New York dock for lack of ability to carry them. The reasons assigned for the alleged American monopoly is that manufacturers here have gone to the trouble to make goods especially for the Jamaica trade.

The Buchanan Combined Wire Reel.

The Buchanan Fence Company, Smithville, Ohio, are manufacturing the wire reel herewith shown. It is made of malleable iron, and when not in use, or when being taken from place to place, it can be folded so as to occupy a small space.



The Buchanan Combined Wire Reel.

The reel is adjustable, so it can quickly be made to fit any sized coil of wire, and is used for taking wire off of coils and also for coiling wire. Wire may be taken from larger coils and put on smaller ones, or wire can be taken from a fence and put on coils, making a coil of any size desired. It avoids tangling and ruining coils of wire, provides a practical way for retailing wire and leaves the original coil in good condition, and by its use allows any one handling wire to do it in a satisfactory manner. It is recommended by the makers for the use of hardware dealers, fence builders, farmers, &c.

The Jack Frost Freezer.

The Jack Frost Freezer Company, 29 Murray street, New York, are offering an

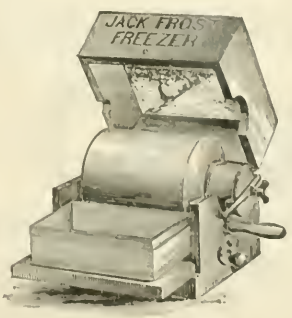


Fig. 1.—The Jack Frost Freezer.

improved form of their freezer, as illustrated in Figs. 1, 2, 3 and 4. Fig. 1 shows the article complete and ready for use. Fig. 2 represents the cylinder with the metal cap removed. In use this cylinder should be carefully packed with broken ice and rock salt, rammed solid with a flat wooden stick, using about one part salt and six parts of ice. When full the cap may be put on, a close joint being assured by using the rubber ring furnished. The handle is then attached and held firmly in place by means of the thumb

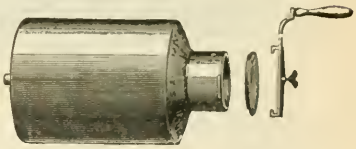

Fig. 2.—Cylinder with Cap and Handle Detached.

screw in the center. The mixture is then poured into the pan shown in Fig. 3, this pan being rounded at the bottom permitting the entire contents being used. By turning the crank very slowly the intense cold generated by the mixture of ice and salt will cause the liquid to adhere to the cylinder in a frozen state. It may be said the cylinders are now made much larger in proportion to length than formerly. At

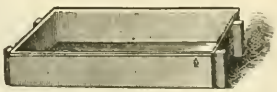

Fig. 3.—Pan with Rounded Bottom for Holding Mixture to be Frozen.

the ends of the box, as seen in Fig. 1, are knobs for raising and lowering of the pan. Fig. 4 shows the front or repacking box, which can be used to catch the frozen cream scraped from the cylinder by a hard wood implement sent with each freezer, so made that it may be attached readily to the repacking box, causing the material to pass into the receptacle as the crank is

Fig. 4.—Front or Repacking Box.

turned. These freezers are inclosed in varnished antique oak boxes, having a drop front which can be used as a shelf for the repacking box, or if desired to accumulate the entire contents of the pan on the cylinder before removing the box may be closed tight. If the cream is prepared hours before it is wanted, the box when packed may be covered with the tin top, the whole wrapped in a damp cloth and packed in ice and salt until needed. The manufacturers remark that by employing this method various mixtures may be frozen in less than 30 seconds.

The Davis Corkscrews.

Detroit Corkscrew Company, Detroit, Mich., are manufacturing a line of corkscrews, as illustrated in the accompanying cuts. The Davis corkscrew, Fig. 1, is

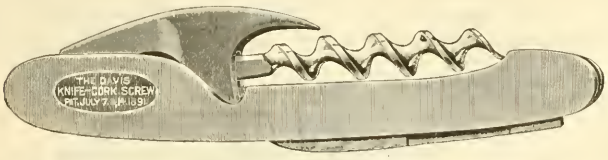

Fig. 1.—The Davis Corkscrew.

made of steel, polished, nickel plated, and combines a pocket knife, wire cutter and lever corkscrew. In use the wire is cut, as in Fig. 2, with the wire-cutting fulcrum; then the cork is pulled with the fulcrum in position, as in Fig. 3. The device is 4

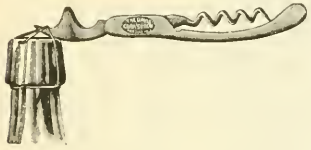

Fig. 2.—Cutting Wires on Bottle.

inches long, with a knife blade 2 inches long, and is intended to be carried in the pocket. The knife blade is designed for general use, or may be used exclusively for a fruit knife. This corkscrew is made in the same form without a blade, as shown in Fig. 2, of the same length as that in Fig. 1, but proportionally lighter. The

Fig. 3.—Drawing the Cork.

Puddefoot corkscrew, Fig. 4, is a folding pocket device, with a wire fulcrum to turn down in drawing the cork. These goods are neatly and substantially made, designed to fit any bottle, and may be operated by a woman or child. The company have recently completed a machine

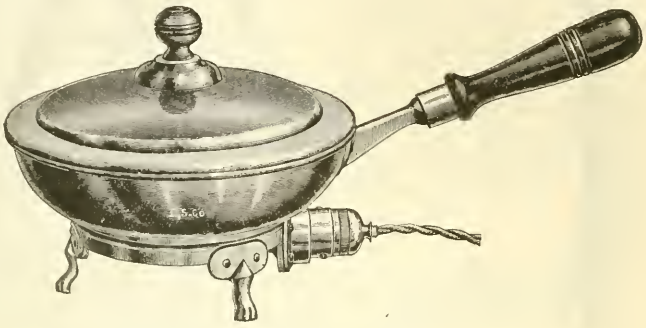
Fig. 4.—The Puddefoot Corkscrew.

for manufacturing the cut-worm screw, and are now in a position to compete with hand-made imported corkscrews.

A citizen of Tokio, Japan, now in this country, says that beginning about May 1 the Pacific steamships will have all they can do for several months transporting passengers from Eastern countries who are preparing to visit the United States.

Electric Chafing Dish.

In the accompanying illustration we present a general view of a nickel plated chafing dish designed to be heated by electricity, and which has just been introduced to the trade by the Carpenter Electric Heating Mfg. Company of St. Paul, Minn. This cooking utensil is made in a very substantial manner, having a cast-iron bottom plate and a body of heavy spun copper. The bottom plate is lined with asbestos felt, which protects the enamel in all cases, and is also fitted with a waterproof nickel-plated connection which is interchangeable, being the same size for all nickel-plated goods made by the company. The capacity of this article is said to be 1 quart, and will boil a pint of water in 9 minutes and a quart in 12 minutes. It consumes, according to the manufacturers' statement, from 4 to 5 ampères on 110 volts and 8 to 10 ampères on 50 volts. The device can be used, we understand, on any electric-light wire which may be in the house.



General View of Chafing Dish Heated by Electricity.

The screw propeller ferryboats have thoroughly shown their superiority since the rivers filled with ice, this being the first experience of the new boats on the Pennsylvania route across the Hudson River. While other boats are liable to have their wheels clogged and labor so hard that they are occasionally delayed to raise steam, the submerged propellers experience no difficulty whatever, and run nearly on schedule time. The large screw steamers on the Sound have done equally well.

Golden Crown Ware.

The Stuart & Peterson Company, Philadelphia, Pa., are introducing a line of this ware, as shown herewith. These goods are of fine annealed iron, tinned or porcelain lined, composition finished on the

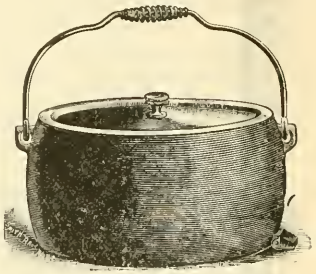


Fig. 1.—Golden Crown Ware.

outside and provided with always cold handles. The article shown in Fig. 1 is a flat-bottom oval boiler not in use, while Fig. 2 shows it with the device for regulating the heat under the vessel. This device consists of a V-shaped iron, hinged to a projection cast on the vessel, and when turned down raises one side of the boiler ¾ inch. The line of vessels include flat-bottom round boilers, flat-bottom

Fig. 2.—Golden Crown Ware in Use.

bellied saucepans, deep French stew kettles, deep French stewpans, fish kettles and oyster cookers. The manufacturers claim that the tinning on this ware is of the highest grade, or the porcelain lining of superior quality, and that the new composition on the outside will not chip off.

Record's Screw Caps and Spouts.

Record Mfg. Company, Conneaut, Ohio, have a line of screw caps and spouts on the market, representations of which are herewith given. Fig. 1 is a full-size cut of their 1¾-inch screw, with a sealing cap being put in place, which seals the nozzle air tight and secures the contents of the package during transportation. After the cap is put in, the screw cap is put on over the sealing cap, which not only seals it, but gives additional security. The point is made that should the screw cap become loose in transit, which is often the case, the sealing cap prevents loss of the contents of the can. Cans are also made with nozzles in which a cap is secured, but with no provision for using a screw cap over it. Record's 1¾ inch screw with vented screw spout is shown in Fig. 2, closed for shipping; and in Fig. 3, open for pouring; showing how the spout hangs in the can, and also when ready for use. This size is applied to shipping cans and other large cans that require free pouring. A drop screw straight spout, but without vent or wire, is made with a thread on the bottom of the spout, that screws into the thread over which the screw cap goes, and holds the spout in position for pouring. The screw cap has a cork in it which makes it tight.

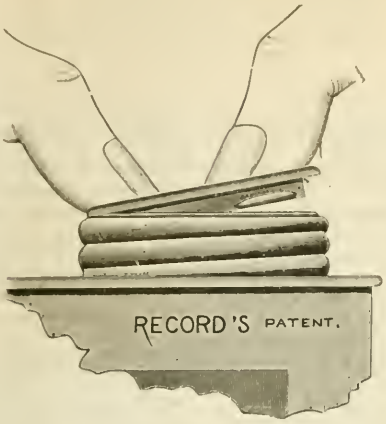

Fig. 1.—Record's Self-Sealing Screw Top and Cap.

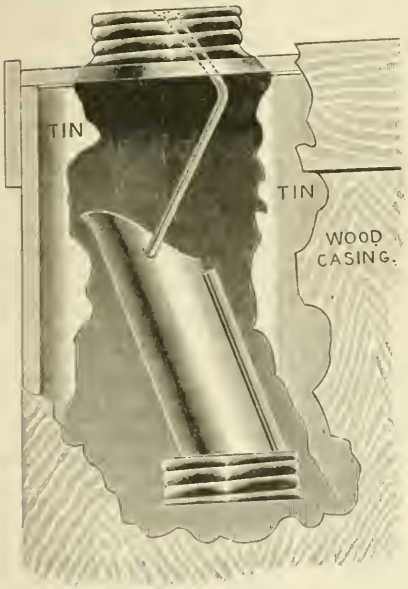

Fig. 2.—Record's Vented Screw Spout.

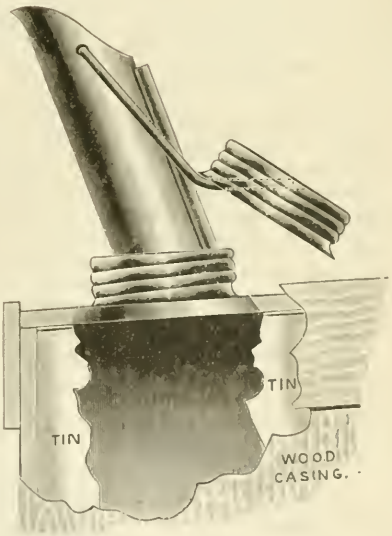

Fig. 3.—Vented Screw Spout Open for Pouring.

B. B. Wire Fence.

The accompanying illustrations represent the B. B. wire fence, being offered by B. B. Wire Fence Company, Indianapolis, Ind. B. B. wire is one continuous piece, nicely wound on wooden spools of from 80 to 110 pounds each. It is made of spring steel, heavily galvanized, and, the manufacturers claim, will not rust on account of age, season or climate. They also state that the wire will not twist, pull or sag; that the fence will retain its shape substantially as when first constructed; that it is quickly and easily applied to iron or wood posts, and that its application and tension can be readily adjusted and controlled by any kind of wire stretchers or wire lock now in use. The fence is referred to as possessing superior qualities of beauty and strength; of not destroying stock or even marking them for life by cutting or lacerating their flesh, and having the advantage of being low in price.

Fig. 2.—B. B. Wire on Spool.

Fig. 1.—B. B. Wire Fence.

TRADE REPORT.

The Iron Market.

The condition of the Pig Iron market has undergone no important change during the past week. While high-grade Irons and favorite brands hold their prices, there appears to be an unsettled and distrustful feeling in the trade, resulting in a drooping tendency to prices in general. The demand for Iron varies considerably in different sections of the country, but on the whole may be considered as fair. The hand-to-mouth policy pursued by many in buying has latterly given more steadiness to the trade than was formerly the case when large contracts were being placed for yearly requirements. While the condition of the Iron and Steel market, in both raw and finished material, is not all that could be desired, it is anticipated that large orders will soon be placed by corporations for supplies, which will likely have a salutary effect on prices all along the line, resulting in a more satisfactory condition of affairs. It is a notable fact that when one large concern places an order of this kind, others almost immediately follow. The month of January, which has just expired, shows quite a large volume of business, although quotations were not always strictly adhered to in effecting sales. There are a good many inquiries in the market at present, and considerable Iron will probably change hands in the near future. In New York the Pig Iron market is quiet, with indications that some Southern and some Northern companies are endeavoring to stimulate business by shading prices. Quotations remain unchanged as follows: Northern brands at $14.75 @ $15.25 for No. 1; $14 @ $14.50 for No. 2. Southern Iron, same delivery, $14 75 @ $15 for No. 1; $13 75 @ $14 for No. 2 and No. 1 Soft; $13.25 @ $13.50 for No. 2 Soft.

In Philadelphia the latter part of the last week in January was marked by dullness in the Pig Iron Market, and, while standard brands held their prices, other descriptions developed an unusual degree of irregularity. Whether some transactions were for financial reasons or because of the Ore situation is not known, but whatever the cause the effect has been to unsettle the market and to cause general indisposition to buy anything that is not actually wanted. A very large business was done during January, covering almost all grades of Iron, and it may be said at all sorts of prices, and, while the immediate outlook is not altogether satisfactory, it is still possible that the shaking up of the past few days may clear the atmosphere and ultimately lead to a better market. Quotations are unchanged, however, and are on the following basis:

American Scotch, No. 1X.....	$17.00	@ $17.25
American Scotch, No. 2X.....	16.00	@ 16.00

Reports from Pittsburgh state that a good many inquiries are in the market at present, and as buyers and sellers are nearer together in their views of prices than they have been for some time past it is not improbable that considerable Iron will change hands within the next week or ten days. The market on Gray Forge continues extremely dull, and a very limited amount of this kind of Iron is changing hands. Buyers have been unable to force the price of Bessemer Pig down to lower figures, and it is the impression that there would be no little difficulty in placing an order for Bessemer at this time, at a price 25 cents a ton in advance of that recently offered. We quote Foundry Irons as follows:

No. 1 Foundry	14.00 @	14.10.	cash
No. 2 Foundry	12.00 @	13.00	"
Charcoal Foundry No. 1....	19.00 @	20.00,	"
Charcoal Foundry No. 2....	18.50 @	19.00,	"

At Chicago the tonnage of Pig Iron booked during January has been very large, covering a good percentage of the buyers in that vicinity. The past week was characterized by an excellent general demand, although very few orders ran above 500 tons. A good feature of the trade at present is the fact that consumers are urging prompt shipment. Purchases by the smaller class of buyers are more frequent, which indicates that they are well employed. In fact, the foundries in this vicinity are reported as having seldom been in as active a condition in midwinter as they now are. The consumption of Iron thus keeps up very well, and manufacturers are looking forward to a year of good business. Prices, however, show no improvement, but on the contrary show weakness. Quotations are as follows, cash, f.o.b. Chicago:

Local Coke Foundry, No. 1... . ..	$13.50 @ $14.00
Local Coke Foundry, No. 2.....	13.00 @ 13.50
Local Coke Foundry, No. 3.....	12.75 @ 13.00
Local Scotch...	14.00 @ 14.50

In the Southern markets little or nothing has transpired during the past week which could be termed interesting. Consumers have adopted a waiting policy, and as furnaces still appear determined to maintain their prices there is no very large business doing. The month just closing has been a severe disappointment to furnacemen, both as regards volume of trade and prices, and at this time it looks as if February will not prove any better unless some radical change shortly takes place. The market certainly is weaker than it was when our last report was written, and unless consumers enter the market very shortly the future of prices will doubtless be downward. Furnaces which sell high-grade Irons still maintain prices, but as they are meeting with concessions every day, it seems only a question of time when they will have to reduce their prices. The consumptive demand during the week under review was fairly good, and the week's sales would foot up several thousand tons. For ordinary quantities we quote as follows for cash, f.o.b. cars St. Louis.

Southern Coke, No. 1 Foundry,	$14.25 @	$14.50
Southern Coke, No. 2 Foundry,	13.00 @	13.50
Southern Coke, No. 3 Foundry,	12.50 @	12.75

Billets and Rods.—The only transaction recorded is a sale of about 1500 tons of Foreign Wire Rods, Pacific Coast delivery, at private terms to two different works. Domestic Billets and Rods are weaker.

Steel Rails.—Eastern mills have taken contracts for over 70,000 tons, which includes sales of 60,000 tons to the Pennsylvania Railroad. This transaction is regarded as being of unusual interest, since it indicates that the great trunk line is placing its contracts. For many years it has been the practice of a considerable number of railroads throughout the country to follow the Pennsylvania in making purchases. Its entering into the market is a signal for more extensive buying, and it is believed that this year a similar movement will now take place.

Manufactured Iron and Steel.—The prospects for work in this particular locality are regarded as excellent. A number of office, bank and public buildings are known to be in architects' hands which will call in the aggregate for 7500 to 8000 tons of Beams within the next 90 days. This includes such structures as the Continental Life, Lincoln Bank, a large hospital, the Manhattan Life, the Astor residence, Corn Exchange Bank, Jewelers' Building and others. There are other structures being practically decided upon which will add several thousand tons more to the demand for Beams during the first six months. In addition to this there is the consumption of small lots for residences, flats and stores. Altogether, it seems certain that the consumption of Beams and Structural Material in the city of New York and immediate vicinity will be unprecedently large this year.

Metal Market.

Copper.—There is no perceptible change in the situation. Manufacturers of the general line of Copper and Brass Goods are well employed, the future of those branches of trade looks promising, and all signs point to a very much heavier consumption for electrical purposes in various

parts of the country. For the moment, however, the demand is tame, and enough small lots are knocking about to impart a sort of weakish appearance to the market.

Tin.—The transactions recorded on the Metal Exchange up to Wednesday involve about 600 tons. During the same time a moderate business was effected outside on regular terms, but, with free arrivals, it is doubtful whether the spot statistical position has changed for the better. Data of movement from the Straits also tended to impair the statistical position, the returns showing total shipments of 4000 tons during January, against 2980 tons in December, of which quantity 3650 tons were for Great Britain and the United States. Between the statistical exhibit, the legislation on "options" and uncertainties regarding the McKinley tariff, the horizon is variegated to an extent that bewilders nearly everybody identified with the market, as merchant, broker or speculator.

Pig Lead.—Large Consumers have secured a few hundred tons of Common domestic at slightly advanced prices. All told they have taken at least 1000 tons during the past week for shipment during the next 60 days. The low price of silver and the annual January curtailment of work at some mines, along with the periodical "shutdowns" here and there, are brought to the surface as factors in regulating values. Whatever there may be behind all this is problematical, but the result thus far is practically as outlined above, and the market shows firmness in tone that is not only interesting, but doubtless a little surprising in some quarters.

Spelter—Delivered in the East, is quite as free at the present time as it was a week ago. The demand has not improved, at least not sufficiently to be perceptible in this market. Some shipments to Europe have been made, but orders from that quarter are exceedingly few and far between, since prices for foreign product have receded.

Antimony.—Except for ordinary quantities there has been no inquiry. Supplies are ample and prices continue somewhat irregular.

Tin Plate—Very good orders have been secured from can makers and canners for 100 lb and lighter Bessemer Steel Coke finish Plates, with prices on latest dealings about 2¼¢ ℔ box above the lowest rates recently established. Special sizes used by petroleum canners have also been taken to a fair extent. Otherwise the business in futures makes a modest showing, and spot trade to all accounts continues to be of strictly routine character. There is no change in demand from retailers, as the weather is not such as to warrant a large amount of outside work. Prices remain unchanged.

Coal.

The great Anthracite Coal pockets in every direction at tidewater and interior points have been made bare by the unprecedented demand of the last few weeks. Zero weather not only increased consumption, but temporarily cut off supplies by blocking transportation. It is needless to say that Coal has been selling at a good profit, estimated by some at $1 advance over prices realized for a long time past, and that miners are consequently in a cheerful frame of mind. Trade at the present time has recovered nearly normal conditions. Spot Pea that has sold as high as $3.75, alongside, may now be quoted $2.65 @ $3 and Buckwheat is $2.25 @ $2.50, alongside. Reading is bare and is behind on orders for lack of transportation facilities. As a rule the companies are making deliveries with good dispatch, and the combine prices hold. Spot cargoes of Pea are still at a premium where necessities are imperious, for example, where a steamer is ready to sail and has no fuel. Production last week was 684,000 tons, a slight decrease compared with the same time last year, and since January 1 the decrease is 235,000 tons compared with the correspoding time last year.

John Edwards, the new New York sales agent of the Reading Company, is an old and valued employee of the company, having had full charge of the Coal trade for many years.

The Anthracite Coal shipments from Buffalo westward, by lake, for 1892, show an increase of 500,000 tons over 1891. The importance of this up freight as a factor in the threatened rivalry of the Canadian canal and St. Lawrence route with the American lake, rail and canal route is simply decisive.

The Bituminous trade is active and prices are firm. Operators complain that there are not enough railroads; that they could make big profits if they had Coal to sell. The price is about $3 50, regardless of kind. As they say, "Coal is Coal."

The following is the first publication of the Anthracite Coal tonnage shipped during 1892 for the roads named:

	1892.	1891.
Reading & Lehigh Valley	15,195,581	15 821,549
Jersey Central	5,271,131	5,857,968
Lackawanna	6,529,649	6,198,048
Delaware & Hudson	4,058,520	3,930,917
Pennsylvania	5,571,320	4,994,509
Pennsylvania Coal Company	1,921,020	1,892,419
Erie	1,388,822	1,204,271
Ontario & Western	807,071	69,770
Coxe Bros. & Co	1,210,187	43,882
Total	41,803,301	40,448,333

It will be seen that the increase for the year 1892 over 1891 was 1,144,983 tons. The Reading group, made up of Reading, Lehigh Valley and Jersey Central, showed an actual decrease of 1,122,483 tons. In order to arrive at the actual increase of the remaining seven companies, it is necessary to add this decrease to the total increase, making 2,773,788 tons.

It will be seen by the table that Coxe Bros. & Co. increased their tonnage 1,166,305 tons. The Pennsylvania Railroad shows the biggest increase, the amount being 576,811. This was due to the fact that the company were untrammeled by the combination and made a market during the dull months by shading the established prices. The next road in point of increase was Lackawanna, the amount being 331,601. Delaware & Hudson's increase was 118,609. The loss to Jersey Central of over 500,000 tons indicates that the combine to them was a failure.

Chicago Report.

Scrap.—Business is decidedly better. Consumers are now buying much more freely. Dealers quote the following buying prices:

	Per net ton.	Per ℔
No. 1 Wrought Scrap	$12.50	13½
Machinery Cast	10.00	....
Malleable Cast	8.00	....
Stove Plate (free of burnt)	7.50	....
Burnt Iron and Grate Bars	5.50	....
Sheet Iron and Hoops	4.00	....
Plow Steel and Breaking Stock	8.50	....
No. 2, such as Shovels, Hoes, &c.	4.50	....
Old Boilers—whole (Iron)	8.00	....
" (Iron)—cut in single Sheets and Rings	12 00	....
Old Gas-Pipe and Boiler Tubes	9.00	....
Cast Borings	5.00	....
Turnings	7.00	....
Horseshoes	13 00	....
Copper Bottoms	....	8¢
Copper Clips and Heavy	....	9½¢
Heavy Brass	....	8½¢
Light Brass	....	4 ¢
Pipe Lead	....	3 ¢
Tea Lead	....	2¾¢
Zinc	....	3 ¢
Rubber	....	2¼¢

Anthracite.—Business has seldom, if ever, been so scarce as it was last week. Numerous factories were obliged to shut down. Anthracite has consequently been in very active demand and prices are very firm. Quotations on carloads of 12 net tons are as follows:

	Grate.	Egg, Sto. and Cb.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
St. Joseph, Mo	9.05	9.30
Leavenworth, Kan	9.05	9.30
Omaha, Neb	9.05	9.30
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.85	8.60
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	9.35

The population of Canada in round numbers is 5,000,000 souls. The most accurate returns available are those furnished by the census of 1891. The table which follows shows the population in each province during the decennial periods from 1871:

Provinces.	1871.	1881.	1891.
Ontario	1,620,581	1,923,228	2,114,321
Quebec	1,191,516	1,359,027	1,488,535
Nova Scotia	387,800	440,572	450,396
New Brunswick	285,594	321,233	321,263
Manitoba	18,995	62,260	152,506
British Columbia	36,127	49,459	97,613
Prince Edward Island	94,021	108,891	109,078
Northwest Territories	...	56,446	98,967
Totals	3,625,024	4,324,810	4,882,679

This table exhibits a gross gain in entire Canada for ten years of 507,869 people. Of this increase over 160,000 is credited to four cities—Montreal, Toronto, Hamilton and Ottawa.

The ice blockade in Long Island Sound and in the coal ports adjacent to New York threw an enormous traffic over the Poughkeepsie bridge.

A bill in the Pennsylvania legislature provides for a manual training school for indigent children.

CONDITION OF THE

Hardware Trade.

January business was affected to some extent by the general prevalence of severe wintry weather, which, while it operated advantageously in promoting the sale of seasonable goods, interfered to a good extent with general trade. The reports which come to us, however, indicate that the aggregate of the month's business is fully up to the average, and in many cases has probably exceeded it. February opens with a fair demand, as the trade are placing their orders more freely, and a confident tone prevails which promises well for future business. Prices are without important change and the market as a whole is not characterized by a strong tone, a good many of the staple goods being exceptionally low. It is, however, thought by many that, in view of the large demand which is anticipated, there may be a strengthening of prices in some lines. There is some complaint in regard to collections.

Notes on Prices.

Cut Nails.—Cut Nails are in substantially the same condition as at our last review, the market having changed but little in the matter of price, with, however, a somewhat improved demand. Eastern mills are pursuing a conservative course with reference to production, being careful to avoid the accumulation of heavy stocks.

As announced in another column, the representatives of the Eastern and Western Nail manufacturers met in Philadelphia yesterday and adopted a National Price-List on Cut Nails, which goes into effect immediately and takes the place of the Nail card which has been in use. It was not formally determined by the meeting what would be the discount or the abatement from the list, this matter being left for the present to the judgment of each manufacturer. A prominent New York house advise us that the rebate will probably be $1.20 per keg, at the mill, in carload lots, and $1 on small lots from store in New York.

Advices from Chicago.—Manufacturers are doing a moderate business, but the local factories manage to pick up sufficient trade to keep running very steadily.

Wire Nails.—The demand for Wire Nails is unusually large, the mills receiving some heavy orders from large purchasers, and also a good many from the trade at large. Small lots from store in New York are quoted at $1.70 to $1.75.

Advices from Chicago.—The weakest sellers, who have latterly been demoralizing the market, have apparently been satisfied, and have now withdrawn from this market. Other manufacturers are consequently having a better trade and report plenty of inquiries. It may take a little time to recover from the very low level recently reached. Manufacturers have latterly been insisting strenuously on a good specification, refusing to sell low averages at the prices ruling. Small lots are quoted from stock $1.65 to $1.70.

Barb Wire.—This market is characterized by low prices, there having been as yet no recovery. The manufacturers are disposed to refuse to make concessions. The amount of business has been fair. There is an improvement in the export demand, and it is noted that higher prices prevail for export than for home trade. Small lots from store in New York are held at $3.10 for Four-Point Galvanized or $3 for carloads.

Advices from Chicago.—Barb Wire manufacturers state that inquiries are now unusually numerous, indicating an active trade in the near future. They quote $2.20 and $2.65 for Painted and Galvanized Wire respectively, but jobbers are underselling slightly.

The court has ordered the receiver of the Joliet Enterprise Company to sell the stock of Wire on hand in lots to suit purchasers instead of disposing of it to the lowest bidder It comprises about 2300 tons of Painted.

Home Tacks and Nails.—Atlas Tack Corporation, Boston, Mass., and 116 Chambers street, New York, are now putting on the market an assortment of Tacks for household use, which will be known to the trade as Home Tacks. These will be offered in different assortments and sizes. Each assortment is contained in a strong pasteboard box, very attractively gotten up, having a hinged cover, the top and front being tastefully printed in color. This box contains 12 smaller boxes, which are intended to be retailed, each box containing six papers of Tacks, namely, one paper of 1-ounce Curtain and 3-ounce Gimp, two papers of 8-ounce Carpet, and one paper each of 10 and 12-ounce Carpet. A larger assortment consisting of 24 boxes is also put up, and other assortments containing Tacks and Nails will, it is expected, be out before long. The list prices for Carton No. 50, containing 12 small boxes, is $3, and for Carton No. 100, containing 24 small boxes, $6, subject to a discount of 50 per cent.

Golden Crown Ware.—The following is the price-list of the Stuart-Peterson Company, Philadelphia, on their Golden Crown Ware, Tinned or Porcelain-Lined, with a new device for regulating heat under the vessel, of which a description was given in a recent issue. The list is subject to a discount of 60 per cent.:

Family Soldering Set.—A. S. Henn & Co, New Haven, Conn., for whom James P. Kenworthy, 96 Chambers street, New York, is agent, are putting on the market a Family Soldering Set which they call the Tinker's Dread. It is sold to the trade at $1.50 per dozen or $15 per gross.

Wrought-Iron Pipe.—Nothwithstanding the fact that the demand for Wrought-Iron Pipe has been large, and the mills have been diminishing their output, prices are weak and irregular. During the latter part of last month they were lower than they had been for some time, and remain in substantially the same condition notwithstanding the efforts of the manufacturers to advance them. There has been some conference with reference to re-establishing the association with a view to an agreement as to the production and prices, but thus far without result.

Aluminum Cooking Utensils.—The Illinois Pure Aluminum Company, Lemont, Ill., issue a circular relating to their Aluminum Cooking Utensils. It calls attention to the advantages which Aluminum possesses for such purposes, the following points among others being emphasized: That under no circumstances can poison be extracted from Aluminum; that this material is three times lighter than the lightest metal used for Cooking Utensils; that it is almost equal to silver in its heat conductivity and is superior to other metals in its retaining quality; and that Aluminum Cooking Utensils possess the advantages of porcelain-lined utensils without the annoyance connected with their use. The company also state that they are ready to purchase a used utensil of their own manufacture at scrap price, the price for scrap being given in the circular. Their price-list is as follows, terms net 30 days, 5 per cent. for cash on receipt of invoice:

	Per dozen.
1-quart saucepan	$4.00
2-quart saucepan	8.00
4-quart saucepan	16.00
10 inch fry pan	
10½-inch wash bowl	4.80
13-inch wash bowl	

	Per half-dozen.
Tablespoons	$1.50
Teaspoons	1.00
	Per pound.
Aluminum sheet of all gauges and widths carried in stock up to 18 B. and S. gauge and up to 12 inches wide, in lots of 50 pounds	$1.00
From 18 to 24 B. and S. gauge and up to 12 inches wide, in lots of 50 pounds	1.10

The circular also gives the scrap value of the goods as follows:

	Per dozen.
1-quart saucepan	$1.20
2-quart saucepan	3.00
4-quart saucepan	6.00
10½-inch wash bowl	1.50

National Price-List of Cut Nails.—At a thoroughly representative meeting of the Nail manufacturers of the country, held at Philadelphia on January 31, the policy of having a Nail Card was abandoned, and instead of this method of quoting and selling Nails a price-list was established covering the different kinds and sizes, such list to be subject to a discount, or, more strictly, a rebate per keg. This method was considered by the manufacturers to have important practical advantages over the Nail card, and the list has been arranged so as to permit a given rebate to apply to all kinds and sizes of Nails. This price-list is herewith printed and goes into effect at once, quotations by the manufacturers to be from this list and not from card, as heretofore.

The trade will recognize this as a radical departure. It is regarded with favor by some of the manufacturers, who heretofore questioned the advisability of a revision of the Nail card, and if in practice it is found to work satisfactorily it will be a matter of congratulation and will serve the convenience of the trade. Our readers will understand that the system now in force contemplates the quoting of Nails at a certain discount or rebate from list. For example, $1 per keg discount would make a 10d Common, the list of which is $3, to cost $2, and a 3d fine, the list of which is $4, to cost $3.

National Price-List of Cut Nails, Adopted January 31, 1893, *Subject to Discount* $ ... *Per Keg on All Sizes.*

	Common, Fence, Heavy Brads, Sheathing.	Casing, Flooring, Slating, Box and Eastern Finishing	Fine Blued and Fine Finishing.

Wringers.—Colby Wringer Company, Montpelier, Vt., have adopted a system of discounts and quantity rebates on their Wringers applying to the following prices, which are subject to a cash discount of 2 per cent.:

The Colby Improved Wringer.

No. 3	Rolls, 10 x 1¾	inches, per dozen	$36.00
No. 2	" 11 x 1⅞	" "	42.00
No. 1	" 12 x 1⅞	" "	48.00

The Premium Wringer.

No. 10	Rolls, 10 x 1¾	inches, per dozen	$25.00
No. 11	" 11 x 1⅞	" "	28.00
No. 12	" 12 x 1¾	" "	31.00

The company will be pleased to furnish information as to the discounts and quantity rebates on application.

National Saw Company.—There have of late been current a good many exaggerated and unfounded reports in regard to consolidation of Saw interests. The facts in the case are that the National Saw Company have bought the plants of Richardson Bros. of Newark, N. J., and the Harvey W. Peace Company of Brooklyn, N. Y. The capital of the National Saw Company has not been changed, remaining as before, $3,000,000. The officers of the company are:

GEORGE N. CLEMSON, president.
LOUIS DUHME, vice-president.
ROBERT J. JOHNSON, treasurer.
F. B. EARLE, secretary.

The offices of the company will be at 96 and 98 Reade street, New York City.

The company advise us that they have no intention of advancing prices, the consolidation having been effected to secure economy and efficiency in the manufacturing and marketing of the goods. The point is also emphasized that Henry Disston & Sons, Philadelphia, are entirely independent of the National Saw Company.

Glass.—It is understood that application was made at Madison, Wis., during the past week for a charter for the National Glass Company of Milwaukee, but that the headquarters in Milwaukee will be merely one of sufficient formality to practically comply with legal requirements and preserve the charter. A meeting of the company is announced to be held at Chicago this week, when it is expected that the work of organization will be perfected and a full staff of officers and a board of directors elected. The company propose, as outlined by the press, to control their members by the penalty of forfeitures deposited, otherwise capital stock must be subscribed. The deposit, or stock subscribed, under the agreement will be forfeited if the regulations are violated by any member. Jobbers will also be admitted to the company. There has been no decrease in the number of pots in operation since the Glass factories started up last summer, for while many houses which were operating last fire are either idle at present or have gone out of business, there has been more than a corresponding increase in new factories and in the capacity of old ones. It is reported that there are 1681 pots in operation, which is an increase over the number employed at any time during 1892.

Local trade in both American and imported Glass is quiet, though out-of-town trade is reported as fair. Prices in both lines are fairly well maintained, probably being somewhat stronger in anticipation of the successful organization of the National Glass Company. There are no new developments in the Plate Glass market. Prices remain unchanged, as follows:

American Window Glass, 1000-box lots or more, 80 and 15 per cent. discount; carloads, 80 and 10 per cent. discount; less than carloads, 80 and 5 per cent. discount. French Window Glass, 75 and 10 and 5 per cent. discount. American Plate ranges in price from 60 and 2½ per cent. discount to 60 and 5. Imported Plate Glass, 60 per cent. discount to 60 and 10 and 5 per cent. discount.

Old Rubber.—The following are the current prices paid for Old Rubber delivered in New York:

Trade Notes.

THE BERGER MFG. COMPANY, Canton, Ohio, in another column of this issue present an announcement relating to Steel Roofing. The advertisement also refers to Corrugated Iron, Steel Brick Siding, Eave Troughs and Cornices.

THE TOLEDO TINWARE MFG. COMPANY, Toledo, Ohio, are directing attention to IC Sap Pails which they manufacture.

RIVES, SCHIRCK & CO., Rochester, N. Y., make reference elsewhere to their line of Registers, showing one design in the announcement.

GERMAN PUTZ-LIQUID is the subject of an advertisement of the Meyers-Putz Pomade Company, 271 Franklin street, Boston, that appears in another column of this issue.

JOSEPH W. WAYNE, 124 Main street, Cincinnati, Ohio, is calling attention to Wayne's Cork Filled Self-Ventilating American Refrigerator.

P. B. CALVERT & CO., 68 North Second street, Philadelphia, Pa., in their advertisement elsewhere, illustrate and briefly describe the Earl Revolving Ventilator and Chimney Cap, which is made of galvanized or kalameined iron, and is stated to be a sure cure for smoky chimneys.

THE FLETCHER FIRE MAT COMPANY, Murdock Block, Cincinnati, Ohio, make a prominent announcement in our advertising columns this week respecting the Fletcher Fire Mat, in which they present illustrations and point out its numerous uses and advantages.

JOHN DUNLAP COMPANY, Pittsburgh, Pa., are directing attention to their special brand of Roofing Plate, which they describe as "Dunlap's Double Dipped," made by the palm-oil process.

UNDER RECENT DATE the firm of John Dunlap & Co. announce that owing to the death of their senior partner, John Dunlap, on June 6, last, the firm of John Dunlap & Co. were dissolved. Under same date the announcement is made by John Dunlap Company stating that they have purchased the machinery, merchandise and good-will of the late firm of John Dunlap & Co., manufacturers of Stamped and Japanned Tinware, which business the late John Dunlap had successfully conducted for almost 53 years, consecutively.

THE WORKS OF THE Clark Novelty Company, Rochester, N. Y., were destroyed by fire on January 21, a portion of their machinery and office effects being saved. Another location was at once decided upon and new works are now established at 21 and 27 North Water street, Rochester. New tools and machinery requisite for the manufacture of their specialties are being placed and the business which, at the time of the fire, was in a most prosperous condition, will be resumed with only slight interruption.

FROM THE ILLINOIS PURE ALUMINUM COMPANY, Lemont, Ill., we have received copies of their recently issued circulars. One is the general announcement of the company directing attention to their Cooking Utensils and pointing out the merits they possess. They also inclose a paster, which, we presume, they send out with their vessels. It likewise describes the advantages of this metal, and, what is novel and of interest in sending out Kitchen Ware, there is a line stating what the scrap value of the utensil is, which means that the company will pay that amount for the utensil if injured.

WE ARE INDEBTED to Rives, Schirck & Co., Rochester, N. Y., for a tasteful calendar that they are sending out to their friends in the trade. It is of convenient size and prettily decorated with a spray of apple blossoms and two highly colored birds, the appropriateness of which is that by the time the birds get back Registers will be in demand, and the above company ask their customers to bear them in mind. With the calendar is a little trade announcement of the same concern, and they also issue an illustrated price-list of their goods.

GEO. A. KEMPER, Akron, Pa., is building an addition to his establishment for the purpose of adding Hardware and House-furnishing Goods to his business.

ACME STAMPING COMPANY, East Stroudsburg, Pa., call attention, in a circular, to their Acme Dinner Pails, with Strayer's Patent Combination Ear and Cover Fastener. The pail is illustrated on the leaf, and seven reasons are given why it should be used in preference to other dinner pails.

THE DENVER STAMPING COMPANY, Denver, Col., manufacturers and importers, issue a catalogue of the goods which they manufacture and deal in. The volume is neatly gotten up, contains about 50 pages and is freely illustrated. The first section is devoted to pieced Tinware, next comes Japanned Ware, the last including such articles as Tyler's Flour Receptacle and Sifter, Tea and Coffee Caddies, Spice Cans, Oil Tanks, &c. The next section is devoted to Black and Galvanized Iron Ware and at the close of the pamphlet reference is made to Stove Boards, Stamped Ware, Granite Ware, Tinners' Trimmings, Hollow Ware, &c. A later circular issued by the same company pertains to some of their leading specialties for 1893. The goods shown embrace Water Coolers, Oil Cans of several sorts, Flour Sifters, Cad dies, Dinner Pails, Lard and Honey Cans and other articles. The firm issue separate catalogues of Plain, Stamped and Japanned Tinware.

JOHN C. RIMES & CO., 34 Wabash avenue, Chicago, issue a notice to the jobbing trade, reminding them of the Copper Wash Boilers which they handle, describing them as made of 14-ounce planished copper with drop handles riveted by cleats and drop covers. Inclosed with the announcement are circulars relating to a number of goods which the company either manufacture or handle as manufacturers' agents. Among the printed matter are circulars relating to goods of the Ohio Lantern Company, Tiffin, showing the Brilliant and Standard Tubular Lanterns and others; also the Steel Ash Cans of L. H. Chubbuck & Co. of Boston. Other goods noted are Shelf Brackets, Axeline, Cyclone Post-Hole Digger, &c.

THE SMITH & ANTHONY STOVE COMPANY, 48 Union street, Boston, Mass., make an interesting announcement in our advertising columns this week respecting The Hub Hot-Water Heater of their manufacture. They print a very flattering letter from one who has used this Heater, showing what it does in active operation.

WILLIAM J. H. GLUCK, Baltimore, Md., distributes a series of catalogues and circulars of his manufactures. One, entitled "List No. 16," is a condensed price list of factory and railroad Milk Cans. The little publication contains some 30 pages and illustrates a variety of cans, besides giving a table of sizes and price-lists. Other page circulars draw attention to Gluck's oil can and Gluck's steam cooker, made in various sizes.

HALL & CARPENTER, 709 Market street, Philadelphia, Pa., send a series of Steel Engravings on cards, which are held together by a ribbon and form a handsome calendar for 1893. The dates of two months are given on each of the six cards forming the set, the engraving on each card representing scenes appropriate to the season of the year covered by the month. Thus for January and February a winter mountain scene is shown; for March and April a fishing smack, &c. On the back of each card are dates for the entire year. Each card calls attention to a different line of goods which the firm import or for which they are agents. The calendar is artistic in execution and arrangement, and is entitled to a prominent place in the office.

THE NEW SHEET MILL of the Lalance & Grosjean Mfg. Company, at Harrisburg, Pa., is ready for operations and will be started up in about a week. All of the machinery of the different departments is in position, and the billet mill is already in operation. The principal product of the works will be sheets for consumption in the company's factory at Woodhaven, L. I.

THE MURRIN HAT REST COMPANY, 1515 South Jefferson avenue, St. Louis, Mo., in an advertisement elsewhere, direct attention to Murrin's Hat Rest, illustrate it and refer to its advantageous features.

AMONG recently authorized corporations in Illinois are the following: Detroit Heating Company, at Chicago; capital stock, $10,000; for the manufacture of boilers, engines and heating apparatus, plumbers' and steam fitters' supplies; incorporators, Frank M. Peters, Frank A. Winslow and John G. Nazro. The Aurora Bicycle Company, at Aurora; capital stock, $10,000; for the manufacture of bicycles; incorporators, Walter S. Frazier, Jr., Edward S. Frazier and Lincoln B. Frazier. The Buerk Hardware Company, at Chicago; capital stock, $25,000; for dealing in hardware; incorporators, Martin M. Gridley, Luther Ellison and Edward A. Cross. The Boles Company, at Chicago; capital stock, $6000; for the manufacture of spreaders for road, speed and draft horses; incorporators, E. Duthil, N. A. Throop and George N. Lyman. The New Haven Silver Plate Company, at Chicago; capital stock, $600,000; for the manufacture of silver and plated ware; incorporators, S. O. Livenson, William M. Northrup and Benjamin V. Beeker. The Bremer Strand Company, at Chicago; capital stock, $10,000; for the manufacture of dividers, calipers and forging dies, and for manufacturing in wood and metals; incorporators, John Bremer, E. E. Barrett and E. J. Hamel. St. Louis Smoke Preventing Company (operating under S. E. Flint's patents), at East St. Louis; capital stock, $60,000; for the manufacture of smoke preventing devices; incorporators, S. E. Flint, W. F. Mills and William Kuehne. The Chicago Steel Spring Company, Chicago; capital stock, $200,000; incorporators, Douglass C. Gregg, Malcolm Daleowen and Ross C. Hall. Chicago Smokeless Furnace Company, Chicago; capital stock, $100,000; incorporators, Charles E. Walker, Delos Carskaden and John D. Brinkerhoff. S. K. White Company, at Chicago; capital stock, $200,000; for the manufacture of machinery; incorporators, E. P. Hatch, R C. Rtscher and S. K. White. The Illinois Stoker Anti-Clinker Grate Bar Company, at Chicago; capital stock, $250,000; for the manufacture of grate bars; incorporators, Charles B Bean, Fred S. Bean and Watson Ryder. The Victor Key-Opening Can & Machinery Company, at Chicago; capital stock, $1,200,000; for the manufacture of key-opening metal cans and the machinery for making the same; incorporators, Edward Barray, Charles O. Johnson and Louis Spahn. The Mendota Metal Body Carriage Company, at Mendota; capital stock, $10,000; for the manufacture of metal body vehicles; incorporators, John Schaller, Matthew Wilson, C. Henning, C. W. Russell, H. B. Aldrich and Benjamin Tanner.

THE IRON CLAD MFG COMPANY, 22-24 Cliff street, New York, inform us that although they have added materially to their facilities in the way of presses and machinery, and have lately doubled the capacity of their plant over last year, making it three times as large as two years ago, they are being pushed to execute their orders. They refer to trade as very good, and add they are now making a large line of Stamped and Pieced Enameled Ware, to which they are continually adding in the way of new goods.

HAYDOCK & BISSELL, 12 Murray street and 15 Park Place, New York, announce a large trade sale of Cutlery on Wednesday, Thursday and Friday, February 8, 9 and 10, particulars in regard to which are given. This is the opening Cutlery sale for 1893, and is an important one for buyers of Cutlery to attend, as all the goods will be sold without reserve in quantities to suit the jobbing and retail trade.

BRITTAN & BOND, 154 Lake street, Chicago, are representing the Duffy & Lovelock Tool Company, who are manufacturing a line of fine Steel Tools. It is their aim to offer the very best Steel Tools made, and all goods marked Duffy are fully warranted. Their line includes Vest-Pocket Berry-Box Openers, Hip-Pocket Crate Openers, Boot and Shoe Dealers' Case Openers, Cigar Box Openers, California Fruit-Case Openers, Duffy's Wine-Case Openers, Concrete Tools, the Chicago Gate Hinge, Cabinet Makers' Bench Hooks, Bricklayers' Hammers and Chisels, Cold Chisels, Punches, Tinners' Chisels, Tinners' Punches, Hand Groovers, Rivet Sets, Blacksmiths' Cutters and other Tools. Their 1893 catalogue illustrates these goods with descriptions and prices.

THE H. B. SAHLER FURNITURE & CARPET COMPANY, Atchison, Kan., have purchased the stock of Hardware, Stoves, House-furnishing Goods, Tinware, &c., formerly carried by Herman Jochems of that city.

WITH the compliments of Geo. M. Scott & Co., 168 Main street, Salt Lake City, Utah, is sent a handsome metallic end banger, to the lower part of which are attached calendar leaves for 1893. The larger portion of the card is taken up with the head and shoulders of a young lady, done in colors, of more merit than usually found in this class of advertising. Under the firm's name at the top is a business card calling attention to their stock of hardware and metals.

JANNEY, SEMPLE & CO., Minneapolis, Minn., have just issued a handsome catalogue of 1105 pages, substantially bound in leather and cloth, with beveled edges and of a fine quality of paper. The desirable arrangement of the cuts and list prices is particularly noticeable, while the whole book gives evidence that neither time nor expense has been spared in compiling it. On the first page is given a view of their stores, 30-36 South Second street, corner First avenue. Goods are classified in departments, which are enumerated on the page opposite the index, as follows:

Mechanics' and Edge Tools	Pages	1 to 200
Farming Implements and Miscellaneous Hardware	"	201 to 516
Builders' Hardware	"	517 to 804
Pocket and Table Cutlery, Razors, Scissors, Shears, &c.	"	805 to 888
Fishing Tackle, Revolvers, Ammunition, Skates, &c.	"	889 to 968
Granite Iron Ware, Pieced and Stamped Tinware, Tinners' Trimmings and Stock	"	969 to 1,044
Tinners' Tools and Machines	"	1,045 to 1,064
Blacksmiths' Hardware, Iron, Steel, &c.	"	1,065 to 1,105

The catalogue embraces a large variety of goods and is especially adapted to the wants of the Northwest trade.

BURN STAMPING & MFG. COMPANY, 66 Lake street, Chicago, advise us that they are producing all their own Steel Plates used in the manufacture of milk cans and also Roofing Plates 20 x 28 inches.

BREGENZER & ZILISCH have purchased the hardware store of the Rendtorff Hardware Company at 291 and 293 North avenue, Chicago. They will not only handle builders' hardware and mechanics' tools, but also stoves, ranges, furnaces and house furnishing goods. The firm consists of M. M. Bregenzer and C. A. Zilisch.

It Is Reported—

That the Hardware store of J. F. Barber & Co., Phillipsburg, Pa., was destroyed by fire on the 16th ult. The loss was $9000; fully insured.

That the Allerton-Clarke Company, have been formed in Chicago. The capital stock is $50,000. The company will deal in Hardware. The incorporators are Cortlandt C. Clarke, Crandall A. Rosecrans and Samuel W. Allerton.

That W. H. Wibbs' Hardware store, at Prospect, Ohio, was damaged by fire on the 16th ult. Loss, $1000.

That Frank Dorrance, son of W. H. Dorrance, Hardware merchant, Camden, N. Y., has been taken into partnership. The firm name will hereafter be W. H. Dorrance & Son.

That Elliot & Kennedy have opened a Hardware store at Hamilton, Ohio.

That the Peters Hardware Company have been formed at Emporia, Kan. The directors are George B. Peters, Edwin R. Peters, Hattie G. Peters and George W. Goodding, all of Emporia. The capital stock is $40,000.

That Konow & Donovan are a new Hardware firm at Ivesdale, Ill.

That Henry G. Burrell, dealer in Hardware and Tin, Stoughton, Mass., is erecting an addition to his store.

That Augustus Young is about to sell out his Hardware business at North Berwick, Maine.

That a new Hardware store has been opened at Sarahsville, Ohio, by Chas. F. Hellyer.

That James Ferman, dealer in Hardware, Creston, Iowa, has taken Frank Kingsbury of Adair into partnership with him.

That the Lofton Hardware Company of Chattanooga, Tenn., who were recently incorporated, have commenced business at 824 Market street. For the present the company will confine themselves to the retail trade, and will handle everything in Heavy, Shelf and Builders' Hardware. Their specialty will, however, be Sporting Goods, and Rifles, Guns, Baseball Goods, Fishing Tackle, &c., will be carried by them. The officers of the company are: Jno. M. Lofton, president and treasurer; W. H Boyle, vice-president, and H. B. Rigg, secretary.

That David Nesbit has embarked in the Hardware business at Brockport, N. Y.

That Indianola, Iowa, has a new Hardware store, the proprietor of which is F. L. Beymer.

That the Hardware firm of Bressler & Schmehl, Lebanon, Pa., have been dissolved by mutual consent, and the interest of Mr. Bressler has been purchased by C. Dorsey Gloninger. The business will hereafter be conducted under the style of Schmehl & Gloninger.

That the Hardware firm of Humphrey & Brown of Delevan, N. Y., has been dissolved, Mr. Humphrey retiring.

That H. A. Cook of Hoopeston, Ill., will move his stock to Ladoga, Ind.

That C. M. Smith is closing out his Hardware business at Cloverdale, Cal.

BRITISH AGENCY: The Ironmonger, 42 Cannon St., London, England.

The Cincinnati office of *The Metal Worker*, in charge of Henry Smith, manager, has been removed from the southeast corner of Fourth and Main streets one square north, to the Pickering Building, on the southeast corner of Fifth and Main streets, opposite the United States Custom House and Post Office.

Catalogues and Catalogues.

The trade catalogue is a feature of modern commerce that is here to stay. By no other means can a manufacturer get so thoroughly in touch with customers, or those he desires to become customers, as through a well-designed, well-written, and well-executed catalogue. But the adjectives "well-designed, well written, well-executed" imply their opposites, at least as a possibility, and any one competent to judge of the matter can, in a collection of catalogues, satisfy himself that the possibility becomes a reality in many instances. "A collection of catalogues!" Does any one ever make what may be termed a collection of catalogues? Yes, a library of catalogues, if you please, and if well selected a very valuable library of reference and of technical information it may become. In the first place, it is a rare repository of words and terms used in the trades. Were a publisher to undertake the production of a dictionary of such words, the very best thing he could do would be to buy, beg, or otherwise obtain as large an assortment of such catalogues as he could get together, and set a compiler to making an alphabetical list of the trade terms they contain with the names of the catalogues in which they are to be found. Secondly, a vast store of useful information may be culled from a collection of well-prepared catalogues. It has come to be the custom to render these books worth preserving. They are useful to the draftsman, who needs on occasion to refresh his memory as to the form of a particular kind of a screw, a valve, a fitting, an implement, or what not. They are useful to engineers, who can find therein standard dimensions, tables of strength of materials, delivery of pipes under varying conditions of pressure, &c., the items of information named being only samples of a thousand points of practical usefulness such books when collected may contain. He who seeks information for its own sake may also often find explanations of the action of machines, tools or apparatus that he might vainly search for in books of a more ambitious sort. A carefully arranged and indexed set of catalogues on the shelves of an engineer's or architect's office indicates that their owner is a man who delves deeply for practical knowledge, no matter how well he may be equipped with the knowledge gained in schools.

Some Defects in Catalogues.

Of course a catalogue may be prepared in an inartistic style as to its printing, illustration, paper and binding. Such deficiencies lessen its value, in the same way as they would lessen the value of any other book of reference. The primary purpose of a catalogue is that, as a work of reference, it shall assist customers in ordering goods from the list it contains. The better it can be printed and illustrated the better it will subserve this primary purpose; and the better the paper and binding the longer it will last in use; so that, as a measure of economy, good work in a catalogue is as desirable as in a book intended for library or professional use. In the preparation of some large catalogues (many could be cited in the stove and hardware trade that are large quarto volumes) thousands of dollars are not infrequently expended on a single edition. These are furnished without cost to actual, regular customers, and though from previously unknown parties a price is often charged, it is very doubtful that any edition of any catalogue by direct sale could ever be expected to reimburse to its publishers the cost of its production. We recall to mind a catalogue of surgical instruments issued by a prominent American manufacturer which is nearly as large and thick as Webster's quarto dictionary, and which is illustrated by perhaps two thousand wood cuts. Another in the hardware trade reaches about similar proportions. Another in the stove trade on magnificent paper, with illustrations of the finest quality, and elegantly bound, is a book that, if its subject pertained to general literature, art or technical science, would be considered cheap if single copies were sold for ten dollars. But there is not much need of further emphasizing the importance of good style and good work in catalogues; the examples cited, and the fact that the preparation of catalogues in connection with other advertising has given rise to a distinct profession in which expert skill in this kind of work is placed at the command of any firm that wishes help in so important a matter, are sufficient to indicate that experienced business men have not overlooked its importance.

Explicitness in Trade Catalogues.

The worst defect, however, that can exist in a catalogue is want of explicitness. Essentially a book intended to impart information, its author should not jump to the conclusion that because long familiarity with the facts he states gives him a complete understanding of them, a very brief, concise statement will enable others who have not had his training to grasp the idea he wishes to convey with equal readiness. This error in writing is all too common among those who write articles for trade papers; it should be most carefully avoided in a catalogue. If, in a catalogue of tools, machines or apparatus for any purpose it is found necessary to require some essential adjustment, manipulation, lubrication or order of procedure radically different from what is usual with other analogous appliances, the reasons for this departure should be carefully set forth, else the purchaser may naturally suppose these requirements are not absolutely essential to the operation of the machine, but are merely the preferred way of the manufacturer of the articles. Many a failure in the use of machines and tools has resulted from want of proper explanation of the reasons underlying the directions given for their use, and even though the manufacturer may legally shield himself behind the directions and throw the blame for the failure upon the user, who did not follow them in every particular, it is not good business policy to risk such results when the risk could be avoided by remembering that his future customers will probably be no more inclined to act in a specific way without specific reasons than he himself would. The common-sense view of mankind is that which assumes the majority to be endowed with common sense; and the common sense of most people revolts at apparently mere arbitrary requirements—requirements that could probably be made to appear perfectly reasonable by a judicious explanation of why they are necessary.

Wage Fluctuations in Germany

The United States Consul in Cologne, in a recent report, gives an interesting summary of a number of statistics collected by various trade unions on the fluctuations in wages in 906 German cities and 924 unions. The figures show that wages have increased in only seven cities, while they have declined in 229, and have remained stationary in the rest. The machine industry, representing 400 local unions, with 20,000 members, shows only two places in which wages have lately risen; in 72 they have declined, while in the balance they have remained stationary, although the

price of food has risen. In all the great centers of the machine industry wages have decreased, such as Aix-la Chapelle, Berlin, Breslau, Dortmund, Dusseldorff, Erfurt, Essen, Leipsic, Magdeburg and Nuremburg. In only 211 out of 906 cities was there full employment, while in 30 there was an almost complete stoppage of work. It is stated, also, that in most parts of Germany to-day the workman alone cannot earn enough to support his family. With a family of four persons the average expenditure appears, from "family budgets" which have been collected, to be about $260 a year, while the earnings of the head of the family alone amount to only $194.

Magnetism of Great Cities.

An increasing drift of the rural population citywards is one of the most marked features of the age. Such is the present condition among the people of all civilized countries, the United States being no exception to the rule. In almost all the older and more thickly-peopled States of this country the large cities are absorbing the youth of the rural districts and increasing rapidly in size, while the census shows us that the country villages and smaller towns either remain stationary, as regards population or go backward. This tendency is to be accounted for in more ways than one. First and foremost, however, may be placed the attraction of pecuniary advantage. Wages in the city are higher than they are in the country; there are there more opportunities of money making, among the vast number of industries, manufacturing and otherwise, than present themselves in country life. Consequently the country youth, male and female, imbibe from their earliest years the idea of one day going to the city "to better themselves" or "make their fortunes." This is a natural tendency and, within certain limits, is not to be deplored. Indeed, it is a laudable ambition, provided the aspirant possesses the necessary qualifications for success in life. But the question arises, *Does* the rural immigrant generally better himself? It is hard to answer. Leaving out the moral and physical aspects of the question, and looking only at the financial side, we cannot but think that a considerable proportion of those who come to the great social and commercial centers, expecting to find highly-paid labor awaiting them, with prospects of speedy fortune and independence in the near future, would do far better if they were to remain in the sphere in which they were born.

Employment in Cities.

It is true that a bright, smart youth finds in the city a fairer field for his talents than he would find by remaining in the country; and, provided he possesses the requisite moral qualities, such a person will undoubtedly make his way, But for the lad of no particular points or education the streets of the city are not paved with gold. In the congested condition of so many of our great centers nowadays, the struggle for existence is daily becoming more pressing. Employment is hard to get except for skilled labor, even in the numerous manufacturing industries which have multiplied to such an extent within recent years, while as to other employments, foreign immigrants crowd the principal seats of wealth and activity, and their competition in the labor market is hard to meet. The cost of living is far higher in cities, and whatever advantage is gained in respect of wages is generally neutralized by increased expenses. Moreover, the physical comforts and general conditions of existence are by no means better in a New York tenement house and factory than they are in a country workshop or on a farm. We would not desire for a moment to discourage legitimate ambition or the natural tendency which impels young and ardent minds, who feel their own strength, to try it in the fiercer strife of the great cities. Let them come, and carve out their fortunes, by all means. But to those who have a fair prospect before them in the country town or village where they now are, we would say: Think twice before you cast away the substance —perhaps only to grasp the shadow in its place.

How To Do, Etc.

BY FOSSIL.

There are several texts in *The Metal Worker* which will serve as inspirations to possible writers who may feel a call to use them. The letter of "A. R.," in issue of January 21, offers a comprehensive theme for both the "old and young boys" for the questions "How to do work," and "How not to do it," are of broad import. It seems to the writer that, How to do? is not confined to the specific directions which a veteran might give regarding the doing of a particular job, but rather asks for broader information, which shall be of general application. It is possible that there are mechanics who are in possession or trade secrets—as referred to by "H. J.," in Letter Box—which, if made public, would materially assist some brother chip without injuring the original holder. Imparted knowledge does not diminish learning's store, but "H. J.'s" man seems to be of that kind who answer all questions with a "What will you give to know?" Such men are probably rare, and little loss would occur should their secrets perish with them. "There is nothing hidden that shall not be revealed" in the line of metal working, for if men will refuse to assist in a private way, as in the case of "H. J.'s" "deacon," or neglect a public call, as per "A. R.," there remains the choice of asking *The Metal Worker* or working out the problem for one's self. There is a reminiscence of old time which may come in here as apropos to both the letters referred to above. There was a tin shop where worked an apprentice who applied to older hands for information in laying out elbows, this being at that time a trade secret and patterns not furnished. But failing of assistance, he helped himself in this way. Taking a joint of stove pipe, he immersed a part of it in water at the angle of his desired elbow pattern, then cutting the miter on the water line and making the pipe a plane surface, he got on to the track of that trade secret and by a little more study and experiment made it his own, with no thanks to the former monopolists.

Taking the question of How to do? on the wide ground before referred to, there are certain cardinal methods which the experience of the veterans has proved to be of advantage and these have been often mentioned in the way of advice, which, as has been said, is sometimes more blessed to give than to receive. But usually the persons so advised prefer to "go it alone," practically doubting the wisdom of the ancients, also if told how not to do, they often copy the lady who, being advised not to marry by one who "had seen the folly of it," said she desired a like experience for herself. Everybody has read the directions in Mrs. Glass' book for cooking a hare which begin with "First catch your hare." We may say first choose your trade. There are too many round men found in square holes or *vice versa*, because care was not taken in the start, and a nature diverted from its original tendencies will not succeed like that which, as we say, was born for the place. In boyhood we used to turn the tops of young hickory trees downward and lash them to and parallel with the trunk; after a while the forced crook would become permanent and a tolerable walking stick was made by spoiling the tree in its youth Circumstances, precedents, unwise counsels and other binding forces have made poor walking sticks from boys who might otherwise have grown to larger usefulness.

Having carefully chosen and demonstrated the wisdom of the choice, go in to win by making, as a veteran worker puts it, "every blow count." The man who does a good job in a good way has a regular chain of linked operations in mind, each important in its place and each connecting in order—every moment from start to finish conducing to the desired result. In like manner let the apprentice learn that patient climbing, with every advancing step well considered and no false motions made, will get the desired eminence in his craft more certainly than a soaring ambition that ignores details. There was a lesson taught by watching workmen lately making ships' cables at the Charlestown Navy Yard. Link by link the iron constituents were heated, attached and welded one at a time, receiving the care and attention of the operator, and so the massive chain grew long and strong in proportion to the soundness of material and the good work done on each individual link.

A young mechanic may study with profit the operations of those automatic machines which seem almost like sentient beings, carrying on their processes of manufacture orderly and consecutively from the introduced material to the completed article. That steady, do one thing at a time and do it well, shows the good workman as well as the good machine. It does not follow that a man having attained to the preciscness and regularity of a machine should remain contented. There are ideas born of practical hands and thinking heads which culminate in useful and valuable inventions, and those mechanical successes, which are not the result of patient plodding, industry of hands coupled with earnest study of brains, are the exception and not the rule.

Secretary Wilson of the New York Chamber of Commerce presents statistics showing that the present market value of the silver purchased by the Government since the passage of the Silver act of 1878 is $351,457,257. It cost the Government $432,372,907. The loss in value of the metal amounts to $80,915,650.

The Bank of England holds about $15,000,000 more gold than it did a year ago, the Bank of France $40,000,000 more, the Bank of Germany $12,000,000 less, the Bank of Austria $25,000,000 and the Bank of Spain $2,500,000 more.

WORLD'S FAIR NOTES.

Exhibits by Great Britain.

Sir Henry Trueman Wood, Secretary of the British Commission, has made public particulars of the character and extent of the British exhibit at the fair. The British section, he says, will cover 600,000 square feet, which is the largest space ever occupied by Great Britain at any international exhibition. Two-fifths of the space will be given to the colonies of Great Britain. There will be about 600 exhibitors in the industrial departments of the fair, and great care has been taken to select exhibits which shall give the most adequate illustrations of Great Britain's commerce and art. The allotment of space is divided among the following departments: Agriculture, Electricity, Fisheries, Forestry, Live Stock, Machinery, Manufactures and Liberal Arts, Mines and Mining, Transportation, Fine Arts, and in the Woman's Building.

In the Manufactures Building there will be shown fine specimens of Worcester porcelain, Doulton ware, jewelry, furniture, silks, wall papers, billiard tables, linen and old gold work from Ireland, chemical products, an extensive exhibit of photographs, including work by amateurs, newspapers, scientific instruments, and various educational appliances used by the School Board of London and the Science and Art Department.

In the Transportation Building the Britons will show engines and carriages from various English railways, bicycles, a model of the Forth bridge, carriages and vehicles, and an elaborate display of models of ships sent by the great shipbuilding firms of the United Kingdom. The latter exhibit attracted great attention at the naval exhibit in England, and, it is predicted, will be one of the most popular features of the British contribution to the great show, to view every exhibit in which, Sir Henry Trueman Wood says, will necessitate a walk of 50 miles.

In the Machinery Department a great number of miscellaneous mechanical devices will be in view. Printing and typesetting will be illustrated, there will be looms, spinning frames, steam hammers, three steam engines at work, and specimens of cotton-cleaning machinery.

English electricians, the secretary states, have not contributed so liberally to the electrical section as the Commissioners have desired. The chief British exhibit will be a splendid collection of telegraph apparatus in use in the Post Office Department.

Burdett-Coutts, M.P., will show a model of his stud farm in the Agricultural Building. There will also be a model dairy.

Of England's colonies Canada will hold the premier position, says Sir Henry. Its exhibits will be large in the Agricultural, Mining and Manufactures Building. New South Wales will show timber and merchandise and an enormous trophy of silver taken from the Broken Hill mine. Ceylon will show teas in native stall, with native attendants. India will send specimens of Indian art, silks and other articles. The Indian exhibit, though not decided upon till late, will nevertheless be creditable and interesting. South Africa will send exhibits, noticeable among which will be an illustration of the process of diamond mining, and the samples of clay sent over to show the operation of washing will be selected for their probability of containing diamonds.

Great Britain will have a handsome representation in the Fine Arts section. There will be between 800 and 900 works by some 300 painters who have been chosen out of 1000 applicants. There will be few pictures from the public galleries, but nearly all of the royal academicians will have canvases at the fair. The Queen has lent several pictures which will be sent over. In explanation of the limited number of pictures from public galleries, Sir Henry Wood states that the collections in the National Gallery and at South Kensington are precluded from being lent, a rule which is in contrast to the regulation on this point governing the public collections in France and Germany. These may be drawn upon with the assent of the government, which is not difficult to obtain.

Many of the British exhibits are now on the way to Chicago, and the organization of the section will be begun this month by Sir Henry Trueman Wood in person, assisted by a regular staff. He is confident that the entire exhibit will be complete and ready by May 1.

The Hon. Arthur Renwick, who will represent the New South Wales Commission to the exposition, is now in Chicago and will remain there at least until the exhibit is installed. He makes a stronger claim for New South Wales than Sir Henry Wood, evidently believing that the antipodes will surpass any of Great Britain's nearer colonies. He says:

"Our principal displays will be those of minerals and wool. In the former we expect to beat everything except, perhaps, the display of the United States, and in the latter, the world. Our mining exhibit will include samples of almost every known mineral—gold, silver, coal, iron, copper, tin, lead, zinc, platinum, bismuth, plumbago, manganese, cobalt, mercury in the form of sulphides or cinnabar, magnetite, nickel, &c., in addition to many kinds of precious stones.

"Australia is the second gold producing country and the yield of this metal in the last 40 years has exceeded in value $1,500,000,000. 'The Welcome Stranger,' one of the biggest nuggets ever taken out of a mine, will probably be on exhibition. 'The Welcome Stranger' is a nugget of gold weighing 3040 ounces, found in 1869. It will be the central feature of the exhibit of which it will be a part, and while on exhibition will be guarded by a force of detectives specially detailed for the purpose. We claim and visitors generally concede, that Sydney, our capital, is the best paved city in the world. We had intended originally to lay down a section of a street in Chicago with our wood-blocking but the great cost of carriage militated against this, and we are going to content ourselves by laying down a small section in or outside one of our courts."

Krupp's Big Guns on the Way.

Fried Krupp, the great gunmaker of Germany, has shipped the first consignment of the implements of war to Jackson Park. The bills of lading were received at the Chicago Custom House on the 30th ult. The consignment left Baltimore on January 26, and included six guns, valued at $132,000. While Herr Krupp intends to send later the monster gun of the age, the ones which are now *en route* between Baltimore and Chicago are by no means small. The largest one is approximately 16 inches in diameter and is meant for coast service. There are an 8-inch central pivoting gun, a 16-inch 40 pound quick-firing gun; a 5-inch 40 pound quick-firing gun, and two additional smaller ones. Within a few days the monster gun, the biggest one ever constructed, will be *en route* to Chicago. This one will have a bore of 25 inches in diameter and will weigh about 130 tons. Herr Krupp has manufactured it especially for the World's Fair at the request of Emperor William. A special pavilion is under construction for its reception. In addition to the cannon which will be received there will be a large quantity of packages containing gun carriages, steel armor plates, steel tires, disk wheels, driving wheels, iron cables, plates, tools, &c.

G. Gillhausen and Richard Abe arrived from Germany during the week to take charge of the work of installing the Krupp exhibits.

Roofs Damaged by Snow.

On the 28th ult. considerable damage was done to some of the roofs of the large buildings by accumulations of snow, which formed avalanches under the effect of a heavy rain. The frame work of the roofs was not injured in the least, having been built to withstand almost any strain short of an earthquake. Skylights and glass work suffered, as they could not be braced against such an accident as a snow slide. An erroneous impression has prevailed that the roofs themselves did not bear the weight of the snow. The Manufactures Building is constructed in what might be considered three sections. First there is a main portion 376 feet wide with a towering roof several hundred feet high. On either side of this are annexes or naves, much lower, 175 feet wide. It was on the great hight of the main roof that the snow accumulated. There are at least 16 acres of space there, and the great fall of snow in the last few weeks steadily accumulated. When the mild weather came on, accompanied by rain, the 16 acres of snow became saturated with moisture. As the rain continued the burden became heavier, and finally the great mass of wet snow slipped from its moorings and started on the down grade. For 200 feet it had a clear track and acquired a great momentum. Then it had a clear jump of 50 feet to the glass roof below. Thither it fell and crashed everything before it. The curve in the main roof gave even a greater fall, and apparently the snow left its base of support on reaching this curve and made a sheer jump of nearly 100 feet. Of course nothing in the way of the ordinary roof structure could withstand the shock. But to repair damages will only cost $5000, which proves that it was not a very serious matter. The injury to other roofs was of the same character but even less serious.

The Boiler Controversy.

The Babcock & Wilcox Company have won the first stage in their suit against the Exposition Company, in which they claim the right to place their boilers in the space lately granted by the exposition management to the Stirling Boiler Company. This case was referred for a preliminary hearing to a master in chancery, who reported to the court on the 1st inst. in favor of the Babcock & Wilcox Company. The case will now be fought before the court, but even if the decision is then in favor of the Babcock & Wilcox Company the matter will not then be closed, as the Stirling Company will insist that they have an actual contract for the space in dispute, which should take precedence over an allotment by the chief of a department. The contest between these boiler manufacturers is exciting no little interest in the trade, as it evidently means much more than the mere desire to exhibit specimens of a few boilers at the World's Fair.

Miscellaneous

An engine built by James Watt, Lancashire, England, in 1815, is to be exhibited in the Department of Transportation The owners, John Rourke & Son of Savannah, Ga., will make the exhibit. The firm have been using this old engine since the time of its construction.

The Western Union Telegraph Company has shipped a model of the famous steamship "Great Eastern," which laid the Atlantic cable. It is valued at $5,000.

Pittsburgh's assessed valuation increased last year $13,000,000.

TIN PLATES.

American Tin-Plate Brands.

III.

Herewith we print a further installment of the information collected in respect to brands, trade-marks, &c., of manufacturers of American tin and terne plates. We hope to complete the list in a fourth notice, as there are yet a few makers whose reports have not reached us in time for incorporation in the present article:

John Hamilton,

Pittsburgh, Pa., is devoting his attention to the production of high-grade American roofing plates, of which three qualities are turned out at his works, branded as follows:

1. "*Hamilton's Best Re-Dipped.*"—An old-style terne, made of best American soft steel, coated by hand by the pure palm-oil process. Redipped by hand and thoroughly assorted. Each sheet bears a very heavy and smooth coating, and is resquared. These plates are made of standard sizes, IC and IX, and are stamped with name and gauge, as in Fig. 1. Boxes are marked with name, size and gauge.

Fig. 1.—"Hamilton's Best Re-Dipped" Stamp. John Hamilton.

2. "*Osceola.*"—Second grade of old-style plate, made in similar way to "Hamilton's Best," but the coating is not quite so heavy. Sizes 14 x 20 and 20 x 28, IC and IX. Each sheet is resquared and stamped with name and gauge. (See Fig. 2).

Fig. 2.—"Osceola" Stamp. John Hamilton.

3. "*Lulu.*"—High grade rolled plate, with medium coating. Coated by palm oil process. Made in 20 x 28 sheets, IC and IX. Sheets are stamped with name, as shown in Fig. 3.

Fig. 3.—"Lulu" Stamp. John Hamilton

Merchant & Co.,

Philadelphia, Pa., are turning out an extensive line of American tin and terne plates of superior quality. The roofing sheets produced by this concern include the following brands, all made in IC and IX, 14 x 20 and 20 x 28:

1. "*Merchant's Old Method.*"—A guaranteed hand-dipped plate, bearing a very heavy coating. All plates are resquared, and stamped with name of brand and thickness. (See Fig. 4). Boxes containing these and all of Merchant & Co.'s terne plates are marked on one end with the name of brand and gauge in plain letters. The side of every terne-plate box invariably bears the words "M. & CO. AMERICAN COATED TERNE."

Fig. 4.—"Merchant's Old Method" Stamp. Merchant & Company.

2. "*Merchant's Roofing.*"—An extra heavily coated hand-dipped plate, carefully assorted. Each sheet is stamped with name and gauge, as illustrated in Fig. 5.

Fig. 5.—"Merchant's Roofing" Stamp. Merchant & Company.

3. "*Alaska.*"—Heavy coated patent rolled plate. Sheets stamped as shown in Fig. 6.

Fig. 6.—"Alaska" Stamp. Merchant & Company.

The three brands above detailed are all guaranteed plates, made by palm oil process. No wasters are sold.

4. "*Special Extra Coated.*"—A heavily coated plate, made by palm-oil process, but not guaranteed.

These plates are recommended for general work where a heavy coating is desired. Each sheet is stamped with brand, name and gauge, as shown in Fig. 7.

Fig. 7.—"Special" Stamp. Merchant & Company.

5. "*Hickory.*"—Good quality terne plate, claimed to be better than "Emlyn" or "Melyn" grade of roofing plates. Dull finish. Sheets stamped as in Fig. 8.

Fig. 8.—"Hickory" Stamp. Merchant & Company.

6. "*Empire.*"—Good quality terne. Equal, it is said, to "Worcester." All sheets stamped with name, &c., in the usual manner (see Fig. 9).

Fig. 9.—"Empire" Stamp. Merchant & Company.

7. "*Crescent.*"—Good quality cheap terne, bright finish, equal, it is said, to "Dean" grade. Sheets stamped as in Fig. 10.

Fig. 10.—"Crescent" Stamp. Merchant & Company.

8. "*Palm.*"—Ordinary cheap terne plate, dark finish. Stamped as shown in Fig. 11.

Fig. 11.—"Palm" Stamp. Merchant & Company.

9. "*Arch.*"—Ordinary cheap grade terne, bright finish. Stamped as in Fig. 12.

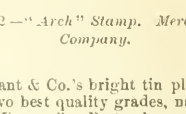

Fig. 12.—"Arch" Stamp. Merchant & Company.

Merchant & Co.'s bright tin plates consist of two best quality grades, namely:

1. "*Minerva.*"—Best charcoal plate, "Allaway" grade; made in IC, IX and IXX thicknesses, 14 x 20 and 20 x 28. Boxes containing these plates are marked plainly on one end with name of brand and gauge, and on the side "M. & CO. AMERICAN COATED TIN."

2. "*Florence.*"—Best charcoal plate. "Melyn" grade; made of standard sizes.

IC, IX, IXX and IXXX. Boxes are marked as in the case of "Minerva," substituting brand name on the end.

A. A. Thompson & Co.,

New York. This firm are now producing four qualities of American terne plates, IC and IX gauge, 14 x 20 and 20 x 28. All plates are coated by palm-oil process.

1. "*Old Colony.*"—An extra heavily coated, redipped, roofing plate, stated to be superior to "M.F." Each plate is stamped with name of brand, as shown in Fig. 13. The boxes are stenciled on the end with name "OLD COLONY," and gauge, and on the side with the words "MADE BY A. A. T. & CO., N. Y."

OLD COLONY

Fig. 13.—"Old Colony" Stamp. A. A. Thompson & Company.

2. "*Durham Old Style.*"—Is, as its name denotes, an old-style plate, bearing a very heavy coating; claimed to be equal to "M.F." Every plate stamped with name of brand, as Fig. 14. Boxes bear on the ends the word "DURHAM," with "IC" or "IX," according to gauge, and are stenciled similarly on the side to those containing "Old Colony" plates.

DURHAM
OLD STYLE

Fig. 14.—"Durham Old Style" Stamp. A. A. Thompson & Company.

3. "*Puritan.*"—Heavily coated. Sheets stamped with name of brand, as in Fig. 15. Box marks are similar to those detailed for other brands, excepting the name "PURITAN," which is stenciled on end.

PURITAN

Fig. 15.—"Puritan" Stamp. A. A. Thompson & Company.

4. "*Central.*"—Medium coated. Sheets have been unstamped hitherto, but will in future bear the name of the brand, as in the case of other qualities. Box marks similar to those above mentioned.

All these plates are made of best Siemens-Martin steel sheets.

Freights on Tin Plate.

Chairman Midgely of the Western Freight Association, Chicago, has issued a ruling in regard to the use of proportional rates on imported tin plate. Some time ago a rate of 12½ cents a hundred pounds from Mississippi River crossings to Southwestern Missouri River points on tin plate shipments via Newport News and Baltimore was authorized on the application of the Kanawha Dispatch and the Continental line, addressed to the Chicago & Alton road. The latter road had acquired the right to make the rate by a notice duly filed and acted upon. Subsequently the Grand Trunk applied for the use of the same rate in connection with the shipments via Portland, Maine, and Montreal, and the authority was granted. Then the Rock Island requested the privilege of making the same proportional rate on tin plate consigned to Omaha and Council Bluffs. The authority was given, but restricted to imports via Newport News and Baltimore. It afterward was learned that the other lines were applying the rate on offerings at Mississippi River crossings destined to Missouri River points when imported via Philadelphia. Consequently a ruling was asked for.

In deciding the question, Chairman Midgely says that the proportional rate of 12½ cents may be used on deliveries of tin plate imported via any Atlantic port on the written application of the initial seaboard line. Inasmuch as the Kanawha Dispatch and the Continental line are at liberty to quote rates at their discretion to East St. Louis on shipments destined beyond, other lines from the seaboard should be equally free to quote rates from their seaports to the Mississippi River crossings. In case they should do so, Chairman Midgely decides that lines in the Western Freight Association may accept their agreed proportions of such published proportional rates on tin-plate shipments destined to the Missouri River and beyond. This rule is effective from and after February 6.

Blairsville Rolling Mill & Tin Plate Company's Plant.

James B. Scott & Co., Pittsburgh, Pa., make announcement that they are sole factors for the Blairsville Rolling Mill & Tin Plate Company of Blairsville, Pa., whose plant is now in active operation; and that they will in future control the entire output of that concern.

The Blairsville Rolling Mill & Tin Plate Company are operating a complete plant, consisting of hot and cold rolling mills, heating and annealing furnaces, pickling department and tin houses provided with machinery for coating plates. The black sheets turned out are stated to be of excellent quality, well cold rolled and annealed, and presenting a handsome finish. A portion of the output is used in the manufacture of tin and terne plates on the spot, the remainder being disposed of to other concerns for coating purposes.

The plant is located very advantageously at Blairsville on the line of the Pennsylvania Railroad, from which it has its own private siding. Being also on the banks of the Conemaugh River, the facilities for water and fuel supplies are excellent. A large acreage surrounding the works is owned by the company, facilitating any extensions of plant that it may be found necessary to make to meet increasing business in the future.

BRITISH BOARD OF TRADE returns for the year 1892 show a material falling off in the exports of tin and terne plates from Great Britain during the 12 months ending December 31, 1892. The reduction in the case of shipments to the United States amounts to 46,664 tons, as compared with the figures for the previous year. These are given in the return as follows: 1891, 325,143 tons, valued at $26,000,000; 1892, 278,479 tons, valued at $18,500,000. These totals show a more considerable percentage of decline in the value of exports of tin plates than in their volume, which is, nevertheless, very great, comparing unfavorably with any year since 1887. It should be stated that the decrease in British tin-plate shipments for 1892 has not been peculiar to this country, but has been almost uniform to all foreign countries. The total volume of exports of this material from Great Britain, we learn, decreased last year 11.7 per cent. from those of 1891, and their value fell off 25.5 per cent. for the same period.

A. L. Burtis, Lockport, N. Y., has brought out in card form for tinners' use the elbow chart that was illustrated and described in *The Metal Worker* of December 31. The card, measuring 14 x 11 inches, has on it the elbow chart and also the quadrant chart for giving intermediate points for exact work. The elbow chart, it will be remembered, gives directly the rise of the miter line for elbows of any diameter and number of pieces and for any angle, so that for quick work the pattern can be sketched in. With the chart is issued an illustrated and descriptive circular explaining the application, with a practical example of its use. A neat feature of the chart itself is a silk thread fastened in one corner, by means of which the hight of the miter lines can be determined, the thread taking the place of the rule. The price of this chart is 50 cents.

Reception to the New York Trade School Students.

The very cordial welcome extended to the students of the New York Trade School, at the reception given them on Monday evening, February 6, by the Management Committee and members of the Twenty-third street Young Men's Christian Association, was truly appreciated. The students wore in the coat button hole the school color—royal purple, and the Association members their color—blue. An informal programme made everything easy and delightful for the student body, and they enjoyed the music and visiting the different well-arranged departments, as well as the refreshments that were served. The address of welcome by Alfred E. Marling was full of earnest, suggestive thought and most happily made. J. Stanly Thomas of the Trade School responded in behalf of the students. The Association members who helped make this entertainment such a pleasant success may always have a consciousness of gratitude from the Trade School students.

Henry C. Earle of New York City has patented a gas water heater, so constructed that only a portion of the entire volume of water receives all the heat of the gas flame for the purpose of very quickly vaporizing the water, and thus rapidly heating the radiator, which is connected with the heater. The water reservoirs are so arranged as to gradually feed the heater, as the water is evaporated therefrom, by maintaining the water level in the heater always constant. In order to do away with a cumbersome and complicated system of valves, the heater and reservoirs are so formed that they constitute one continuous series, the reservoirs discharging water from one into the other and thence into the heater. The latter is so situated as to be directly exposed to the burner flame, while the reservoirs are not exposed to it. This, the inventor claims, is effected by organizing the whole as a pipe coil, whereof one leaf or length constitutes the heater and the others the water reservoirs. The heater length is placed about one-half its diameter above the water reservoir lengths, which are on a level with each other. The steam supply pipe is connected with the heater length and the water of condensation ultimately returns to one of the water reservoirs. Between the latter and the burner is placed a shield or deflector having perforations for the purpose of admitting air to the burner. The patentee claims that by this arrangement the flames of a burner are concentrated upon the heater length of the coil, and the first evaporation reduces the water level in that length to the top of the hot-water reservoir. By this operation a space is left in the top of the heater to act as a steam space and to facilitate the ready development of steam. It is claimed that the water level in the heater can never fall lower, because, as rapidly as evaporation takes place water enters the heater from the reservoirs, and since the condensation returns to the reservoirs no waste occurs except a little from the air valve or pet cock when the radiator is first being heated.

PLUMBING AND GAS FITTING.

Bursting Pipes by Frost.

BY LEICESTER ALLEN.

There are some rather mysterious circumstances attending the bursting of pipes in cold weather, or, perhaps, I should more properly say, conditions believed not to be generally understood by the plumbing fraternity, which it is the purpose of this article first to explain, and, second, to point the way to some precaution whereby frozen pipes may be prevented from bursting while thawing them out, an accident that often happens even when the act of freezing has not strained the pipes to the limit of their strength.

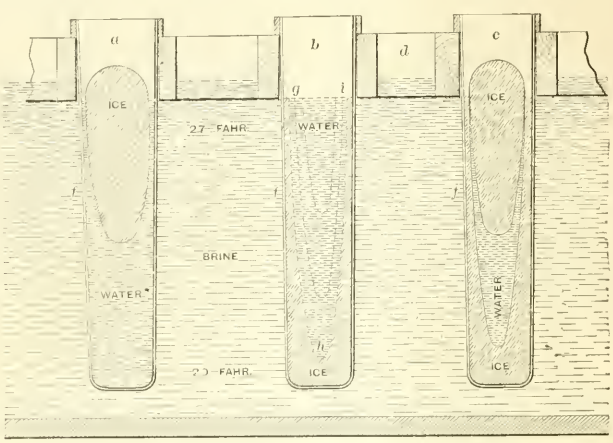
My attention was first strongly directed to the subject by an occurrence which I will briefly narrate. In an ice-making plant of a capacity to turn out about 3 tons of ice in 24 hours, a set of ice cans or molds made of heavy galvanized iron and which had been used many times without any apparent injury, one day, while charged with water and placed in the cold brine for freezing as usual, were found to have burst. There was not a single exception; every one of the molds had given way at some point below the level of the brine in the tank. This accident was so extraordinary that an investigation to find the cause was instituted, and, among others, I was consulted. I was, perhaps, better qualified to give an opinion than some of the engineers who made an examination of the cans; not because of greater learning, but because I happened to know something of the conditions under which the plant had been working, which they did not.

The plant, as I knew, having been erected for exhibition purposes, was not regularly and continuously operated in the usual manner of ice making; but was started up and worked whenever, for the purpose of making a sale or for other business reason, it was desired to show it in operation.

On the occasion of the accident to the ice molds the superintendent gave orders to the man in charge of the ice machine, as usual on such occasions, informing him that an appointment had been made with some expected customers to show them the plant in operation, and directing him to refill the ice molds and start up at an hour named, so that everything might be in normal working condition when the expected visitors should arrive. The order was obeyed as given, with the single exception that the attendant, instead of refilling the molds as directed, left them as he found them in the tank, already filled as they had been at a previous exhibition. The molds, which at the last running had been frozen full of ice, were found to have still some ice in them, and the attendant, representing to the superintendent that the water in the molds was pure, obtained permission to start up the machine without again filling them, as emptying and refilling them involved considerable labor.

The machine having been started at the time appointed, everything appeared to go on well until beginning to take the ice from the molds, when each mold as it was taken out was found to be burst as above stated.

I cross questioned the attendant minutely about the condition of affairs when he started up the machine, and finally elicited the fact that in each mold, floating at the top of the water therein, there was a loose chunk of ice, and that at the sides of this chunk there was a space of from $\frac{1}{4}$ to $\frac{3}{8}$ inch between the ice chunk and the metal of the mold. As this fact gave me the clue sought as to the cause of the bursting, and as it leads directly to the explanation of the bursting of pipes under peculiar circumstances, I have illustrated the condition of affairs in Fig. 1, in which is shown a longitudinal vertical section, *a*, of the ice mold as it was when the ice machine was started up, a similar section, *b*, of a mold in the ordinary process of freezing, illustrating various stages of ice formation therein, and, *c*, the peculiar condition of things that resulted in bursting the molds.



Bursting Pipes by Frost.—Fig. 1.—Section through Ice Molds.

In the illustration, *d* is the timber framework which supports the molds in the brine in the freezing tank. The brine may be assumed to have at and near the bottom a temperature of 20° F., or 12° below the freezing point, and in the upper part a temperature of 27° F. In actual practice the brine is often maintained at a temperature 6 or 7 degrees lower than this.

The galvanized iron molds *f* transmit heat from their contained water to and into the colder brine, first bringing the water down to the freezing temperature and then freezing it. The ice at first forms faster in the lower part of the mold, as shown in the mold marked *b*, and thus the water, after the freezing begins, is always contained in a cavity in the ice which is open at the top, but which has a shape at an early stage of the freezing, as shown at *g h i*, the curve being very much such as would be obtained by holding a string one end at *g* and the other at *i*, and letting the middle part hang down to *h*. In later stages of freezing the yet unfrozen water lies in cavities still open at the top and having shapes indicated by the dotted outlines; and this goes on, the cavities getting smaller and smaller, till at last they disappear entirely and the cake of ice is ready to be taken out.

Now, when starting up the machine and commencing to circulate cold brine in the tank around the cans or molds in the case cited, each mold had a cake of ice in it of form somewhat as shown in the mold marked *a*, and which, floating in the water, because ice is lighter than water, bulk for bulk, protruded some inches above the water in the mold. When the freezing in the molds again commenced, ice formed in the molds exactly as described and illustrated in the mold *b*, and soon brought about the condition illustrated in the mold marked *c*. The yet unfrozen water became sealed up in a cavity instead of lying in a cavity open at the top, the ice forming from the bottom upward, along the sides of the mold, uniting with the floating chunk; and shortly after this the cans burst, because the freezing of the inclosed water expanded it, and, as it could not expand upward, its expansive force was exerted against the sides of the molds. These not being able to change their form, being packed full of a practically inelastic substance, the thick ice shell had to give way under the strain as they did, each at some point weaker than other parts of the mold.

Now, this dearly bought experience lights the way to general principles that were verified by later experiments, which will presently be described.

There is a critical point in the temperature of water at which either heating or cooling will cause it to expand with great force, and if at this temperature water be confined in a pipe or vessel already strained by pressure to nearly its limit of strength, this limit may be passed easily either by cooling further or by warming the confined water. In probably nine out of every ten instances of the bursting of water pipes it is this action that causes the break.

Having framed this theory by reflection upon the bursting of the ice molds above described, I was not content to accept it without practical proof. I therefore proceeded to test the truth or falsity of the reasoning by the experiments described below.

The critical temperature at which water expands, either by cooling it or warming it, is almost exactly 4° C. or 39.2° F. Contracting by cooling till it reaches this temperature, further cooling causes it to expand again slowly till 32° F. is reached. At this point, while the water is freezing, a much more remarkable expansion occurs. While the water remains under ordinary atmospheric pressure its temperature remains unchanged while freezing, standing constantly at 32° F. till the water is finally formed into ice; but in taking on the condition of ice it expands about 7 per cent. of its volume at the freezing point. If, however, in a strong pipe or vessel the freezing progresses gradually in any given direction, in a space open at one end, the expansion will always take that direction, as it does in the ice molds, where, as shown in Fig. 1, at *b*, the freezing progresses from the bottom toward the top, and the sides of the mold receive no undue strain, the expansion in freezing taking the direction of least resistance—in this case the upward direction. If, now, these molds be intentionally or unintentionally sealed at the top, as happened in the case above cited, and thus make the resistance in the upward direction greater than in some other direction, bursting results.

When a bucket or other vessel of water is set out in the open air in freezing weather it freezes at the top first, and unless the vessel is unusually strong up

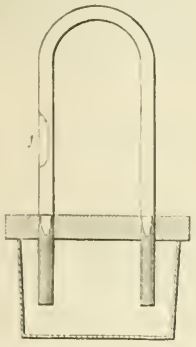


Fig. 2.—Experiments with Glass Tubes.

ward expansion meets a greater resistance than expansion in other directions, after the ice has become 3 or 4 inches thick at the top. A weak vessel under such conditions always bursts. If the vessel be strong the expansion of the water below the layer of ice first formed at the top forces this layer upward, and the vessel is saved from bursting in this way. In such a case, after the water is all frozen, the middle of the upper surface of the cake of ice will be found much above the level at the margin, showing that this surface was upheaved in the act of freezing.

We have reached, then, this principle, that if the freezing progress in an inclosed space (for instance, an iron pipe) in either direction toward unfrozen water, and this unfrozen water is free to move away as the ice (expanding while freezing) encroaches upon the space, the pipe, unless unduly weak, will not burst.

Suppose such a strong pipe leading to a faucet to be frozen at a point not very distant from the faucet. The pipe may be burst if the faucet be tightly closed, or saved if the faucet leak a little. If the ice plug be at considerable distance from the faucet and the freezing do not extend very far, the elasticity of the metal may save the pipe even if the faucet be tightly closed. But now suppose another state of things. Water has been drawn through the faucet in cold weather at, say, a temperature of 42° F. (very near to the critical temperature above named). The pipe and the water will take the same temperature. The water can contract only a very little more. Very cold air is flowing through a crevice upon this pipe at some distance from the faucet, which we will now suppose to be suddenly and tightly closed. Circulation of water is thus stopped, and the contained water at the point where the cold air is blowing upon the pipe is frozen in perhaps three minutes. The pipe being a good conductor, permits the formation of ice perhaps a foot or more on each side of the point where the cold air strikes. On the side of this point, toward the water main, the water is pushed backward by the expansion of the ice, and it will never burst on that side, unless somewhere further along a second ice-plug has been simultaneously formed, which stops the movement of the water in that direction. On the faucet side there is no relief from the fast accumulating pressure. The pipe will burst unless the elasticity of the small quantity of air always contained in water that has been exposed to air and the added elasticity of the metal due to the length of the pipe from the ice plug to the faucet are sufficient to save it.

Now, make another supposition. Two ice plugs have formed in a pipe, say at a distance 1 or 2 feet apart, yet the pipe has not burst. It is proposed to thaw out the pipe, and to this end cloths wet with hot water are wrapped about it as nearly upon the frozen part as the judgment of the operator can locate the spot. The cloths get on the pipe between the two plugs. The pipe bursts. Why? The space between the plugs is filled with water at its maximum density, and the pipe is already under a strain almost to the limit of its strength, through pressure upon the confined water caused by the expansion of the ice in freezing, the space being thus encroached upon by the ice plugs respectively from opposite directions. Heating the confined water immediately expands it, the ice plugs remain firm and the pipe has to yield.

Suppose the cloths are placed on the pipe between the faucet and the nearest ice plug without opening the faucet, and suppose the faucet to be tight and the distance of the plug from the faucet is small, the pipe may and will probably be forced open between the plug and the faucet.

Again, suppose the cloths to be placed between the ice plug most distant from the faucet and the water main; no amount of heating at this point will now burst the pipe.

It follows that to thaw out ice plugs in pipes with entire safety to the pipes, assuming that the pipes have not already been burst while freezing, that the ice plug nearest the main should be the first attacked, and it should be attacked at the end nearest the main.

A light hammer tapped upon the pipe will locate the ice plugs by the difference of sound emitted in the same way as studs are located by taps on a plastered wall. Of course, the difference in the sound cannot be described in words; the ear must be educated to detect it by practice.

It has been denied that pipes can be burst in thawing them out. I think the following experiments decide this point conclusively. It must, however, be borne in mind that the precise moment at which a crack forms in a pipe is very difficult to determine. The pressure increases so slowly in freezing that there is no sound emitted, as in an explosion, when the crack begins to form, except in the case of glass tubes, in which, if the ear is attentive, a sharp but not loud click may be perceived. Usually the first indication is a small leak, which rapidly increases as the rupture extends along the metal.

Fig. 2 illustrates an experiment several times repeated with a glass tube. The tube, bent into the form shown, had one of its open ends stopped with a ground glass stopper and the leg so stopped was partly filled with water. Both legs being passed through a wooden cover into a vessel containing brine cooled to about 20° F. by a freezing mixture of ice and snow packed around the vessel, the tube was gradually shoved deeper and deeper into the brine until an ice plug of from 3 to 4 inches in length formed in the leg containing water. The experiment being performed in a temperature of 40° F., the water put into the tube was very nearly at its maximum density, or very close to the critical temperature above alluded to. When water was placed in one leg of the tube only, the tube could be gradually shoved in to the very bottom of the freezing vessel without breaking it. When the tube was completely filled with water and both ends stopped with ground glass stoppers, the tube was invariably burst, and only once did the fracture occur in the part where the ice plugs, one in each end of the tube, formed. I broke about a dozen of these tubes in this way, the fractures occurring in various places, presumably weaker parts. One of these fractures, drawn as nearly as I can remember its form, is shown at *f* in Fig. 2. The shape of the upper surface of the ice plugs was concave, as shown, this form being analogous to the formation of ice in the ice-mold *h* in Fig. 1.

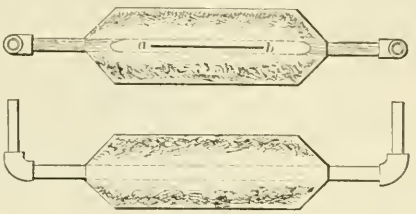

Fig. 3.—Experiments with Iron Pipes.

Not yet satisfied, I repeated the latter experiment with one-inch iron pipe, fitted with elbows and nipples as shown in Fig. 3, stopping the open ends with rubber corks and introducing the nipples downward into separate freezing baths till ice plugs formed in them. With nipples 1 foot long I could burst an intermediate pipe 4 feet long, the water in the intermediate part remaining liquid. This was repeated six or eight times. When an ice plug was formed in one of the nipples, the other remaining corked, the expansion of the ice in freezing would force out the cork from the unfrozen nipple and water would flow out. No exception to this action took place.

By timing the act of freezing and measuring the length of the ice plugs formed, which could be done by screwing out the nipples, I found I could form plugs of

approximately any length desired, and could also determine the mean length of the plugs necessary to burst the intermediate pipe. Unfortunately, I am unable to find my notes of these experiments, and am hence unable to give these lengths, but by this means I was enabled to freeze plugs that, while they would put the intermediate pipes under considerable strain, approaching the bursting strain, still would not actually burst them. After thus testing I wrapped the intermediate pipe with very porous sacking, as shown in Fig. 3, and froze plugs that would generate a strain almost to the limit of strength in the intermediate pipe. I then poured boiling water upon the wrapping. In every case the pipe burst at some point between the ice plugs.

By unscrewing the nipples, corking one end of the intermediate pipe length and freezing a plug in the corked end, then, with the remaining space filled with water and corked, freezing a plug in the other end of the pipe, the pipe has invariably burst, the bursting taking place whether in freezing or in applying hot water to the sacking in the same way as before, always between the ice plugs. One of the cracks thus opened is indicated at *a h* in Fig 3, and it occurred while freezing the second plug. The drawing exaggerates the length of the split; it was only about 4 inches long.

These experiments satisfy me, that beginning at the stopped end and gradually freezing water from end to end in a pipe, one end of which is plugged and the other left open, and thawing it out again from the open end toward the plugged end, the pipe never could be burst either in freezing or thawing out, though the process might be repeated a thousand times, and that the real danger arises from the confinement of water between an ice plug and a stopped end, or between two or more ice plugs.

I did not experiment with lead pipes, and perhaps very different results might be obtained with a material so malleable as lead, and having so little tensile strength as compared with iron. Yet even with lead pipes I am inclined to think the same principles will produce similar or, at least, analogous results. Any expansion that materially enlarges the bore of a lead pipe of course weakens it very much at the enlarged part, and it is possible that (unless very thick) lead would not afford sufficient resistance to prevent the ice from expanding in all directions while forming.

Effect of Curves in Supply Pipes.

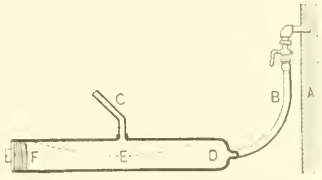
From J. P., *Covington, Ky.*—I fitted up an old school building last summer to which an additional wing had been built on each of the three floors, in which a water closet had been placed. The tank from which the water supply for these new fixtures as well as the old closets is drawn is located in the old part of the building under the roof, and is only 3 feet in depth, the bottom of the tank being on a level with the top of the water-closet cistern belonging to the newly set water closet on the top floor in the new wing. A 2-inch galvanized pipe carries the water from the tank to the water-closet cistern, a distance of about 90 feet, along the halls and passages and one of the classrooms. The supply, however, is very inadequate, hardly sufficient to do more than trickle through the flush run, particularly during teaching hours, when the closets are used in quick succession. As this is the first job of any great extent I put out of my hands since I started in business for myself it has bothered me how to remedy the defects. If I could have run a separate line of supply pipe in the new part of the building it might be the better way, but this would have involved the purchase of another pump and my contract was too close to warrant the expense. The trustees are not satisfied and are willing to pay for such improvements as I can show to be necessary. Can you help me with an idea from what I have written of the job.

Answer.—The trouble with the water supply in the new portion of the building is, in our opinion, mainly attributable to the fact that the water has to be carried a distance of 90 feet, the line of pipes being necessarily full of sharp bends consequent on its having to be run along the walls of the hallways and classrooms. As every bend increases the friction and lessens the force of the flow through the pipes, it is not to be wondered at that when a stream starts under a 3-foot pressure the force is well-nigh spent before it reaches the first water closet. The remedy we would suggest is that, instead of carrying the 2-inch pipe along the top floor through hallways and rooms, the pipe be carried down into the cellar, thence along the ceiling in the most direct line possible to the new wing and then up to the top floor along the line of the soil pipe. This would remove the friction, furnish the necessary pressure and leave the closets free for constant use and with all the speedy flush required. In so far that the water-closet cistern on the top floor of the new wing is below the supply tank in the old part of the building there need be no fear that the water will not rise sufficiently high to supply the cistern. Water will always, if permitted, rise to its own level. If the use of the cellar is possible we think the plan we suggest will work satisfactorily.

Fungus Growth in Water Pipes.

From W. A. J., *Philadelphia, Pa.*—I noticed in *The Metal Worker* of the 28th ult. some statements relative to the experience of a New York plumber with fungus growth in water pipes. It is difficult to comprehend how the "snake grass," so called, could get through the gate valve or stop cock in the main in the cellar, and it would be interesting to know exactly how it was kept out of the service pipes in the house. Cannot Mr. Reynolds enlighten the craft on this point? Has his been the only experience in that line in New York City?

Answer.—Thus far we have not heard of any other New York plumber experiencing



Fungus Growth in Water Pipes.—Fig. 1.—Remedy Employed.

the difficulty which Mr. Reynolds had to overcome. The device which he employed is represented in Fig. 1 of the appended diagrams, Figs. 2 and 3 being the means suggested by other plumbers who, with the modesty characteristic of the craft, keep in the background.

The remedy illustrated in Fig. 1 will be readily understood, and in practice has been found by Mr. Reynolds to work satisfactorily. The water enters the reservoir, which consists of a piece of 4-inch lead pipe, about 2½ feet in length, at the right hand end from the street main B, and passing up through the perforated diaphragm E, is distributed through service pipe, C, to all the fixtures. Should the perforations in E become choked up, the hand hole fitted with cleaning screw, F, is opened and

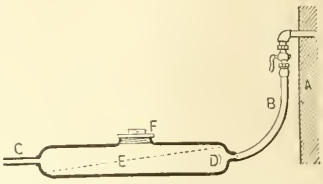


Fig. 2.—A Second Remedy Suggested.

the obstructions blown out, after which a brush may be passed under the perforations, when the cleaning screw F is again inserted in place.

In Fig. 2 the water enters the reservoir D from Croton pipe, B, and after filling up same is discharged through the service pipe C. A perforated diaphragm, E, extends diagonally across the reservoir, acting as a strainer to the water before it enters the

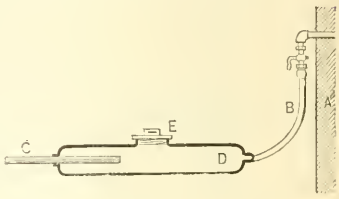

Fig. 3.—A Third Remedy Suggested.

service pipe C, while the hand hole and cleaning screw F is intended to permit the removal of fungus or other obstructions. This arrangement does not appear to be as well adapted for the purpose as Fig. 1, because there is no provision for the removal of obstructions from the section of the reservoir below the diaphragm E otherwise than by the detachment of the Croton pipe B at the point of connection with reservoir, D. In Fig. 3 we have no diaphragm. The water enters the reservoir D in the same manner, until the latter is full, when the discharge takes place through the service pipe C, which extends about half way through the reservoir. It is claimed for this device that the fungus matter, being light, will float on the surface or highest level of the water and can readily be removed through the hand hole E, while the house water supply is taken from the center of the body of water in the reservoir. Mr. Reynolds, however good the others may be, claims that his device "fills the bill," and considers that he has solved the problem of how to get over the difficulty in the simplest and most practical manner. It should here be noted that in the three

diagrams the Croton pipe B should be understood as lead pipe, notwithstanding the apparent joint inadvertently made at the bend inside front wall.

The New York Plumbing Examining Board.

After patient waiting the New York Master Plumbers have their desires gratified by the appointment by Mayor Gilroy on the 7th inst. of the members of the Examining Board of Plumbers, as follows: For the one year term, Joseph W. O'Brien, master plumber, 154 Spring street. For the two year, term Michael Ryan, master plumber, 1000 Sixth avenue. For the three year term John McKenna, journeyman plumber, 340 East Fifty-Third street. These, with Col. George D. Scott, Chief Inspector of Plumbing in the Building Department, and Chief Engineer of Sewers Loomis of the Department of Public Works, constitute the first Examining Board for New York City under the law known as Chap. 620 of the Laws of 1892. Considering the large number of master plumbers doing business in this city for years, who must at least go through the form of an examination and have a new license issued, and of the many journeymen who may be desirous of joining the ranks of the master plumbers, it will be pretty close work to have the work completed in conformity with the act by the first of March—only three weeks distant from the date of appointment. The respective terms of the plumbers appointed on the board will date from December 31, 1893.

St. Paul Master Plumbers.

The annual election of officers of the Master Plumbers' Association of St. Paul, Minn., which was held in January, resulted as follows:

President, John McDonough.
First vice president, J. F. McQuillan.
Second vice president, George Dempsey.
Secretary, H. S Krauze.
Treasurer, George A. Kees.
Sergeant at arms, J. F. Holmes.

The Board of Directors elected consists of Messrs. Adamson, Shea, Hudner and Culliton.

The New York Master Plumbers' Annual Ball.

From N. Y. P., *New York.*—The communication of "G. T. M." in *The Metal Worker* of the 4th inst. might mislead outsiders into the belief that there was a lack of harmony in the New York association. Nothing could be further from the truth, and the best proof of it may be found in the success which attended the annual ball of the association, which came off on the 17th ult. at the Central Opera House, East Sixty-seventh street. On the different committees the names of the sympathizers of the rivals for Presidential honors worked hand-in-hand for the general comfort and enjoyment of their guests, included among whom were members of the Brooklyn Master Plumbers' Association and representatives of the various supply houses in New York. The Reception Committee, composed of Chairman John Byrns and 46 members, and the Floor Committee, officered by Chairman James Corbett and a like number of aids, co-operated to make the event the most successful ball yet given by the master plumbers.

It is generally known that James B. Clow & Son, manufacturers and dealers in plumbers' supplies, &c., Lake and Franklin streets, Chicago, control the advertising space in the various toilet rooms connected with the World's Fair buildings. W. E. Clow has returned from a trip to New York, where he has been arranging to send agents to England, France and Germany to solicit advertisements for the above mentioned advertising space.

TRAPS AND VENTS.

The Bronson Plumbing & Heating Company of Hornellsville, N. Y., have been succeeded by the Babcock Plumbing & Heating Company. The new element infused into the concern is furnished by F. G. Babcock, C. C. Babcock, F. G. Babcock, Jr., Blake B. Babcok and George A. Bronson. The new concern start off under the most favorable auspices. They will at once increase their facilities and field of operation. They will do a wholesale business in their line. The present stand will be retained, but will be overhauled for the purpose of adding to the firm's conveniences.

The J. L. Mott Iron Works, manufacturers and importers of plumbing and sanitary material, 311-313 Wabash avenue, Chicago, furnished the Mexican onyx lavatories, &c., for the Mormon Temple at Salt Lake City. The slabs for these lavatories were 1¼ inches thick. Midgley & Sons Company of Salt Lake City did the plumbing. This temple, which was begun in 1853, is just being finished.

James B. Clow & Son, manufacturers and dealers in brass goods for plumbers, steam engine builders, gas and steam fitters, &c., Lake and Franklin streets, Chicago, have secured the agency for, and will represent entirely in that market, the sewer pipe manufactured by Robinson Bros. & Co., Akron, Ohio. The firm have yards at Englewood, Ill., and on Ogden avenue near Belt Line Railroad, where a large stock of pipe will be kept on hand. A number of large orders have already been received for pipe.

The New York Master Plumbers intend in the near future to present Colonel Geo. D. Scott, at present chief inspector of plumbing in the Building Department, with a life-size portrait of himself, as a mark of appreciation and of the esteem in which he is held by his associates. A meeting of those interested in the movement was held on the 27th ult.

James B. Clow & Son, Lake and Franklin streets, Chicago, have issued a very fine catalogue of cast-iron pipe and general water works supplies. The form of this catalogue is peculiar. The page is 7¼ x 13½ inches and the leaves are bound together at the top in the style of legal documents, while the paper is printed on one side only. The cover is of pale blue thin paper, and the ink used is dark blue. The paper is highly calendered. The contents comprise cast iron water pipe and gas pipe of standard sizes, specials of all descriptions for connections, flexible or ball pipe joints, drip boxes, manhole covers, curb grates and pans, Eddy hub end gate valves, special gate valves, standard gate valves, quick-opening valves, brass gate valves, American gate valves, Eddy fire hydrants, American fire hydrants, valve boxes, service boxes for gas and water, Hersey meters, Jewell filters, cotton and rubber hose, lead pipe, packing, the Clow patent lead-pipe connection, corporation stops, service stops, diaphragm trench pumps, Clow patent water connection, derricks, water and gas tapping machines, melting furnaces, tampers, chisels, wedges, barrows, shovels, lanterns, &c. The catalogue will be seen from this brief *resume* of its contents to cover everything needed for the installation of water supply, except the men to do the work.

Mayor Bishop of Buffalo, N. Y., has appointed Samuel H. Wright as a member of the Supervising and Examining Board of Plumbers, to succeed Thomas J. Mc Quade, resigned. Mr. Wright has long been one of the head men for Irlbacker & Davis, the plumbing firm, and was recommended for the office by the Journeymen Plumbers' Union.

Alterations and improvements to the extent of $5000 are being made to the salesroom of the J. L. Mott Iron Works, 311-313 Wabash avenue, Chicago. A new iron and plate glass front is being put in, and will occupy a position 2 feet nearer the street than the old one. A new tile platform has been constructed, on which will be placed samples of onyx and imported marble lavatories. The salesroom has been extended 25 feet to the rear, thus giving much more room for the display of samples. The ceiling is to be decorated and electric lights used.

O. D. Peck of Peck Bros. & Co., manufacturers and dealers in plumbers' supplies, 259 Wabash avenue, Chicago, has just returned from a business trip through Canada and Michigan.

W. H. Reeves, one of the prominent architects of Peoria, Ill., has been in Chicago looking through the hotels with a view of securing some good points regarding plumbing for the new hotel being built in Peoria.

The Rome, N. Y., Board of Plumbers have organized by electing Charles H. Jackson president and Lowell Williams clerk. The other members of the board are William E. Donohue, James Cook, Dr. T. M. Flandrau and A. J. Broughton.

Charles H. Muskenhirn of Detroit, Mich., has been granted a patent for an improvement in water closets, the object of which is to provide means for removing the foul air between the traps in a double-trap closet.

An improved form of sewer trap has been invented by Robert Newton, Providence, R. I., the object being to construct a trap in which the syphon will be broken as soon after the first inrush of water to the trap as air may enter the trap, the object being to secure at all times a sufficient quantity of water to make an efficient seal. A feature of the construction is a frame removably secured below the outlets and a horizontal partition having a depending lip secured to the frame.

A ridiculous bill is before the New York Legislature to regulate the price of coal and excites much comment in Pennsylvania. The *Philadelphia Ledger* says that if the companies could make money at the prices fixed they would sell coal at those prices, with or without the law, and if they could not make money they would not sell, and that would settle the law in short order. Another paper in Philadelphia denounces a "commercial war" waged against that State.

British shipowners and the London Board of Trade concur in asking that the Government shall arrange with the United States for the suppression of "crimping" seamen at San Francisco. The seamen on arriving are practically kidnaped and held until the ship is ready to sail, when they are sold at an exorbitant charge.

Manufactures of silk in the United States have more than doubled in value during the last decade, but it does not yet appear that silk fiber from the cocoon can be profitably grown in this country. California did well, but the results were not a commercial success.

Steam and Hot-Water Circulation

The Heating and Ventilating of Large Buildings.*

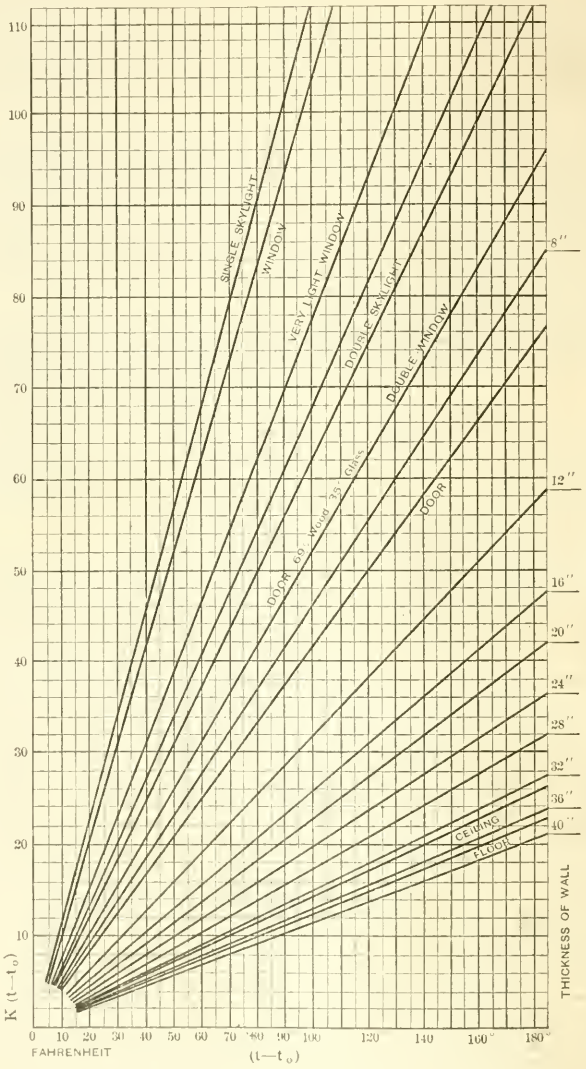
BY ALFRED R. WOLFF, M.E.

The large building of the present day, at least in America, must meet the needs and comforts of an intense, concentrated, nervous and busy "indoor" community, the product of our "rush" civilization. The very fact that both business and pleasures are indulged in on a large scale, in ceaseless haste and at high pitch, renders the community participating in them all the more sensitive to external discomforts, and unwilling to put up with any not of their own individual creation. The very "crowding" and the physical strain and nervous excitement incident thereto renders it important in the battle of existence, called "life," that the best conditions of health be artificially secured, so as to counteract if possible the individual natural neglect. But aside from this, and from a loftier point of view, the modern tendency is to demand the best attainable in every department of work. Whatever the reasons, the demand exists that the best conditions of health and comfort be secured in the large buildings, the meeting places of the multitude. Thus there must be equable temperature, pure air, excellent light and fine sanitation, obtained artificially, almost irrespective of the control, crowding, physical and nervous state of the inmates of the building, and irrespective of climatic and other conditions external to the building.

It is the solution of this problem which converts no small portion of the large modern building into a great factory for the generation and distribution of light, heat, cold and currents of air and water. It is no longer unusual for our large hotels, office buildings and auditoriums to contain a boiler plant of 1000 horse power, with a corresponding electric lighting, heating, cooling and refrigerating system, nor for the equipment of these plants to require an outlay of hundreds of thousands of dollars. And with these large machinery interests at stake it becomes important that the skill of the trained engineer be called into play to insure, in co operation with the architect, the desirable and best attainable results with a judicious expenditure of money.

During the past few years it has been my good fortune to have acted as consulting engineer in the design and erection of the engineering equipment of a number of large buildings, and more particularly of the heating and ventilating plants. On this account, doubtless, your otherwise astute committee has been deluded into the belief that a few words from me in relation to some of the principles and problems entering this specialty might be of passing interest; and if you thus become the innocent sufferers I, at least, am the gainer by having the pleasure of meeting you here this evening.

A systematic account of the various methods of heating in vogue, and their comparative merits, would, on account of the time-limits of our talk, necessarily savor too much of the elementary text book, and would also in all probability convey but few facts not already known to you, or readily secured by perusing any standard work on the subject of heating and ventilation. So I have concluded to be real unsystematic, to make no attempt to be exhaustive, and only to relate at random a few points in connection with heating and ventilating large buildings which have appeared of interest to me in my own practice.



Heat Transmitted, in British Thermal Units, per Square Foot of Surface, per Hour.

DIAGRAM OF HEAT TRANSMISSION.

I present herewith a diagram, showing, for different classes of surfaces composing buildings, co-efficients (K) of transmission

* A lecture delivered before the Franklin Institute, February 3, 1893. From advance sheets of the *Journal of the Franklin Institute.*

of heat per hour for each square foot of surface for various Fahrenheit degrees differences between the temperature of the interior of a room and its external surroundings. This diagram is the graphical interpretation, in American units, of the practice and co-efficients prescribed by law by the German Government in the design of the heating plants of its public buildings and generally used in Germany for all buildings. During the past six months I have checked these co efficients by examples of good American practice, and have found so satisfactory an agreement that it has convinced me of the soundness of the German co-efficients and their applicability to American practice; if, indeed, the well-known care and authority of publication of applied science under German Government patronage did not itself bespeak confidence. In the formula for total heat transmission, $Q = S\ K\ (t - t_0)$, K represents, for various materials composing buildings, the loss by transmission in British thermal units per hour, for each degree of difference between the temperatures on the two sides of the material; S is the amount of transmitting surface in square feet; t is the temperature in Fahrenheit degrees at the interior side, and t_0 the temperature in Fahrenheit degrees at the exterior side of the surface. The value of K varies, of course, not only with the class of surface, but also with its thickness. If, by means of the co-efficients given below and summarized in multiples of temperature differences in the diagram, the loss by transmission of heat to the outside is calculated, we obtain the heat to be conveyed to the room in order to make good the loss due to transmission. This does not, of course, cover the additional heat to be conveyed on account of change of air for purposes of ventilation, but merely represents the loss due to heat transmission through walls, ceilings, windows, floors, &c., of buildings of ordinary good construction, with such slight accidental or natural ventilation as results from the porosity of the materials and construction.

CO EFFICIENT PRESCRIBED BY GERMAN GOVERNMENT.

In detail we have the co-efficient of transmission K as above defined, and as prescribed by the German Government (transformed into American Units), for each square foot of brick wall of thickness:

Thickness of brick wall—inches.	K equals.
4	0.68
8	0.46
12	0.32
16	0.26
20	0.23
24	0.20
28	0.174
32	0.15
36	0.129
40	0.115

1 square foot, wooden beam construction, planked over or ceiled	as flooring,	$K = 0.083$
	as ceiling,	$K = 0.104$
1 square foot, fire-proof construction, floored over,	as flooring,	$K = 0.124$
	as ceiling,	$K = 0.145$
1 square foot, single window		$K = 0.776$
1 square foot, single skylight		$K = 1.118$
1 square foot, double window		$K = 0.518$
1 square foot, double skylight		$K = 0.621$
1 square foot, door		$K = 0.414$

These co efficients are to be increased respectively, as follows:

Ten per cent. where the exposure is a northerly one and winds are to be counted on as important factors.

Ten per cent. when the building is heated during the daytime only, and the location of the building is not an exposed one.

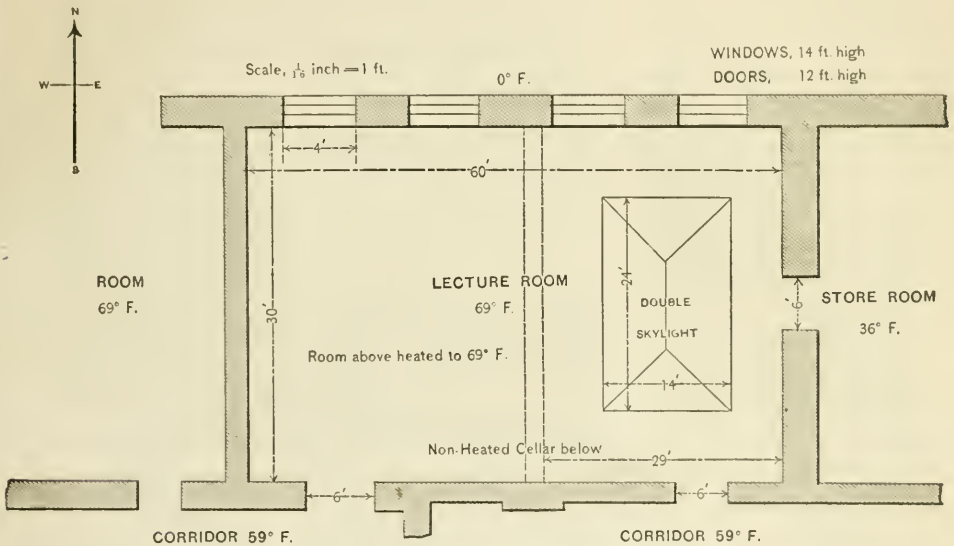
Thirty per cent. when the building is heated during the daytime only, and the location of the building is exposed.

Fifty per cent. when the building is heated during the winter months intermittently, with long intervals (say days or weeks) of non heating.

The philosophy of these increases is, of course, apparent; for the co-efficients, as given, are for heat transmission alone, in usual every-day practice, where the temperature differences in the transmitting portions have assumed a fixed relation, with a corresponding fixed rate of flow of heat. But if the building gets chilled or entirely cold, through days or nights of disuse of heating system, the exposed heat-transmitting portions must be first warmed to the staple degree referred to, which demands, for the time being, additional heat beyond the ordinary rate of supply if the period of warming up shall not be excessive. So, too, special cold winds beating on the exposed surfaces form additional heat abstracting media, besides increasing the amount of cold air entering the building through the pores of the materials and through the ordinary cracks and crevices of well-constructed buildings.

In connection with calculations for heat transmission by means of the co efficients here presented, the German Government prescribes that computations be made on the basis of the following assumed lowest temperatures:

External temperature	4° F.
Assumed lowest temperature of non-heated cellar and other portions of building permanently non-heated	32° F.
Vestibules, corridors &c., non-heated, and at frequent intervals in direct contact with external air	23° F.
Air spaces between roof and ceiling of rooms: Metal and slate roofs	14° F
Air spaces between roof and ceiling of rooms: Denser methods of roofing, such as brick, concrete, &c.,	23° F.



Plan of Room to be Heated.

As the temperature to be attained in rooms of various kinds the German Government prescribes for:

Stores and dwellings	68° F.
Halls, auditoriums, &c.,	64° F.
Corridors, staircase halls, &c.,	54° F.
Prisons, occupied day and night	64° F.

It will be noted that these temperature stipulations vary from American practice in the following particulars:

1. Our calculations, in this vicinity, are based, in general, on an external temperature of 0° F.

2. We figure on heating our corridors, staircase-halls, &c., to from 65° to 68° F.

3. 70° F. is the desired temperature in stores and dwellings, though 68° F. appears to many of us pleasanter.

As a rule, Germans are disagreeably struck on their visits to this country with the higher temperatures of our homes and offices.

Presently, a practical illustration of the method of using the co-efficients and diagram of heat transmission will be given; but inasmuch as the same example can also serve the purposes of showing the method of determining the amount of air required for ventilation, and the amount of heat and of radiating surface to be pro-

vided to meet all conditions, it will be well to first call your attention to a few other facts in relation to heating and ventilation, which enter the problem.

FACTS TO FIGURE FROM.

The external air contains 4 parts of carbonic acid in 10,000, and a room is considered properly ventilated when the proportion of carbonic acid present does not rise to above 6, possibly 8, parts in 10,000. It can readily be shown that to secure the standard of 6 parts in 10,000 means the addition of 3000 cubic feet of fresh air per hour for each person in the room; to attain 7 parts the addition of 2000 cubic feet; 8 parts, the addition of 1500 cubic feet. This air may have to be heated, in the winter months, from 0° F. to, say, 68° F., and at times higher, if it is to be the means of taking care, in addition, of the heat transmission from the room.

Furthermore, it may be well to point out that the value of radiating surfaces is about as follows:

Ordinary bronzed cast-iron radiating surfaces, in American radiators (of Bundy or similar type), located in rooms, give out about 250 heat units per hour for each square foot of surface with ordinary steam pressure, say 3 to 5 pounds per square inch; and about 0.6 this amount with ordinary hot-water heating.

Non-painted radiating surfaces of the ordinary "indirect" type (Climax or pin surfaces) give out about 400 heat units per hour for each square foot of heating surface with ordinary steam pressure, say 3 to 5 pounds per square inch, and about 0.6 this amount with ordinary hot-water heating.

A person gives out about 400 heat units per hour; an ordinary gas burner about 4800 heat units per hour; an incandescent electric (16 candle-power) light about 1600 heat units per hour.

A PRACTICAL ILLUSTRATION.

Now, for the practical illustration: Let us consider, as per accompanying sketch, a large room used, say, as a lecture room, 40 feet by 60 feet and 20 feet high, situated as shown, and with exposures noted. Referring to our diagram, and to coefficients of heat transmission, and to data named above, we obtain the following:

If we assume that the lecture room must be heated to 69° F. in the daytime, when unoccupied, so as to be at this temperature when first persons arrive, there will be required, ventilation not being considered, and bronzed direct low-pressure steam radiators in room being the heating media, about $\frac{113,550}{250}$ = about 455 square feet of radiating surface. (This gives a ratio of about 105 cubic feet of contents of room for each square foot of heating surface).

If we assume that there are 160 persons in the lecture room, and we provide 2500 cubic feet of fresh air per person per hour, we will supply $160 \times 2500 = 400,000$ cubic feet of air per hour—*i. e.*, $\frac{400,000}{48,000} =$ over eight changes of contents of room per hour.

To heat this air from 0° F. to 69° F. will require $400,000 \times 0.0189 \times 69 = 521,640$ thermal units per hour (0.0189 being the product of the weight of a cubic foot by the specific heat of air). Accordingly, there must be provided $\frac{521,640}{400} = 1304$ square feet of indirect surface, to heat the air required for ventilation, in zero weather. If the room were to be warmed entirely indirectly—that is, by the air supplied to room (including the heat to be conveyed to cover loss by transmission through walls, &c.)—there would have to be conveyed to the fresh-air supply $521,640 + 113,550 = 635,190$ heat units. This would imply the provision of an amount of indirect heating surface of the Climax type of $\frac{635,190}{400} = 1589$ square feet, and the fresh air entering the room would have to be at a temperature of about 84° F., viz., $69° + \frac{113,550}{400,000 \times 0.0189}$ or $69 + 15 = 84°$ F.

Table Showing Heat Units Transmitted from (and to be Conveyed to) Room on Account of Heat Transmission Through Walls, Ceiling, Floor, Windows, &c.

Number.	Room.	Cubic contents (in cubic feet).	t (Fahrenheit degrees).	$t - t_0$ (Fahrenheit degrees).	Kind of transmitting surface.	Thickness of wall (in inches).	Calculation of area of transmitting surface.	Square feet of surface.	K, $(t - t_0)$.	Thermal units.	Supplementary allowances.
	Lecture room.	48,000	69	69	Outside wall.	36	$63 \times 22 - 448$	938	9	8,442	10 per cent.
				69	Four windows (single).		$4 \times 8 \times 14$	448	72	32,256	10 per cent.
				33	Inside wall (storeroom).	36	$42 \times 22 - 72$	852	4	3,408	
				33	Door.		6×12	72	19	1,368	
				10	Inside wall (corridor).	24	$45 \times 22 - 72$	918	2	1,836	
				10	Door.		6×12	72	5	360	
				10	Inside wall (corridor).	36	$17 \times 24 - 72$	302	1	302	
				10	Door.		6×12	72	5	360	
				69	Roof.		$32 \times 42 - 336$	1,008	10	10,080	
				69	Double skylight.		14×24	336	43	14,448	
				33	Floor.		62×42	2,604	4	10,416	
										83,276	
							North outside wall, 10 per cent.			844	
							North outside windows, 10 per cent.			3,226	
										87,346	
							Exposed location and intermittent day or night use, 30 per cent.			26,204	
							Total			113,550	

OTHER SOURCES OF HEAT.

The above calculations do not, however, take into account that 160 persons in the lecture hall give out $160 \times 400 = 64,000$ thermal units per hour; and that, say, 50 electric lights give out $50 \times 1600 = 80,000$ thermal units per hour, or, say, 50 gas lights, $50 \times 4800 = 240,000$ thermal units per hour. The presence of 160 people and the gas lighting would diminish considerably the amount of heat required. Practically, it appears that the heat generated by the presence of 160 people, 64,000 heat units, and by 50 electric lights, 80,000 heat units, a total of 144,000 heat units, more than covers the amount of heat transmitted through walls, &c. Moreover, that if the 50 gas lights give out 240,000 thermal units per hour, the air supplied for ventilation must enter considerably below 69° F., or the room will be heated to an unbearably high temperature. If 400,000 cubic feet of fresh air per hour are supplied, and 240,000 thermal units per hour generated by the gas must be abstracted, it means that the air must under these conditions, enter $\frac{240,000}{400,000 \times 0.0189} =$ about 32° less that 84°, or at about 52° F. Furthermore, the additional vitiation due to gas lighting would necessitate a much larger supply of fresh air than when the vitiation of the atmosphere by the people alone is considered, one gas light vitiating the air as much as five men. However, we need not consider these computations more in detail, our object being mainly to point out and illustrate the methods of analysis and calculation in such a case, and to show how readily the problems can be solved by the data herein given.

SOME PRACTICAL CONCLUSIONS.

A few practical conclusions are at once apparent: That the amount of air required and the temperature of the entering air, as well as the amount of heating surface to be called into play, will vary very greatly in the same room, not only with variations in external temperature, but with any given external temperature, according to the use, occupation, method of lightning, &c., of the room. Also that the variations will often be so quick during a short period of use of room, especially in auditoriums, theaters, ballrooms public dining halls, &c., that it is important either to have automatic heat regulation or a competent engineer, who constantly and closely watches the changes in temperature and modifies the operation of apparatus accordingly. Of course, a stable condition of audience, lighting, &c., once secured the regulation is a comparatively simple matter (a fixed right condition of operation of apparatus then usually filling the need); but from the time of opening the hall until this stable condition is reached conditions will vary so much that failure is sure to result with the otherwise best apparatus, unless it be designed to regulate its heat radiation, &c., automatically, to suit these varying conditions, or a most competent engineer, of good judgment, regulate the apparatus, according to frequent thermometer readings or reports

RESULTS OF ELECTRIC LIGHTING.

From the considerations already set forth, and others to be presented, it will readily be inferred that the almost general introduction of electric lighting with isolated generating plants in large buildings has had a sensible effect on the solution of the heating and ventilating problem. On account of the economy secured it has practically conditioned the use of exhaust steam for heating. It is an interesting fact that the quantity of steam required for heating and ventilating large buildings, notably club houses, colleges, theaters, halls, &c., equals closely the amount used independently for their electric lighting. Since electric light engines convert only about 10 to 15 per cent. of the heat of the steam with which they are supplied into mechanical energy, 85 to 90 per cent. of the heat is retained in the exhaust steam, available and just sufficient, as a rule, to meet the heating and ventilating needs of the building. This means, practically, that a boiler capacity ample for the heating and ventilating will take care, in addition, of the electric lighting of a large building, or *vice versa*; and that in the winter months the electric lighting is secured at only a slightly increased fuel expense. It is this fact which makes it difficult for either city or district heating, or electric lighting companies, to supply steam or electricity, respectively, to large buildings. They cannot compete with the cheapness of generation of the composite

system of electric lighting and exhaust steam heating of the isolated plant within the building. Of course this composite system implies generally the additional wages of an extra fireman or engineer, but it can easily bear this additional expense, and still be decidedly on the winning side in competition with outside district companies. It is of importance to have the cylinder proportions of the electric light engines such that the desired power is developed with a back pressure as high as 5 pounds to the square inch; for in American practice such pressure may be required for heating in the coldest weather. This back pressure, if originally figured on, is neither detrimental nor uneconomical, and I have not been able to recognize any advantages in the vacuum systems, except where the engines or the piping were proportioned incorrectly at the outset, or where the installation of the electric lighting plant and the use of exhaust steam for heating were afterthoughts. In those cases the vacuum systems frequently perform a useful service.

Another way in which the introduction of electric lighting has affected the heating and ventilating problem is, as above already referred to, that the electric lights give out less heat and vitiate the atmosphere less than gas. Besides, there are no volatile products of combustion—representing vitiation and heat—to be taken off as far as practicable at the points of generation; nor must flicker of light, on account of air currents, be guarded against. The fact that a single gas light vitiates the air as much as do five persons, and that the electric light causes no vitiation whatever, materially affects the quantity of fresh air to be supplied to keep the atmosphere within a room at a proper standard of purity. Again, the fact that besides not dealing with obnoxious gases, no flicker of flames must be considered in electric lighting, renders it possible, when so desired, to bring in the fresh-air supply at the top of a room (either by wall registers or through perforated suspended ceilings) and to exhaust at the bottom, a reversal of the ordinary process, and one impracticable when gas lighting is resorted to.

CEILING AIR SUPPLY.

While, in my judgment, the main problem in the proper ventilation of large buildings is to secure an adequate supply to, and removal of air from, the separate rooms, I would like to call your attention to a distinct and important advantage obtained by having the air enter through perforated ceilings at the top of the rooms and exhausting at the bottom. At night, in a crowded assembly, when the electric lights aglow are giving out some heat, even though it be considerably less than gas lights would evolve, it is frequently found in practice, as the calculations of our example have already indicated should be the case, that, even in very cold weather, to keep the air within the room at a temperature of 68° F., the entering fresh air must be at a temperature considerably lower than 68 degrees. At the recent opening of the new concert hall of the Mendelssohn Glee Club Building—a room with scarcely any outside exposure, and practically dependent on an artificial air supply by means of a blower—it was found necessary, even while supplying over 3000 cubic feet of fresh air per hour for each of the 1000 persons in the audience, and with an external temperature of 40° F., to have as low a temperature as 52° F. for the entering air, to keep the hall at 68° F. Nor is this an unusual experience.

If the entire air supply enters by means of registers, or openings in or near the floor, it is very difficult, however large the openings, to obtain such a distribution and low velocity as will prevent the sensation of a cold draft when air is entering in large volume at a low temperature. It is a possibility, but usually it is impracticable structurally to secure the required low velocity and uniform distribution. But if the air enters at the top, not only can a low velocity and uniform distribution be secured by means of large perforations in decorative designs of suspended ceilings, but a low velocity is of less importance, for the cooler air is heated in transit, and by the time it has reached the audience it has attained a temperature in the neighborhood of 68° F., and is no longer cooler than the air at exhaust where the people are congregated. If the hall is very high it requires quite a powerful exhaust to insure the air reaching the floor at such times as the entering air must be heated; but this is a detail readily solved in practice. In the main auditorium of the Carnegie Music Hall, with its seating capacity of over 3000, the fresh, cooled or warmed air enters through perforations in the suspended ceiling, and travels with slow velocity a hight of about 80 feet to exhaust openings in the floor risers and an equable temperature is maintained under any external atmospheric conditions. In such a system it is specially important that the volume of air exhausted be less than the volume of fresh (warmed) air forced into the hall, so that the air within the room be under pressure; otherwise, external cold air will be drawn into the building through doors and windows and may create objectionable drafts. But the desired conditions here briefly presented are readily attainable; and, especially in case of an inclosed room, the system of supply at ceiling and exhaust at floor level is the ideal one, when the room is lighted electrically, to secure pure air and moderate temperatures, in crowded assemblies, during the winter months. In the summer time many persons like to feel a decided current of cooled or cooler air; and thus it is often considered preferable to have the air enter at bottom and to exhaust at top of room. A reversible system may then be adopted to meet the conditions of comfort all year round.

In my own practice, when air enters and is exhausted through ducts in the walls, I have found it advantageous to have both top and bottom registers for each fresh air flue and top and bottom registers for each vent flue. In this way the fresh air, when warmed, can enter at one and the same time through bottom and top register, with a corresponding desirable reduction in velocity, each flue having two outlets. When the air in the winter months, on account of crowded assembly, must enter at a low temperature, the bottom register can be closed, and in the summer time, if a current of cold air is to be strongly perceptible, the top register can be closed. In general, when air enters through top registers, the exhaust should also be by means of the bottom registers of the vent ducts, and *vice versa*, and when air enters through both top and bottom registers, the exhaust should also be through top and bottom registers.

The selection of the special system of heating and ventilating to adopt in a particular building depends, of course, in addition to the considerations already set forth, and to similar ones of a physical and engineering nature, greatly on the structural possibilities; for, important as are the heating and ventilation, owners and architects are not as yet quite ready to sacrifice other useful and artistic features to the one which has been the topic of this lecture. The engineer, therefore, if he would not have the heating and ventilating needs neglected, should be quick to recognize the system to adopt which will insure success and will, at the same time, not prove a nuisance to the specific architectural and artistic interests of the building. Frequently, such decision must be cast at a first inspection of the plans. Of course, there should be "give and take" in this matter on both sides, and the purely decorative and structural interests should occasionally yield a point too.

It is evident that the best result is achieved if the engineer who is to design the engineering equipment be consulted when the original architectural plans are drawn and before these plans have crystallized into definite and unalterable shape. For thus, in harmony of co-operation, the best is accomplished by both the architect and the engineer, and the engineering equipment, including the heating and ventilation, proves satisfactory, without encroaching on the highest architectural, structural and artistic possibilities and success. In closing, it is a pleasure to record that at the present time some of the leading architects recognize the advantages of an early co-operation in these respects with the engineer.

English Practice in Hot-Water Heating—XX.*

BRICK SET BOILERS (CONTINUED).

The description (and fixing) of the plain saddle boiler was completed in the last paper, and the next and nearest design is as Fig. 80. This is practically a saddle boiler with flue way carried through the top of it from front to back, as shown. The particular advantage of this top flue is that the flame and heat are thus brought beneath a heating surface—a horizontal surface that comes over the source of heat being of so much greater value than one that bounds it on the side, or one that comes beneath. To illustrate the method of fixing this boiler, some makers' lists show it in section, with the flame first passing through this flue from back to front and then passing over the top of the boiler to the chimney. So far as conducting the flames into this top flue at the back immediately they leave the fire, no objection can be raised, it being the best plan; but when the flame issues from this flue in front, it would be much better to carry it down and along each side, so as to benefit by the vertical surfaces. Some of the more powerful boilers have iron feathers provided expressly to do this, and it is undoubtedly the best way. In any case, the flame should go through the top flue first. This style of boiler is made with two top flues through it, one above the other, but it is not, to the best of the writer's belief, in great demand.

It should be explained that the few representative boilers now being referred to are not the only patterns worth recommending by any means. They are merely a representative few that have seen good service, and, therefore, can be safely referred to.

The next and nearest approach to the last boiler is Fig. 81, a very powerful and efficient boiler. It is practically a saddle, with waterway ends front and rear, and a flueway through the top. In fixing this it is arranged for the flame to first enter the top flue at the back, and as it leaves the front to be conducted down and along the sides under the mid-feathers provided, and as the arrows indicate. This, as already explained, has to have a top feeder, as the waterway front does not admit of feeding from this point. A boiler of this shape will, in the larger sizes, heat up to 4000 feet of 4-inch pipe, and it can be well adapted for shallow drainage (*i.e.*, when the boiler pit cannot well be made deep owing to water being found in the earth too near the surface). The top surface of this boiler is not usually made use of; the brick work rests upon it above and the feeder nozzle projects through above. A soot door would have to be provided op-

* Reprinted from the *London Builder*.

posite the top flue, for the easy removal of the dust or soot which will readily accumulate in it.

A good boiler, somewhat like the last in general character, is as Fig. 82. This, like the last, is not confined to one maker. It is to all intents a saddle boiler with waterway ends, but the flue way through the top is made in two distinct passages, as will be seen at Fig 83, which is the elevation, in section, just through the feeding nozzle. It will be noticed in this boiler that the top flues do not extend quite to the front, but have their sides cut away back some inches. This permits of the boiler front being butted tight up against the front brick work, and no intervening brick work to give direction to the flame is needed. In this boiler, as shallow drainage, but having a high power, if the chimney is suited. This must end our list of horizontal boilers, although there are very many more almost, if not quite, equally deserving of mention. It is strange how certain pattern boilers will be in favor in certain districts, but not elsewhere, and again a certain pattern may have a great demand for a certain period, then cease almost entirely. It may revive again, or it may not. Every boilermaker can give peculiar experiences in this way.

The next form of boiler to be noticed is of an upright character, quite different to those already mentioned, as Fig. 85. This is a very efficient form of boiler, and is particularly well adapted for those building works that extend up several floors, and which have an enormous press- propped up on fire bricks and a stoking aperture thus provided for. Sometimes the feeding door, which is shown on top, projects from the top edge toward the front. This latter arrangement is for such times when the fuel cannot be shoveled in at the top. This boiler is practically fixed in a circular brick-work chamber, of such a width that the feathers reach each side tightly. Waterway mid-feathers can be had if desired. They add considerably to results.

Wagstaff's segmental boiler is well worthy of notice. This is made in two shapes, the shape most known being of the ordinary saddle outline, as Fig. 86. It is a cast boiler and the sections are bolted together as shown. The form of the sections makes the interior deeply con-

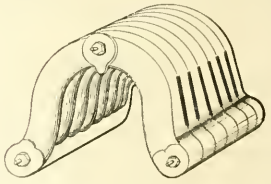

Fig. 86.—One Form of a Segmental Boiler.

ENGLISH PRACTICE IN HOT-WATER HEATING.

with the last, the flame, as it leaves the top flues in front, is taken down beneath the mid-feathers shown, so that it may operate on the vertical sides. The top is not used except to support brick work, this being all that it is good for, as before mentioned. Two top soot doors would be needed (in front) in this case

Fig. 84 represents a still more powerful boiler, owing to its having an additional pair of flues through it, but this, let it be noted, necessitates a tolerably efficient chimney, which can only be gained by having it a sufficient hight. (Chimneys will be treated separately.) With this boiler the flames, as they leave the boiler, enter the two lower side flues by an entrance provided in the fire box. From these, as they make their exit in front, they are conducted into the top flues. After passing along these and out at the back, they are brought along and beneath the feathers, and pass from there to the chimney. It is a shallow boiler suited for ure exerted in the boiler—that is, of course, at the lowest point. A cylindrical shape is best adapted to withstand a pressure. This pattern well fulfills what is so desirable in a boiler, viz.: a shape that will envelop the fire; and it nearly approaches the inverted basin shape that Hood spoke so highly of years ago. This has a top feeder, and is adapted for taking a charge of fuel. The hole shown in the front of the drawing is the flue way from the interior of the boiler, and the brick work is arranged so that the flame is caused to take the direction indicated by the arrows. The grating over the hole is merely to keep the fuel from falling through into the flues.

The lower front edge may be level with the rest of the boiler bottom, or it may have a little arched opening at Fig. 85; this arched aperture being just behind the stoking door and for the passage of the stoking tools into the fire box. If this arched way is not provided the boiler is voluted, which adds materially to the heating surface. Between each section will be noticed a vertical slot like opening, the object of this is as follows: The boiler is not intended for flues in the ordinary way, but is placed on the customary level base with fire bars suitably provided; the brick work is then carried over it corresponding to the shape of the boiler, but leaving from 3 to 4 inches between. The front and back ends come tight against the brick work.

When this boiler is in use the heated products escape through the slots or fissures at the sides between the sections, and then, in their passage to the chimney, envelop or embrace the outer surface.

HEATING NOTES.

The Capitol Heater Company, Detroit, Mich., issue a notice under date of February 6 to the effect that they have bought out the business of the Detroit

Heating & Lighting Company, so far as relates to the sale of the Bolton hot-water heaters. The managers of the Capitol Heater Company were connected with the Detroit Heating & Lighting Company from the time when they began to push the Bolton until a year ago, and are therefore thoroughly familiar with all the points of the apparatus. They mention in the notice that an important consequence of this arrangement is the abandonment of contract work, and they say that it is and will be the policy of the Capitol Heater Company to take no contracts under any circumstances and to turn over everything to the local trade, whom they will assist in every way in working up a profitable business.

The Holland Radiator & Mfg. Company, 89 Lake street, Chicago, state that they have established plants for the manufacture of their steam and hot-water radiators at Jenison, Mich., Elwood and Bremen, Ind., and Springfield, Ohio. Operations are conducted at each of these four places by a local company, in which the parent company has an interest. The latest of these projects to be established is at Elwood, Ind., where the Elwood Iron Company will conduct the business of manufacturing Holland radiators. From a local paper we learn that the DeHority Land Company at Elwood donated four acres of land to the factory for buildings and a number of lots adjacent. The buildings are to be all of brick. Four main buildings are each to be 50 x 160, while four smaller buildings are each to be 40 x 80. The foundry is expected to be in operation early in the spring. The total annual capacity of the four plants of the Holland Radiator and Mfg. Company is estimated by them at about 2,500,000 feet. T. Holland is president of the company, J. E. Holland is secretary and A. H. Fitz treasurer.

Among the orders recently taken by E. C. Merrill, 168 Second avenue, Pittsburgh, Pa., for his gas burners, was the equipment of two steam-boiler furnaces, the boilers being of 50 horse-power each, used for generating electrical currents. Other orders were for three batteries of burners for heating a hot-water boiler at residence at North Highland avenue, hot-air furnace on Irwin avenue, burners for steam-heating boiler at Edgewood and two laundry water-heating systems.

The Mason Regulator Company, Boston, Mass., manufacturers of steam-regulating devices, send out a circular to the trade in the shape of a United States mail pouch. On unbuckling the imitation the inside reveals an announcement of the Mason Regulator Company.

Clarence C. Mulford of Galva, Ill., has assigned to Wallace H. Ryon, Sycamore, Ill., a patent on a radiator. The patent covers a sectional radiator having its meeting surface at the base of the sections provided with interlocking sections with recess to prevent lateral rocking of the sections independently of each other.

The Farquhar Heating Company, 58 Dearborn street, Chicago, manufacturers of the Farquhar seamless air warmers, combination and hot water heaters, report a very successful season. Among the buildings in Chicago and vicinity in which these heaters have been placed can be mentioned: Roseland Club House, hot-water heater; residence of Geo. A. Watson, Wilmette, warm air heater; Rev. R. W. Bland, Rogers Park, hot-water heater; A. N. Townsend, Blue Island, warm air heater; Geo. Hinman, Blue Island, hot-water heater; J. J. Danforth, Hinsdale, combination heater; Benezette Williams, Western Springs, Ill., hot-water heater.

The American Radiator Company, 111-113 Lake street, Chicago, have arranged for the erection of a large warehouse in Boston, which will be especially adapted for handling and carrying a large stock of "American" radiators. The building will be completed and stocked in time for the coming season's business, and will place the company in a still better position than ever to supply immediately the wants of their New England customers. The New York branch of the same company have also secured a new warehouse, which they state is much larger and finer than any they have previously had, and which is especially adapted to their business, in which they will carry a much larger stock than ever before from which to supply their patrons in that section.

A Disastrous Explosion.

The note of warning sounded in the editorial columns of this paper in our issue of January 7, under the heading "Explosions of Gaseous Mixtures," was fearfully emphasized on the afternoon of the 6th inst., at 422 West Fortieth street, New York City. An employee of one of the gas companies visited the premises to repair a gas meter, it is said, and went into the cellar for that purpose. Exactly what occurred in the cellar previous to the tremendous explosion that shortly followed will never be known. The workman may have had a fit or have met with some accident. All that is known is that the sound of his tools suddenly ceased and that shortly after that a smell of gas began to pervade the premises. A proprietor of a saloon on the first floor of the building became alarmed and went to the door of the cellar, where his fear that something had happened to the gasfitter was at once strengthened by the strong odor of the escaping gas. Summoning help, he entered the cellar with three others, intending to rescue the fitter from his perilous position. A number of others followed the rescuing party, and it is said that some one of these idlers struck a light. A terrific explosion followed, the result of which was the killing of the gasfitter (assuming that he was not already dead) and more or less seriously injuring some 20 other persons in and around the building. Those in the cellar were badly bruised and burned. The premises took fire and the building was shortly a complete wreck in spite of all efforts of the firemen to save it. The injuries in most cases consisted of wounds from shattered and flying glass and from burning. Fortunately the explosion was not violent enough to wreck the building at once, or the death roll would have been large, as the building was a six story double tenement house swarming with people of the poor class. So far as now known no life was lost except that of the unfortunate gasfitter, and it is quite possible that his life might have been saved had the efforts made for that purpose been more intelligently directed.

James L. Chambers died at his home in Troy, N. Y., January 30. He was born in that city 70 years ago. He was a gasfitter by trade. About two months ago he suffered a stroke of paralysis and was confined up to the time of his death. He was highly respected and is survived by his widow and three sons.

A patent has been granted to Charles A. Williams and Arthur W. McAllister, Chicago, Ill., administrators for Levi K. Williams, for a pattern table for sheet metal shearing machines.

A report from Ottawa says that the French Government propose to buy the Sudbury nickel mines in Ontario, the object being to manufacture nickel steel armor plates for the navy.

House Warming.—III.

LIGNITES.

Lignites, usually known as brown coals, are the common fuel in many locations in all of the coal-producing States in this country. Their composition varies considerably, and we will, therefore, consider an average sample only. The analysis, by Professor Cox, of a sample from Bellingham Bay, Washington, gave the following results:

	Per cent.
Carbon	67.090
Hydrogen	4.555
Sulphur	1.000
Water	7.000
Ash	5.100
Oxygen, &c.	17.355

The percentage of oxygen not being given, it is impossible to give exact value of the hydrogen; but we may assume it to be, say, 3 per cent., which gives:

	Calorific value. Heat units.
Carbon 67.09 × 14,544 =	9,757.57
Hydrogen 3.00 × 62,032 =	1,860.96
Total per pound lignites	11,618 53

BITUMINOUS COAL.

Bituminous coals, such as are used for domestic purposes, vary considerably according to locality, and we can, therefore, consider only an average or approximate composition, as given by Mr. Barr, taking for our purpose, the mean of the range of percentages specified:

	Per cent.	Mean. Per cent.
Carbon	75 to 80	77.5
Hydrogen	5 to 6	5.5
Nitrogen	1 to 2	1.5
Oxygen	4 to 10	7.0
Sulphur	0.4 to 3	1.7
Ash	3 to 10	6.5
Available hydrogen = 5.5 − ⅛ =		4.625

The value, therefore, is:

	Heat units.
Carbon 77.5 × 14,544 =	10,831.6
Hydrogen 4.625 × 62,032 =	2,869.0
Total per pound coal	13,690.6

SEMI ANTHRACITE COAL.

The semi anthracite coals, though similar to the hard varieties, contain less fixed carbon and a correspondingly larger percentage of volatile matter. From the Pennsylvania Geological Survey we quote an analysis of sample from Wilkesbarre, together with the calorific values, as the quantities are not given in sufficient detail for calculation:

	Per cent.
Fixed carbon	88.90
Volatile matter	7.68
Earthy matter	3.42
	Heat units.
Carbon 0.8890 × 14,544 =	12,930
Volatile matter 0.0768 × 16,515 =	1,269
Total per pound of coal	14,199

COKE.

Oven coke, of late years, has come to be largely used for the purpose we are considering. Its composition, as shown by the following analysis, is almost pure carbon, and its calorific value is therefore high:

Carbon 96.16 % × 14,544 =	13,985.5 heat units per pound coke
Ash 3.84	
Total 100.00	

WOOD.

Wood of many varieties, both hard and soft, is almost exclusively used, in many localities where, on account of its abundance, as compared with other kinds of fuel, it is much cheaper than the latter, even though it is used in an unnecessarily

wasteful manner. It has some advantages, though, of course, on the basis of equal cost for a given unit of result, coal may be considered preferable. Rumford has demonstrated by numerous experiments that all woods have substantially the same heating power, and that the only difference in results obtained is due to the varying percentages of water. That the variation of this quantity is considerable is shown from the following results of experiments by M. Violette, which give the water driven off from the woods named, at a temperature of 437° F., to be: Oak, 44.31 per cent.; ash, 33.38 per cent.; elm, 40.56 per cent.; walnut, 36.56 per cent.

As this wood had been seasoned by two years' exposure to the atmosphere, under cover, it would appear that the normal saturation of the several varieties had been reached, and that consequently, their relative commercial values would be dependent on this factor to a great extent. Of course, where the moisture is dissipated by artificial means the equality of values is established.

The results of Rumford's experiments are very closely confirmed by chemical analysis, as shown by the following table of results obtained from several hard and soft woods by M. Eugene Chevandier:

Chemical Composition, Per Cent.

	Names of woods.	Carbon.	Hydrogen.	Oxygen.	Nitrogen.	Ash.
Hard.	Beech,	49.36	6.01	42.69	0 91	1.00
Hard.	Oak,	49.64	5.92	41.16	1.29	1.97
Hard.	Birch,	50.20	6.20	41 62	1.15	0.81
Soft.	Poplar,	49.37	6.21	41.60	0.96	1.86
Soft.	Willow,	49.96	5.96	39.56	0.96	3.37
	Average...	49.70	6.06	41.30	1.05	1.80

The respective calorific values from these quantities, we find, are as follows:

Woods.	Carbon.	Units.	Hydrogen.	Units.	Total per pound of wood. Units.
Beech.....	$0.4936 \times 14{,}544 =$	7,178.9	$0.0601 - \frac{0.4269}{8} \times 62{,}032 =$	416.6	7,594.5
Oak.....	$0.4964 \times 14{,}544 =$	7,219.6	$0.0592 - \frac{0.4116}{8} \times 62{,}032 =$	483.8	7,703.4
Birch.....	$0.5020 \times 14{,}544 =$	7,301.0	$0.0620 - \frac{0.4162}{8} \times 62{,}032 =$	620.3	7,921.3
Poplar	$0.4937 \times 14{,}544 =$	7,190.4	$0.0621 - \frac{0.4160}{8} \times 62{,}535 =$	626.5	7,816.9
Willow	$0.4996 \times 14{,}544 =$	7,266.2	$0.0596 - \frac{0.3956}{8} \times 63{,}535 =$	633.3	7,899.5
Average.....		7,231.2		555.9	7,787.1

The quantity of heat actually available from fuel containing a large percentage of water is somewhat reduced by the amount of the sensible heat of combustion absorbed by the water in raising its temperature from normal to 212°. Rumford gives the calcrific value of dry wood as 6480 units, which, being derived from actual experiment, is probably a safe standard.

CHARCOAL.

Charcoal, though not extensively used in this country, may still be considered as belonging to the class of domestic fuels. By experiment and analysis Péclet gives its composition as carbon, 93 per cent., and ash, 7 per cent., thus showing it to be practically pure carbon, or, at least, that the latter is the only combustible element present. This, however, is misleading, as it is only charcoal burned at very high tmperatures which give these quantities. The ordinary commercial charcoal is burned at from 500° to 600° F., while that of the composition given by Péclet would be at about 2500°. The physical properties of the two products are quite dissimilar—the former igniting easily and burning freely, while the latter is much more difficult to ignite. The following results of analyses by M. Violette give the respective composition of charcoals from the same wood (black alder) burned or carbonized at 572° and 2732° F.:

Temperature.	Carbon. Per cent.	Hydrogen. Per cent.	Oxygen. Nitrogen. Loss. Per cent.	Ash. Per cent.
572°	73.24	4.25	21.96	0.57
2732°	94.57	0.74	3.84	0.66
Melting point of platinum.	96.52	0.62	0.94	1.95

It will be seen from the above that the carbon increases with the temperature, as also the ash, while the volatile matters comprising the hydrogen, oxygen, nitrogen, &c., decrease in corresponding amount. The percentage of carbon for a given weight of wood also decreases with increase of temperature, being 24.61, 16.36 and 14.47 per cent., respectively, for the temperatures given. The quantities given in the first-named analysis, therefore, will represent the fuel value of the ordinary charcoal. As the percentage of oxygen is not given separately, it will be necessary to assume it, in order to calculate the calorific value. The quantity given for oxygen, nitrogen and loss, being 21.96 per cent., we will be safe in calling the maximum amount of oxygen as one-half, or say 11 per cent. Then, hydrogen $= 4.25 - \frac{11}{8} = 2.875$ per cent. We find the fuel value of 1 pound of charcoal to be:

	Heat units.
Carbon.....$0.7324 \times 14{,}544 =$	10,652.0
Hydrogen.....$0.02875 \times 62{,}032 =$	1,783.4
Total heat units per pound.....	12,435.4

	Per cent.
Carbon....	58.18
Hydrogen....	5.96
Oxygen....	31.21
Nitrogen....	1.23
Ash....	3.43

Reducing these to their calorific values, we have

	Heat units.
Carbon..... $0.5818 \times 14{,}544 =$	8,461 7
Hydrogen.. $0.0596 - \frac{0.3121}{8} \times 62{,}032 =$	2,996.0
Total per pound of peat.....	11,457.7

As the specific gravity (mean) is but 0.528 as compared with 1.25 to 1.35 for bituminous coals, and 1.50 to 1.55 for anthracite, it is, of course, quite bulky in comparison with equal weights of the latter, and, therefore, to burn it advantageously for domestic purposes it would probably be necessary to provide special facilities particularly adapted to its use.

SUMMARY.

In order to apply the data we have obtained from the foregoing calculations it will be necessary to tabulate the summaries of such quantities as may be needed in our subsequent investigations as to the results obtained from the different fuels in their application to domestic purposes.

Fuel.	Per cent.		Heat units.		
Name of material.	Carbon.	Hydrogen.	Carbon.	Hydrogen.	Total.
Pure.....	100.00	100.00	14,544	62,032.00	76,576.00
Anthracite coal	92.07	0.15	13,390.7	93.03	14,221.00
Cannel coal.....	71 10	4.47	10,340 8	2,772 80	13,113.60
Lignites....	67.09	3.00	9,757.6	1,861.00	11,618.50
Bitumin'us (mean)..	77.50	4.625	10,831.6	2,869.00	13,690.60
Semi-anthracite..	88.90	2.04	12,930.0	1,269.00	14,199.00
Woods (mean)...	49.70	0.90	7,231.2	555.90	7,787.10
Charcoal 572° F....	73.24	2.875	10,652.0	1,873.40	12,435 40
Peat, Irish, (mean)...	58.18	5.96	8,461.7	2,996.00	11,457.40

(*To be continued.*)

PEAT.

A fuel material called peat, which is almost entirely unknown as a commercial product in America, is much used in many localities in Europe. This appears somewhat strange, considering the fact that some of the largest deposits in the world are to be found in this country, and that its production in marketable form is easy as compared with coal. It burns freely and possesses a comparatively high fuel value. The following quantities are the averages of results of analyses of seven different samples of Irish peats, and may be considered as fairly representing the value of the fuel. The samples selected were all of different physical structure and density.

A simple stove pipe fastening, by which the longitudinal edges of pipe section or lengths may be united and readily disconnected, forms the basis of a patent recently taken out by Oliver S. Garrettson of Buffalo, N. Y., and Walter S. Shippe of Minerva, Ohio. The construction of the stove pipe is such that a large number of sections may be placed one within the other to facilitate shipment and compact and close storage of them.

The accumulation of "wheat in sight" constantly grows, despite the effort on the part of speculators to suppress the facts. In January, as in December, the stock in Western hands increased, contrary to all precedent. Last week there was an unexpected additional discovery of wheat in store in the Northwest, bringing the grand total of available stocks of wheat to the hitherto unattained total of 107,870,000 bushels, as compared with only 67,183,000 bushels one year ago, after we had harvested the largest wheat crop in the history of the United States.

Under the Reciprocity Treaty with Hawaii sugar grown in those islands was admitted into the United States free of duty, and the planters were making 75 to 100 per cent. on their plantation investments. The subsequent remission of duty on the part of the United States amounted to something like $6,000,000 a year. Now that not more than 10 per cent. can be made on sugar cultivation, the planter sees in annexation the advantage of the 2 cents per pound bonus.

Weekly Prize Competitions.

$25.00.

FOR MORE than six months Weekly Prize Competitions ($10) have been an interesting and useful feature of the *Pharmaceutical Record*, a journal issued from this office and devoted to the interests of the drug trade. These weekly competitions have related to a variety of technical and business questions of interest to druggists, and have brought out a large amount of information of much service to the readers of that enterprising journal. In view of the success of this feature we have decided to announce a similar series of Weekly Prize Competitions on questions of interest to our readers, and invite a general participation on the part of the trade. As the object of these competitions is to obtain information which will be of practical service to our readers, and to discuss questions in which they are interested, we shall esteem it a special favor if any in the trade will suggest subjects for such competitions, which, if deemed suitable, we shall take pleasure in using.

In each competition there will be three prizes—a first prize of $12.50, a second prize of $7.50 and a third prize of $5. The prizes will be awarded for the answers which in the judgment of the committee of award are most suitable for publication and of the most general interest. These competitions are open to every one, and it is hoped that there will be a general response from business men. Those intending to compete are reminded that it will not be necessary to write long essays, but that comparatively brief and business-like answers to the different questions will be favorably regarded as meeting the purpose for which these competitions are announced. We shall have the privilege of publishing any or all of the contributions received.

Weekly Prize Competition No. 5.

SUBJECT:

A Method of Securing a Reliable and Prompt Delivery of Goods.

This competition deals with the delivery of goods by retailers, and touches the following among other points, which will readily occur to our readers:

Marking name and address of purchaser on goods;

Disposition of goods awaiting delivery;

Time and method of delivery;

Form of receipt signed upon delivery of goods;

General suggestions on the subject.

The following prizes will be awarded:

First prize	$12.50
Second prize	7.50
Third prize	5.00

Replies are to be received not later than March 4, 1893. They should be addressed as follows:

DAVID WILLIAMS,
96-102 *Reade street,*
New York.
Weekly Prize Competition No. 5.

The Weekly Prize Competitions noted below are now before our readers and remain open until the dates named:

No. 2. Closing February 11.
How to Keep the Store Neat and Clean.

No. 3. Closing February 18.
Waste in the Store and How to Avoid It.

No. 4. Closing February 25.
Suggestions as to Improvements in Putting up Goods.

No. 5. Closing March 4.
A Method of Securing a Reliable and Prompt Delivery of Goods.

Another subject will be announced in our next issue.

Our readers are also reminded of the following Prize Competitions, announced on another page, in each of which four prizes, of $50, $25, $15 and $10, are awarded:

No. 6. Closing February 18.
How Retailers Can Best Advertise and Extend Their Business.

No. 7. Closing February 18.
Travelers' Yarns.

No. 8. Closing February 18.
How to Treat Clerks.

No. 9. Closing February 18.
Shop System of Keeping Track of Jobs.

No. 10. Closing February 18.
Business Maxims—At Least 10.

No. 11. Closing February 18.
How Small Retailers May Keep a Record of Prices.

Connecticut Master Plumbers.

The third annual convention of the Connecticut State Master Plumbers' Association was held at New Britain on Thursday, February 9. The convention was called to order by J. H. Mills and routine business was transacted. Thirteen new members were admitted and the Baltimore resolutions adopted. The following officers were elected:

President, S. E. Dibble.
First vice president, James Ahern.
Second vice-president, J. B. Weiat.
Corresponding secretary, A. J. Clerkin.
Financial secretary, R. H. Stothart.
Treasurer, C. S. Eames.

The next meeting was appointed for February, 1894, at Hartford.

At 3 o'clock members and invited guests sat down to a banquet at The Russwin, after which J. B. Weiat, toast master, introduced the following gentlemen in turn and each responded in a short speech.

Alderman North, for the City of New Britain; Hon. Robert J. Vance, for the Press; S. E. Dibble, James Ahern, Robert Morton, Edward Smith, Soloman Goodsell, Dr. Punnell, Archibald Trolland, J. T. Duffy, Judge Chamberlain, president Union Mfg. Company, New Britain; W. B. Hubbard of Peck, Bros. & Co., New Haven; Samuel Bassett, W. E. Booth, B. E. Mallory of Richmond Stove Company, Norwich; James Donovan, Orville Jones and Walter C. English of *The Metal Worker*. Owing to the long list of speakers the remarks of all were brief, but the fact was brought out that there is considerable speech making talent among the Master Plumbers of Connecticut.

At the conclusion of the banquet a resolution of thanks to the New Britain Association was unanimously passed.

Among others the following attended:

L. H. Mills, Bridgeport.
S. E. Dibble, New Haven.
Jas. Ahern, Hartford.
Robert Brown, Norwich.
Lyman D. Mills, Middletown.
A. J. Clerkin, New Haven.
E. A. Rourk, New Haven.
W. E. Booth, Waterbury.
George Mahl, Hartford.
T. Cornwall, Bridgeport.
L. H. Beard, Bridgeport.
A. Trolland, Norwich.
L. H. Tracy, Waterbury.
E. B. Smith, Middletown.
F. C. Weiant, New Britain.
J. A. Wood, Bridgeport
H. B. Middlebrook, Bridgeport.
James Cook, Bridgeport.
C. S. Eames, Bridgeport.
Soloman Goodsell, Bridgeport.
T. E. Hogan, Bridgeport.
J. E. Littlefield, Bridgeport.
James Donovan, Middletown.
A. J. Beaton, New Britain.
P. J. Tormay, New Britain.
S. M. Laman, New Britain.
J. M. Page, Naugatuck.
E. Mahl, Hartford.
F. J. Reynolds, Ansonia.
Leonard Mallory, New London.
George W. Minor, Waterbury.
Thomas Oaks, Hartford.
J. G. Shearlock, New Haven.
Wm. Bonner, Bridgeport.
B. E. Cowles, Hartford.
J. F. Duffy, Hartford.
C. L. Snow, Hartford.
J. S. Craig, Hartford.
John Trolland, Norwich.
Wm. Kesne, New Haven.
Robert Morgan, New Haven.
Wm. Vanderman, Willimantic.
F. A. Curtiss, New Haven.
J. R. Garlock, New Haven.
W. J. Pruney, Hartford.
Geo. Cope, Hartford.
G. S. Bull, Hartford.

Notes.

Handsome badges made of satin, gold lace and metal, and bearing a representation of one of the Union Mfg. Company's pumps, were worn by members.

William Vanderman, in the dual capacity of plumber and manufacturer of plumbers' tools, came over from Willimantic for the occasion.

Of course, B. E. Mallory was there. What gathering of the trade would be complete without him? His speech was good, but all too short.

Peck Bros. & Co., New Haven, were well represented, and W. B. Hubbard's speech was well received.

A bill for the consolidation of New York and its environs on Long Island and Staten Island, as well as in Westchester County, is before the Legislature, and will provoke a long discussion.

A bill in the New York Legislature is intended to prevent the backlisting of delinquent debtors, practically giving to the latter the protection of the courts.

The bill leasing to an American syndicate the bituminous coal mines at Cape Breton passed both branches of the Nova Scotia legislature and has become a law.

Advices from the War Department at Washington intimate that both the sword and the saber may be abolished as obsolete weapons, short firearms having taken their place.

ROOFING AND CORNICE.

The Country Cornice Shop.

IV.

By Cornice Worker.

EAVE OR SNOW GUARD GUTTERS.

Fig. 32 is another form of hanging gutter for eaves with top and bottom braces bolted at A, as shown on diagram. This form of gutter is recommended on any steep roof, which is not provided with the patent snow guards now upon the market. When the thaw sets in after a heavy snow storm the snow will slide from a steep roof, often causing accidents. To prevent this there is shown in Fig. 32 a top and bottom brace, made of $\frac{3}{16}$ x 1-inch band iron, screwed to the eaves of the roofs with two wood screws through each brace. Between these braces the gutter is placed as shown, and a $\frac{1}{4}$ x $\frac{3}{4}$ inch bolt is passed through the bottom brace, the galvanized iron gutter and top brace, thus forming a solid joint at A. In practice, the bottom braces are divided as desired, and first screwed to the roof boards, as shown at B, Fig. 32. The gutter is now pressed firmly into the bottom brace and a hole punched through it at A and bolted to the upper brace. Two wood screws are screwed through the upper brace into the roof boards, as shown at C, Fig. 32. The method of forming this style of gutter was explained in Chapter III.

In bending the top and bottom braces, proceed as follows: Measure off the length of the brace required, which can be done by taking a strip of tin and laying it around the outside of the gutter, as shown in Fig. 32. Cut off as many pieces of band iron to the required length as there are braces

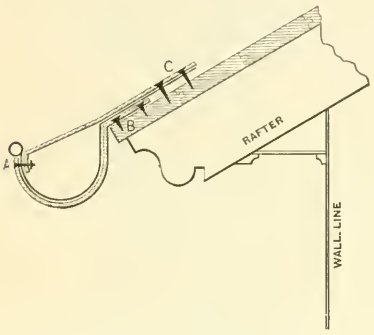

Fig. 32.—Another Form of Hanging Gutter, with Top and Bottom Brace Bolted at A.

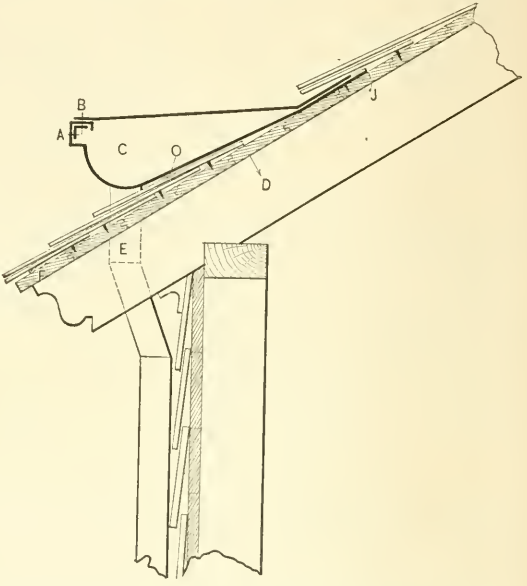

Fig. 33.—Section of Snow-Guard Gutter, Showing Method of Slating.

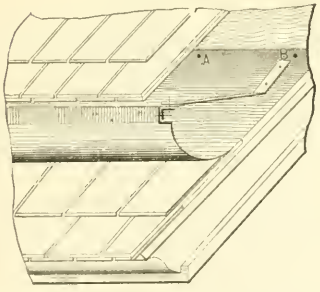

Fig. 36.—Perspective View of Roof or Snow Guard Gutter, Showing Angle Iron and Brace.

Fig. 35.—Lap on Corrugated-Iron Roof.

Fig. 34.—Angle Iron Held in Position with Hand Vise.

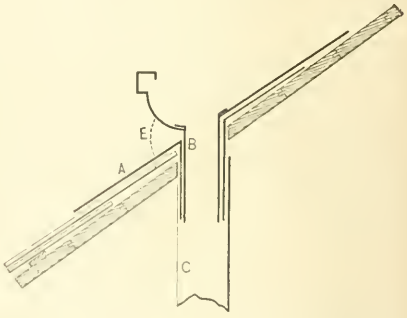

Fig. 37.—Proper Method of Making Water-Tight Joint with Sleeve, Tube and Leader.

required. In forming the bottom braces roll them through the stove-pipe former or roller until they have the required circle, after which place the brace in a vise and bend off the flange to the required angle, as shown at B, Fig. 32. One-quarter inch holes are now punched by hand or machine, at A and B, so as to admit the bolts and wood screws. The top braces are made in the same manner, and ¼ inch holes punched in them at A and C for bolts and wood screws. When this gutter is completely finished it can sustain quite a pressure. The snow sliding from the roof obtains a hold in the gutter and the braces prevent the gutter from breaking down.

SLATING IN ROOF OR SNOW GUARD GUTTERS.

In Fig. 33 is shown a section of a roof or snow guard gutter, also the method of

upon at once gives the position where the lowest point of gutter will be placed and the number of courses of slates required. Referring to Fig. 33, it will be seen that the slater must put on four courses of slate counting the course under eaves (if the leader was placed higher or lower the number of courses of slates would be more or less, respectively) After the lower four courses of slates are in place the slater must stop until the gutters are set. It is usual to give about 4 inches pitch to about 20 to 25 feet of gutter.

ANGLE IRON AND BRACES.

The style of gutter shown in Fig. 33 has an angle iron of ¼ x 1¼ x 1¼ inch in size and lighter, bolted through the galvanized iron gutter and top brace. The top braces are usually bolted about 30 inches from centers, and are made of $\frac{3}{16}$

the angle iron at B, Fig. 33, a wood screw or two is screwed through the top brace at J. The slate roof is then started again, in the same manner as described for the eaves. The method for forming the gutter, shown in Fig. 33, is done in the same manner as described in Chapter III.

ROOF COVERING OTHER THAN SLATE.

If the roof covering, as shown in Fig. 33, were to be of shingles the same rule would be followed as for slate. If tin were used, then tin up the roof as far as shown at D, Fig. 33, and set the gutter in its right position. As the gutter is to set to a given pitch, the upper edge of the gutter J, Fig. 33, would be cut on a straight line, struck by means of a chalk line and chalk, and then a lock attached, as shown by J K, Fig. 40. The tin is now

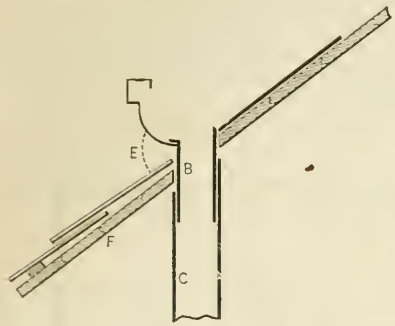

Fig. 38.—Improper Method of Making Joint.

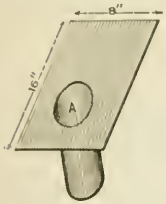

Fig. 39.—Metal Shingle with Sleeve Attached.

Fig. 41.—Wrought-Iron Leader Hook.

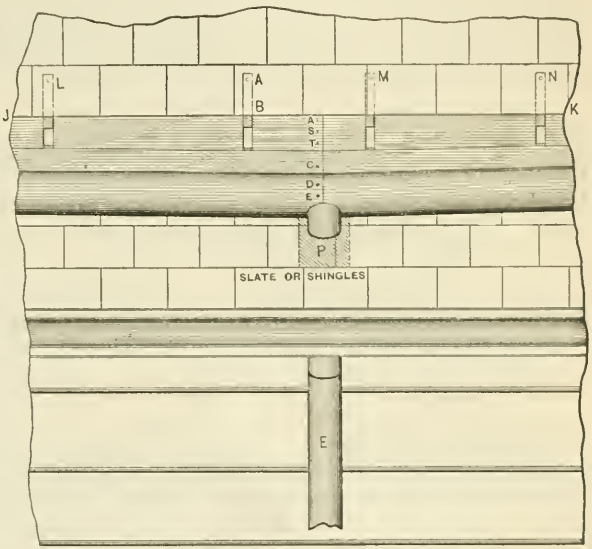

Fig. 40.—Front View of Roof or Snow-Guard Gutter.

THE COUNTRY CORNICE SHOP.

slating it. To give a better explanation of this diagram the method of starting a slate roof will be explained. As this is a little out of the line of cornice work, it is better if we understand it in case the slate roofer would desire to know how many courses he should slate before the gutter is put on. Before starting a slate roof the roofer should see that a cant strip is nailed about 1 to 2 inches above the eave line of slate, as shown at F, Fig. 33. This strip should be about ¼ inch in thickness and 1½ inches wide, the ordinary plaster laths being satisfactory. If the slates used are 8 x 16 inches in size, the first course should be laid the 16 inch way, or, in other words, the length of the slate should be laid parallel to the eave line of the roof. The second course and all others will be laid the 8-inch way. In laying 8 x 16 inch slates it is usual to lay them 6 inches to the weather, by which is meant, the second course will overlap the first 10 inches and the third course will overlap the first 4 inches. Let E, in Fig. 33, represent the leader, which we desire to place in the position as shown. The place of the leader being decided

or ¾ inch x 1¼ or 1-inch band iron respectively, and are galvanized after being made.

In putting up this form of gutter, the angle iron is left out until the gutter has been placed in its proper position on roof, and tacked with a few roofing nails, as shown by A and B, Fig. 36. After the gutter is set to the right pitch, the angle iron is pressed up into the inside top edge of the gutter and held in position with a few hand vises, as shown in Fig. 34, until the bolts are inserted, after which the hand vises are removed. If a punching machine is not at hand, the holes in the angle iron and the top braces can be punched by hand, by having a female die placed on a solid block of iron or wood, so that when the punch is being driven from the top there will be no springing.

The holes in the top braces to receive the wood screws can be countersunk by means of a breast drill if a machine is not at hand. The breast drills, including the punches and dies, can be purchased of any dealer in tinners' and cornice-makers' tools. After the top braces are bolted to

locked on to the flange of gutter and the roof tinned up.

If the roof were of corrugated iron, the sheets would be allowed to extend up as far as D, Fig. 33, and cut off square, by means of corrugated shears, which may be obtained from any dealer in tinners' tools. The gutter would now be set to the proper pitch, on the top flange of which a lock would be made as before described, it not being necessary in this case to cut the flange straight. This lock would prevent the snow from driving up under the corrugations. In laying a corrugated iron roof, as much lap should be given as is shown in Fig. 35. In tile roofing the same method would be employed as described for slating.

It is very advisable, if the roof covering is of slate, tile or shingles, to lay a sheet-rubber cushion, not less than $\frac{1}{16}$ inch in thickness, between the bottom of the gutter and top of the slate, tile or shingle, as shown at O, Fig. 33, to prevent breakage in case a large amount of snow would slide into the gutter. The rubber should be as wide as the part of the galvanized-

iron flange of gutter that lies against the slate.

Fig. 36 is a perspective view of roof or snow-guard gutter, showing the slates in position above and below the gutter, also the angle iron and brace bolted in position, and top brace screwed on the roof board, through the gutter flange.

CONNECTING GUTTER TO LEADER.

Let us assume that the gutter is to be connected to a round leader. In Fig. 37 is shown the method of obtaining a water-tight joint on roof, with the use of sleeve, tube and leader, and in Fig. 38 the improper method of making a joint, with the use of the tube and the leader only. It is of great importance that this method of putting in the sleeve be understood, as by not using the sleeve a leak is often the result. In Fig. 37, let A represent the sleeve, B the tube and C the leader. It will be noticed that both the sleeve and tube go inside of the leader, so that in case the snow drives against the angle E and thaws it must drip inside of the leader; while, as shown in Fig. 38, the snow driving against the angle E when thawing, soaks around the wood work F and rots it at every storm, because the tube B only connects to the leader C. In Fig. 39 is shown a perspective view of a metal shingle having sleeve attached. These shingles are to be cut to the size of the slates used, in this case 8 x 16 inches, and laid in with the course, where the roofs are covered with slate, tile or shingle. The sleeve shown at A, Fig. 39, should be soldered to the shingle where required; that is, just according to how the leader would be situated. In case the leader is so situated as to strike the bottom, center or upper part of slate, the sleeve A would have to be placed accordingly.

At P, in Fig. 40, is shown a shingle with sleeve attached, slated in as required, the leader having in this case cut the shingle in the center. The tube of the gutter passing through the sleeve connects to the leader below at F. In fastening the leader F the ordinary hooks are used, as shown in Fig. 41, which can be made by any blacksmith or purchased of dealers in tinners' supplies. There are different forms of leader hooks and fastenings with ornamental coverings, which will be fully explained and illustrated in another chapter.

FINISHED FRONT OF GUTTER.

In Fig. 40 is shown part of a front view of a roof, or snow-guard, gutter, finished complete, the section of which is shown in Fig. 33. L, A, M and N represent the braces of gutter, the dotted lines representing that portion of brace which is covered over with slate, tile or shingle. C, D and E represent the rivets in the joint of gutter, and R, S and T the tinned or brass wood screws screwed into the roof boards through the flange of galvanized iron and soaked well with solder.

Machine Works of Geo. A. Ohl & Co.

As makers of cornice and sheet-metal workers' machinery in general, the firm of Geo. A. Ohl & Co. of Newark, N. J., are well known to the trade. Their new machine shops and foundry, built in 1890, are located at 157–161 Oraton street, Newark, close to the Passaic River, and adjoining Woodside station on the Paterson branch of the Erie Railroad. With this line the works are connected by means of a side track. The shipping facilities by land and water are, consequently, very favorable.

In respect to general arrangements, the company's shops have been very judiciously planned, and are well adapted for the purposes of the manufacture conducted in them. We give herewith a ground plan of the machine shop, showing the general arrangement, position of the various tools, &c., in detail.

The works consist of a two story main building fronting on Oraton street, 200 x 40 feet in dimension, and a foundry building in the rear. The structures being placed on a sharp declivity, both floors are approachable directly from the outside. In the front a driveway leads into the upper story, and in the rear goods are shipped and material is received by railroad trucks on the company's private switch.

The lower floor is occupied by the machinery, the greater part of which is of home design and manufacture. A notable exception is, however, a new 20-foot planer, made in the Gleason Machine Tool Works of Rochester, N. Y. It weighs 22,000 pounds and is used for planing the 10 foot shears and brakes. Near by is placed a large 48-inch lathe, while a 3 ton jib crane handles the material for both tools.

Three other large-sized planers and half a dozen lathes of various dimensions occupy positions in the shop, besides other machine tools of different kinds, shapers, shears, drill presses, boring mills, trip hammer, &c. The position of these tools will be seen on the accompanying plan. A traveling overhead crane, which traverses the shop, and a second jib crane, provide the transporting facilities for heavy loads.

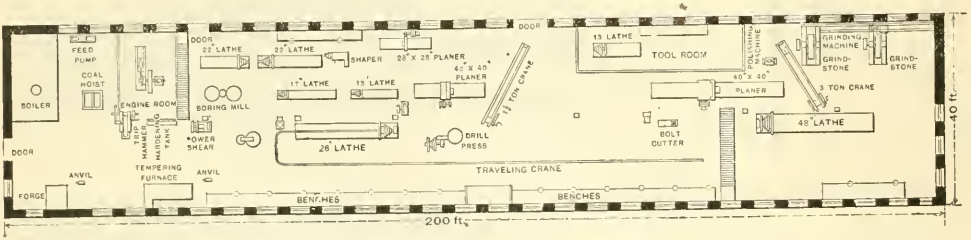
The department for grinding and polishing shear blades is a feature to which special attention has been paid. It includes two grinding wheels and one emery machine, together with a special furnace for tempering and a tank for hardening knives up to 12 feet long. The furnace is built on a plan designed for the purpose by W. Ohl.

Finished goods, if to be kept in stock, are hoisted on to the upper floor through a trap door. Those which require immediate shipment are loaded on to the cars directly from the rear end of the ground floor. A 30 horse power horizontal engine supplying the power is situated at one end of the basement.

The second floor of the building is used as a pattern shop and storeroom for material and finished goods.

The firm of Geo. A. Ohl & Co. were established in Newark in 1874, and commenced, at that period, the manufacture of the Calvin Carr cornice machinery. After the death of Mr. Carr in 1884, the patent rights in his machines were acquired by Geo. A. Ohl, who has since that time turned his attention to their improvement and to the invention of sheet-metal working machinery in general. Thirty or more different patented machines in this line are now being manufactured at the works, the latest improvement being a novel lifting apparatus for a drop press, which has just been perfected. By the device in question, a 4 x 2 foot hammer, 2500 pounds in weight, is easily and speedily operated. The sheet-metal machinery manufactured by the concern includes brakes, shears, squaring shears, miter cutters, punches, presses, rolls, benders, &c. They also turn out a number of special machines in other lines, and are makers of patent rolling steel shutters and a special line of shaking and dumping grates.

At the time the present factory was built the company was incorporated, with



Ground Plan of George A. Ohl & Co.'s Machine Works.

George A. Ohl as president, the employees, we understand, being all admitted to a share in the profits of the concern. This co-operative system has been found to work admirably after nearly three years' trial, the men taking a personal interest in their work. Beyond this, the individual interest in the concern possessed by each workman is found to obviate the frequent changes and loss of valuable help.

FLASHINGS.

AN EAVE TROUGH PROTECTOR, consisting of an extension over the upper portion of the trough of a metallic sieve having meshes of such a character that the water may readily pass through, while leaves and other *débris* would be excluded from the trough, has been patented by Newton J. Planthaber of Sterling, Ill. The sieve is bent downward at one side over the usual trough bead and at the other side over a flange formed on the exterior of the inner edge of the trough. A one-half interest in this patent has been assigned to Alexander J. McNeil of Rock Falls, Ill.

WE LEARN from Charles J. Collings, who was in New York last week representing J. M. Robinson & Co., Cincinnati, Ohio, that his firm have recently taken some large orders, among them being machinery for corrugating plants at Huntingdon, W. Va., Philadelphia, St. Louis, East St. Louis and Chicago.

THE CHATTANOOGA STEEL ROOFING COMPANY have succeeded the Cambridge Roofing Company of Chattanooga, Tenn., having purchased their factory, stock and all rights and business. The management

will be continued under J. E. Annis. The new company will make a specialty of Crowl's patent steel roofing, but will also manufacture a full line of corrugated and V crimped iron roofing and siding, standing seam iron roofing, iron weather boards, painted, galvanized and tinned. They will also carry a full stock of mixed and roofing paints.

FRIEDLEY & VOSHART are about erecting at the corner of Mather and Halstead streets, Chicago, a three-story structure for the purpose of providing additional facilities for their business. The plans, provided by architect D. H. Lapointe, call for a building 50 x 150 in size, constructed of brick and having an iron roof. The cost is placed at $16,000.

LEWIS S. SIMS of Newark, Ohio, has patented a roof gutter which is struck from a single piece of sheet metal. It comprises a hollow molding having convoluted rear side and a plain rear side or back adapted to be sprung toward or from each other. A flange is connected to the lower edge and front side, and is provided at its extremity with a facing lip. There is also a flange connected to the lower edge of the rear side for the purpose of securing the gutter to the roof and to adjust the separation of the front and rear sides of the molding.

Standard Gauge for Sheets.

Our Washington correspondent writes:

It was expected that the Speaker would recognize Representative Chas. W. Stone of Pennsylvania Monday for the purpose of moving to suspend the rules and take up his bill for "establishing a standard gauge for sheet and plate iron and steel," but the opponents of the bankruptcy bill resorted to filibustering, which prevented the Speaker from giving Mr. Stone the promised opportunity.

The following is the complete report of the Committee on Coinage, Weights and Measures on the Stone bill, which contains much explanatory matter of value and interest to the producers and consumers in the line of metallurgical products concerned:

The Committee on Coinage, Weights and Measures, to whom was referred the bill (H. R. 8099) entitled "A bill establishing a standard sheet and plate gauge," respectfully report:

Your committee have carefully considered said bill, and, while its purpose and general outline are worthy of approval, its details and modes of expression are, in the opinion of your committee, so far capable of improvement that they report the accompanying bill as a substitute for the one committed, and recommend its passage.

The purpose of this bill is to establish an authoritative standard gauge for the measurement of sheet and plate iron.

A gauge is as necessary to the manufacturer, the workman and the dealer in sheet iron and steel as a yardstick to the dry goods merchant or scales to the grocer. Contracts between the manufacturer and workmen and sales and purchases are all based upon and regulated by the terms of a gauge. This gauge designates by certain numbers the different thicknesses of the iron plates and sheets. There is, however, in this country no uniform or standard gauge, and the same numbers in different gauges represent different thicknesses of sheets or plates. This has given rise to much misunderstanding and friction between employers and workmen and mistakes and fraud between dealers and consumers.

There are probably a dozen different gauges in use in the United States and no two are alike. Those best known and in most general use are the New Birmingham, the Old Birmingham, the Brown & Sharpe and the Amalgamated Association gauge. All use descriptive numbers to designate the different thicknesses of plate and sheet, but in no two does the same number indicate the same thickness. For instance, No. 28 in the New Birmingham gauge designates a sheet .0156 inch thick and weighing 10 ounces to the square foot, while the same number in Brown & Sharpe's gauge designates a sheet .01264 inch thick and weighing 8.08 ounces per square foot. No. 27 in the Amalgamated Association gauge designates a sheet .018 inch thick and weighing 11.5 ounces per square foot, while No. 27 of Brown & Sharpe's gauge describes a sheet 0.1419 inch thick and weighing only 9 072 ounces per square foot. Here is a variation or difference of over 20 per cent. between gauges in actual and general use. No. 29 of the Amalgamated Association gauge would be only No. 27 of Brown & Sharpe's gauge. The confusion, uncertainty and injustice thus produced in business transactions can hardly be estimated. One gentleman states, as an illustration, that in a single contract made by him it would make a difference of $40,000, dependent upon what gauge regulated its performance.

The workman having in mind the Amalgamated Association gauge or the New Birmingham gauge when he made his contract would lose nearly a quarter of his wages if compelled to settle by the Brown & Sharpe gauge.

The purchaser ordering simply by the descriptive number might be forced to receive sheets thinner and lighter by one-fourth than he understood he was contracting and probably paid for.

The United States imposes tariff duties on sheet iron and steel by their descriptive gauge numbers, but there is no legal, authoritative standard for determining just the thickness of sheet their numbers describe if dispute should arise. The practice of describing the different thicknesses of sheet and plate iron by gauge numbers has been so long established and become so universal, both here and in Great Britain, that it is not deemed advisable to change this mode of designation, but these descriptive gauge numbers ought to have the same meaning and significance at all times and under all circumstances.

To accomplish this and furnish a legal guide in the collection of Government duties, the United States should establish a legal standard gauge, and that is the object of this bill. None of the existing gauge tables or scales exactly meet the requirements of accuracy and convenience, nor rest on a systematic basis, but the one submitted by your committee in the bill which they recommend as a substitute for the one referred to them is believed to fully meet these requirements.

It is based on the fact that a cubic foot of iron weighs 480 pounds. This is the same basis on which the imperial gauge of Great Britain rests, and also the New Birmingham and Amalgamated Association gauges.

A sheet of iron 1 foot square and 1 inch thick weighs 40 pounds, or 640 ounces, and 1 ounce in weight should be $\frac{1}{640}$ inch thick. The scale has been arranged so that each descriptive number represents a certain number of ounces in weight and an equal number of six hundred and fortieths of an inch in thickness, and the weights, and hence the thicknesses, have been arranged in a regular series of gradations. A micrometer for measuring the thickness of sheets and plates can be constructed to indicate six hundred and fortieths of an inch as easily as one thousandths, and thus the measurement of a sheet of iron will give the thickness in six hundred and fortieths of an inch in weight in ounces at the same time.

It is probable that the adoption of this gauge will gradually lead to the abandonment of the numbers and the use of the number of ounces in weight per square foot as the descriptive terms of the different thicknesses of sheet and plate iron. It will become as easy to order a 20-ounce sheet as a No. 22, or a 10 ounce as a No. 28, and this will cause a more general and intelligent comprehension of just what is being contracted for, and the opportunity for mistake or fraud growing out of an uncertainty of designation will be removed.

A natural consequence also will be the substitution of such weight designation for the arbitrary methods now in vogue of describing tin and terne plates as IC, IX, IXX, DC, DX, &c.

In view of the fact that the metric system of weights and measures is made lawful in the United States by statute, and the gauges in use in France and most of the European countries are based on this system, it has seemed proper to give the equivalents in the terms of that system of the different descriptive scale numbers. This is urged by the American Society of Mechanical Engineers, and is simply a matter of computation made in accordance with the law on that subject, and has been verified by the Superintendent of the Coast and Geodetic Survey having charge of the standards of weights and measures and matters relative thereto.

It is proper to say that the gauge embraced in the substitute bill recommended by your committee has been agreed upon by the Amalgamated Association of Iron and Steel Workers, the Association of Manufacturers of Sheet Iron and Steel, and the National Iron Roofers' Association as the best practical gauge, and representatives of these associations appeared before your committee urging its adoption. It has been submitted to the Superintendent of the Coast and Geodetic Survey, who is also Superintendent of Government Standards of Weights and Measures, and is approved by him, with a provision for a tolerance or variation which has been added at his suggestion. It is also approved by the Secretary of the Treasury.

Your committee therefore recommend the passage of the substitute bill herewith reported.

WASHINGTON, D. C., January 24, 1893.

SIR: Referring to the personal interview had with you in regard to the proposed bill establishing a standard gauge for sheet and plate iron, I have to state that an examination of said measure satisfies me that it will be productive of uniformity and convenience so far as it may be applicable to customs matters, and I therefore see no objections to the passage of the bill. Respectfully yours,

CHARLES FOSTER, Secretary.

Hon. CHARLES W. STONE,
Committee on Coinage, Weights and Measures, United States House of Representatives, Washington, D. C.

U. S. COAST AND GEODETIC SURVEY,
OFFICE OF THE SUPERINTENDENT,
WASHINGTON, D. C., January 23, 1893.

DEAR SIR: I return herewith the proposed bill for establishing a standard gauge for sheet and plate iron, with such corrections in the table of weights and thicknesses as are required to remove any inconsistency in the several equivalents. In its present condition I see no objection to its becoming a law and, as far as I am informed, no practical difficulty in its enforcement, provided a small, reasonable tolerance is allowed in the application of the table.

I am still of opinion, however, that it should be in the interests of justice to have such tolerance defined and fixed by law.

I am, very faithfully,

T. C. MENDENHALL, Superintendent.

Hon. CHARLES W. STONE,
House of Representatives.

The following is the text of the bill referred to in the report:

A BILL ESTABLISHING A STANDARD GAUGE FOR SHEET AND PLATE IRON AND STEEL.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That for the purpose of securing uniformity, the following

is established as the only standard gauge for sheet and plate iron and steel in the United States of America, namely:

Number of gauge.	Approximate thickness in fractions of an inch.	Approximate thickness in decimal parts of an inch.	Approximate thickness in millimeters	Weight per square foot in ounces avoirdupois.	Weight per square foot in pounds avoirdupois.	Weight per square foot in kilograms.	Weight per square meter in kilograms.	Weight per square meter in pounds avoirdupois.

37	17-2560	0.006640625	0.16867 1875	4¼	0.265625	0.1205	1.297	2.87
38	1-160	0.00625	0.15875	4	0.25	0.1134	1.221	2.69

And on and after July 1, 1893, the same and no other shall be used in determining duties and taxes levied by the United States of America on sheet and plate iron and steel.

Sec. 2. That the Secretary of the Treasury is authorized and required to prepare suitable standards in accordance herewith.

Sec. 3. That in the practical use and application of the standard gauge hereby established a variation of 2½ per cent. either way may be allowed.

Representative Stone has an interesting collection of gauges showing the differences between the thicknesses in vogue among English and American manufacturers.

BUSINESS ITEMS.

William Reisinger & Son, 612 Columbia avenue, Baltimore, Md., send to the trade an attractive calendar for the current year. The publication is a handsomely-decorated card, which calls brief attention to the firm of Messrs. Reisinger & Son, besides carrying calendar sheets for the year. On the back of the card are lists of goods which the firm keep in full assortment, and, what is of further local interest, the directions for reaching their store from different parts of Baltimore.

Alonzo and Edward Bedell have succeeded to the stove and tinware business of John Turnbull at 87 Main street, Haverstraw, N. Y., and will continue the business under the firm name of Bedell Brothers. An announcement, which bears date of February 6, calls attention to the changes which have been made in the ownership of the establishment.

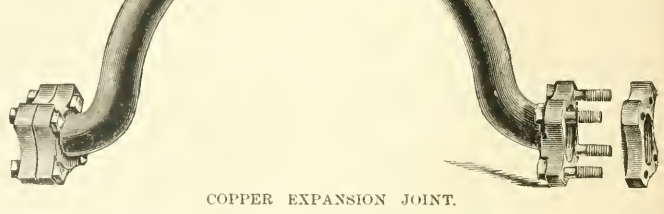
The hardware firm of Chedell & Co. of Auburn, N. Y., have retired from business, and have been succeeded by the Dunning Hardware Company. The head of the new concern is Henry S. Dunning, formerly a partner in the hardware firm of Dunning & Co. Clarence U. Chedell and Goldsborough C. Smith are the retiring members of the firm. This change obliterates one of Auburn's oldest business landmarks. It was started away back in the '30's by Joseph Hyde and J. L. Watrous, under the name of Hyde & Watrous. It was afterward continued by Mr. Watrous alone. The late D. M. Osborne became a partner about 1850, when the firm was changed to Watrous & Osborne. L. H. Baldwin entered the store as clerk in 1851, and one year later was admitted to partnership under the firm name of Watrous, Barker & Baldwin. Mr. Watrous was the next to retire, and the firm changed to Osborne, Barker & Baldwin. Mr. Osborne next disposed of his interest and went to Buffalo to engage in the manufacture of mowers. He was succeeded by Mr. Barker, and the title was again changed to Barker & Baldwin. The next change took place a few years later, when the firm became Baldwin & Co., the company consisting of E. D. Woodruff and John H. Chedell. After a few years Baldwin & Chedell succeeded to the business. Mr. Baldwin died in 1864, and Chedell & Co. became the title. Upon Mr. Chedell's death he was succeeded by William Williams, who died in 1885, and then the firm name reverted to Chedell & Co. again, and continued until the latest change, the Dunning Hardware Company.

F. O Alsop, Syracuse, N. Y., announces that after 20 years' experience in the hardware and stove business he is prepared to furnish the trade directly, as manufacturers' agent, with all goods in those lines. Mr. Alsop states that he handles a full line of ranges, parlor and globe stoves, including the Popular and New Daisy oil stoves and the Daisy lamp stove, as well as stove repairs of all kinds and mica, rubber hose and belting, &c. He makes a specialty of water fronts for all the standard makes of ranges.

William A. Requa, formerly with Maurice E. Viele, the Albany, N. Y., hardware dealer, has purchased an interest in the hardware business of J. H. Cornell of Middleburg, N. Y. He is an experienced man in the Hardware line and has many friends who wish him success.

Copper Expansion Joint.

The Dame & Townsend Company of 76 John street, New York, are now making the copper expansion joint, of which an engraving is presented. The joint is made of annealed copper pipe, with a patent cast-iron reversed flange union expanded on each end. The expanding of the copper in the recess of the flange forms the packing.



COPPER EXPANSION JOINT.

In Ohio the labor unions, by addressing circulars to workingmen, have induced so many to leave military organizations that some of the regiments of National Guards are much weakened, particularly the First Regiment from Cincinnati, and they might not be very efficient in quelling disorder.

Some of the Canadian Government organs are not as amiable as they were. Last week a dispatch was telegraphed from New York that Professor Goldwin Smith of Toronto intended to call on Mr. Cleveland to obtain, if possible, "a better market" and "freer trade." The government organ in Toronto, referring to this circumstance, speaks of the "renegade Englishman," and is "not sure but even in these days of leniency he has gone far enough to bring him within the law of treason." Clearly enough Mr. Smith's efforts are not appreciated.

Manufacturers in Findlay who had contracted for natural gas supplies disregarded a notice served upon them to substitute oil wherever it was possible. So last week when a secret tour was made by the natural gas superintendent a charge followed that 50,000,000 feet had been stolen during the past month. Now there is trouble.

"The Metal Worker" Competition in Skylight Pattern Cutting.

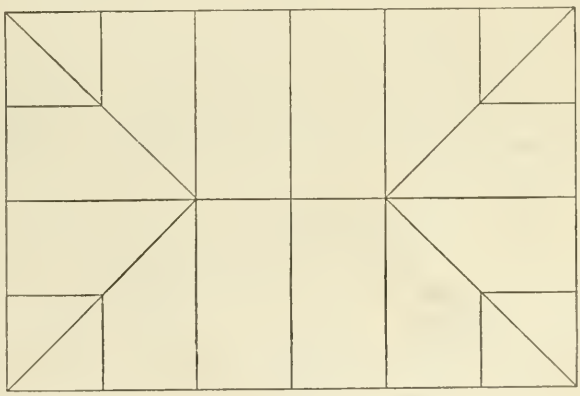
FOR the purpose of calling forth from the readers of *The Metal Worker* the best method for obtaining the patterns of a hipped sheet-metal skylight and to advance the art of pattern cutting, it has been decided to present a prize competition, the particulars of which are as follows :

Each contestant will be required to furnish the plans, elevations, necessary sections and profiles of skylight, also to design the various parts of same, giving to each part the shape that may be considered best adapted for the purpose ; drawings to be of such size as required for publication in *The Metal Worker*.

The skylight to be so constructed that the condensed moisture from below will be conveyed outside, the frame work of skylight to be made of sheet metal, and the usual thick glass to be used in connection with same ; the method of securing glass and caps to bars or rafters to be clearly shown.

While the plan may show a certain size of skylight, indicate the method by which one of similar pitch but different size can be constructed, the same miter patterns being used.

Show method of obtaining length of the various bars or rafters, using for the purpose any diagram, plan or elevation that may be necessary. Also show method of obtaining shape or section of hip bars.



Outline Plan of Skylight.

The skylight for which the patterns are required is such as would be placed over a light shaft, or on a roof or bulkhead, the size of opening being about 4 x 6 feet. As there is no particular rule governing the pitch of the skylight, it can be given such pitch as may be desired. While the wooden curb or frame of air shaft, roof or bulkhead is supposed to extend a sufficient distance above the roof to give ample opportunity for securing skylight to same, contestants will be at liberty to use such methods as appear best adapted for the purpose of fastening skylight, where brick and angle iron constitutes the frame.

The accompanying plan is not intended to give details of construction, but to indicate in a general way the shape of skylight for which drawings and patterns are required. Where there are two or more similar parts in the skylight, so that the pattern for one part will answer for the other, it will be only necessary to show details of one part. As indicated in plan, the skylight is to have a hipped roof, and as previously stated, the roof can be given any desired pitch.

PRIZES.

In the contest above described, two cash prizes are offered, as follows :

First prize.....$75.00.
Second prize..... 50.00.

The drawings and accompanying description may be sent by either mail or express, charges prepaid, and must reach the office of *The Metal Worker* not later than April 1, 1893.

They are to be addressed as follows :

THE METAL WORKER,
96–102 Reade street, New York.
(Skylight Competition.)

Each contestant is to select a fictitious name or device, which is to be placed on the description and each sheet of the drawings. The real name and address of the writer is to be put in a sealed envelope, on which is to be placed the fictitious name or device used on the drawings. This envelope is to be inclosed with the drawings and description.

The manuscript and drawings are to be sent flat, not rolled, and the writing should be on one side of the paper only. It is also suggested that legal cap paper be used for the description, the same size of paper for the drawings, and that ink be used for writing the descriptions ; the drawings to be either ink or pencil.

The various drawings and descriptions received up to the time set for closing the competition will be submitted to a committee selected for the purpose, who will decide between competitors.

In deciding between contestants, four points will be given consideration, as follows :

1. Originality.
2. Mechanical completeness of the method proposed.
3. Neatness of drawings submitted.
4. Clearness in description.

The right is reserved to publish all the drawings and descriptions received in this competition, and also to return to the authors the drawings and descriptions received in the competition in case they are not considered suitable for publication or worthy of an award of prizes.

THE LETTER BOX.

Pumping Sulphuric Acid.

From A. D., *Montreal, Canada.*—Will some brother of the solder pot give me a pointer as to the best kind of pump to use to pump sulphuric acid? I want to raise it 14 feet and the compressed air method is not available. Are there glass or other suitable pumps made for such work?

Note.—We have heard of lead pumps made for the work of raising sulphuric acid, but where they are manufactured or whether they are regularly on the market we cannot discover. The usual method is compressed air, but this, it appears, is not available. It is barely possible that our correspondent can make use of an Archimedes screw made of lead pipe. An Archimedes screw, as our readers know, is merely a pipe wound in the shape of a spiral, or, more properly speaking, a helix, and supported at an inclination. By inserting one end of the pipe in a liquid and revolving it the water or other liquid travels up the tube and finally overflows at the top end. Another suggestion is that our correspondent use an ordinary wooden pump, replacing the valves with hard rubber. This would give satisfactory results for a little while at least, and may be the work in hand is not to extend over any long time. If our correspondent is an ingenious workman we suggest that he manufacture a pump for himself out of lead, using different sizes of pipe for the cylinder and plunger rod, &c. We wish some of our readers who have had experience in this line and who may be in a position to offer serviceable suggestions would loan their experience for the benefit of our correspondent.

Estimating Cost of an Article.

From B. C., *Hamilton, Ont.*—What is the best method for arriving at the percentage of expense to be added to an article when estimating the cost?

Answer.—The cost of doing business is generally from 10 to 25 per cent. of the gross sales per year. If the exact cost of doing business for the previous year is not known, it is safe to estimate it at 20 or 25 per cent. This includes interest on capital, rent, clerk hire, light, fuel, stationery, postage, &c. Whatever percentage of the sales these expenses are must be added to the cost of the goods. In addition to this the cost of freight, drayage and boxing must be added to the cost of each article. The percentage of freight to be added to each article of an invoice may be determined in either of two ways: First, by determining what percentage the freight is of the whole invoice; second, by determining the percentage of freight on each class of goods in the invoice. The invoice cost of the goods, plus the percentage cost of doing business, plus the percentage cost of freight dray and boxing, represents the cost of goods on shelf in the store. The selling price marked on the goods should represent a legitimate profit.

Material for Gutter.

From S. S., *Marcellus, N. Y.*—I intended to send you a letter in reply to "W. L. M.," Sunbury, Pa., whose inquiry appeared in *The Metal Worker* of January 7, but somehow I did not get to it, so instead of writing you I am reading the replies. There is one thing that strikes me in these. I see a number recommend using paper under the tin. I did once, but I changed my mind some since. As a matter of fact, a tin roof is supposed to be tight—that is, water tight. Some are, more are not, though leaks occur in all at some time or other; some from accident, some from wear and tear or other causes too numerous to mention. Now, paper that is used under tin is one of two kinds—it is either of the sort that absorbs water or is the so-called water proof. If a gutter be lined with paper of the waterproof nature and a leak occurs at some spot in the run, the water is held by the paper under the tin, and this may extend the whole length of the gutter. Here we have a tin gutter laid in water, and the point is, what is going to happen to it? The paper keeps the air away from underneath, the tin keeps the air away on top, so the water has no chance to get out. Is it likely that the tin will not rust under such conditions? Upon the other hand, you put down paper of an absorbent nature, it holds water like a wet blanket and is worse than none. The same criticism may be made of matched sheeting boards—the tighter they fit the more resistance to water should they get under the tin.

I have found that where gutter seams break by contraction and expansion that the narrower the boards and the more open the joints, say ¼ inch or so, the better condition the gutter was in. If they laid the boards close it held the water and the gutter soon was worthless. You may talk about painting tin underneath; it is far easier to talk about it than to do it, and in fact it is almost impracticable. In some jobs of a plain nature and straight work it might be done and, in fact, I have done it, but I cannot say I like it. All things considered, I condemn the practice of using paper under tin.

Put your paper under the rafters and then ceil it over with matched lumber inside. It forms an air space. This will prevent condensation much better than placing the paper on top and under the tin. I once had occasion to place a ventilator on a new building heated by steam. The roof was of tin, rather flat, close boarded, two thicknesses of rosin-sized sheeting paper on it and no ceiling below. I found the boards so wet that I could scarcely see the hole, and the paper so wet it it could not absorb any more water, and the tin was as rusty on the under side as it was on top, where it had not been painted. I then and there made up my mind that the conditions could not be worse if no paper had been used. The roof did not leak and it was the condensation that raised the trouble.

Flux for Soldering Roof.

From B. E. H., *Philadelphia.*—A party called to see me the other day regarding a building on which a new tin roof was required about every three years. The only reason the owner could assign was, that the parties who lived in the house some years previously had used the roof to empty slops on until the tin rusted out and the roof boards had become saturated. After new tin had been on awhile it would turn white on the under side and corrode through. As a new roof was again required, the owner asked my advice regarding what material to use.

A few days previously an agent had been talking to me regarding lead coated iron, which he claimed would withstand the action of gases, &c., without detriment to the metal. Accordingly I suggested to the owner that he allow me to cover the roof with lead-coated iron, to which proposition he consented. My men took the old roof off, and by night had the new one laid, but did not get it soldered. The next day it snowed, which prevented further operations for a time. A few days afterward they went to solder the roof and found the surface of the metal covered with a dry white powder which had formed on the surface of the lead. The men had tried to solder the roof by using rosin and failed. Acid was tried with a similar result. When I arrived at the scene of (in)action the men were using language not at all complimentary to lead-coated iron. As neither rosin nor acid could be used for soldering, the idea struck me to try grease as a flux. Accordingly I procured a quantity of candles, and they worked like a charm, the entire roof being soldered by their aid. I would be pleased to have the readers of *The Metal Worker* inform me of some better way of soldering lead coated iron, under the same conditions, should I have the misfortune to be caught in the same fix again.

Paint for Oil Tanks.

From A. R., *Ohio.*—What kind of paint is used for painting 60-gallon oil tanks?

Answer.—A manufacturer of oil tanks to whom the above question was submitted replied as follows: When sheet-metal oil tanks are to be painted, first give them a coat of mineral paint. After this has dried apply one or more coats of lead paint, using such color as may be required. If it is not desired to finish with varnish, mix a little varnish with the last coat of paint applied.

Removing Japan from Castings.

From A. G. S., *Hannibal, Mo.*—How can the japan be removed from old gasoline stove frames so they can be rejapanned?

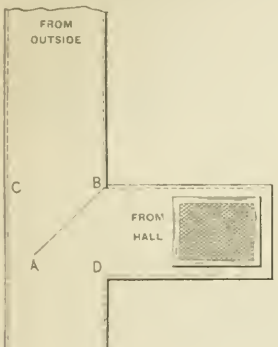
Answer.—If the article is of such a shape as not to be injured by heat, the old japan can be removed by holding the article over a fire and heating until the

japan scales off. If it is not desirable to use heat, then the japan can be removed by means of a sharp scraper or file, the object being to secure a smooth surface.

Air Supply for Furnace.

From F. V. P.—When a house is to be heated by means of a warm-air furnace, and the cold air supply is derived from a lower room or hall, will the air be as pure and the furnace give as good satisfaction as when the air is taken from outside?

Answer.—When the air supply for a furnace is taken from a lower room or hall of a house, and the only source of fresh air is that derived from the cracks about windows or doors, or from the occasional opening of them, the supply of fresh air is of course very uncertain, and with houses as usually constructed would hardly be sufficient. On this account the air might not be as pure as desired. When outside air is conveyed to the furnace by means of a properly constructed duct a



Cold Air Supply for Furnace from Hall or from Outside.

constant supply of fresh warm air should be delivered to the rooms above, providing proper provision has been made for the removal of foul air. This should be done in either case. By continually reheating the air in a house, as done when the air supply is taken from a room or hall, less fuel would be required than when the fresh cold air is taken from outside. This condition would perhaps be satisfactory to many. It would appear that by the first method we would secure economy of fuel and by the second an abundant supply of fresh air. It is the practice with some furnacemen to put in a cold-air duct in such a manner that either of the above methods can be used as desired. This may be found convenient, as it is difficult to maintain as much fire during the night as during the day. As shown in the accompanying engraving, the cold-air duct leading from outside to furnace has a branch extending to register face placed in hall. The valve A B is so constructed as to swing at B. When the valve is swung to C, the air is taken from hall. By turning the valve to D, the air is taken from outside. By having the valve hung in the above manner the air supply to furnace cannot be shut off, as might be the case if each opening was provided with a separate valve.

Cash Handling System In Retail Stores.

From M. C. & Son, *Plymouth, Mich.*—We would like to know the most satisfactory system for handling cash in a small retail store. We use a receipt like the one inclosed for payments on account. They are bound four on a page, and we give one to every one who pays on account. We find this method a very good one for that part of cash.

Note.—The form of receipt forwarded by our correspondent is as printed below:

We shall be glad to receive from any of our readers suggestions on this subject, or information as to cash-handling methods pursued by them in their retail business which they may find to work well.

Size of Flues.

From E. L. J., *Brooklyn, N. Y.*—How large need a flue be to make a good draft for an 8-inch pipe, also is it an advantage to have flue pipes made of copper rather than of galvanized iron. Will copper corrode?

Answer.—Flues, as ordinarily built, either square or rectangular in shape on the inside, to meet the requirements of an 8-inch round pipe, should be no smaller than 7 x 8 inches, or nearly square. An 8 x 10 inch flue provides an abundant area for the full capacity of such a pipe. A narrow flue, as, say, 4 x 14 inches, or a flue with a much larger area than that of the pipe, will not in most instances prove as satisfactory and give as perfect a draft as one built nearly square in section within the measurements as stated. We do not see any particular advantage to be gained by making flue pipes of copper if used for no other purpose than to convey smoke. If our correspondent should intend to make a smoke stack on a chimney, we would advise him to use galvanized iron rather than copper. A chimney stack made of copper exposed to wind and weather would cool more rapidly than one made of galvanized iron, and would chill the ascending current of heated gases, and so retard the draft to a greater extent than would be the case with galvanized iron. As to the lasting qualities of the two metals, the copper stack would probably outlast the one made of galvanized iron, the action of the various gases in contact with the metal corroding the iron to a greater degree than it would the copper. Copper, however, is not imperishable, but is also subject to corrosive influences.

Radiator and Water Front.

From F. P., *East Fairfield, Vt.*—Please inform me, through the columns of *The Metal Worker*, if a radiator may be connected with a water front on a range where the radiator is on the same floor with the range and where the pipe has to run under the floor from the range to radiator? A boiler is used likewise in connection with the range. The water is taken from a large tank in a room 10 feet above the range and radiator.

Note.—A radiator placed on the same floor as a range, and connected to the water front of the range, with the pipes passing under the floor from range to radiator, will not circulate. There is no way, under such conditions, to make a satisfactory working arrangement, and we would suggest that we do not think it worth the trouble for our correspondent to try to do it, assuming that we have correctly inferred the surrounding conditions from the meager explanation given.

Painting Conductor Pipe.

From M. T. Cummins, *Yazoo City, Miss.*—In answer to "G. R. C.," Mansfield, Pa., whose letter appeared in *The Metal Worker* of January 21, about painting down spouts on the inside, I would state that the method I employ I find to be very easy and clean. It is to paint the piping before getting ready for the rollers.

From T. A. D., *Everett, Pa.*—In reply to "G. R. C.," Mansfield, Pa., would say that I paint nearly all my work on both sides and my conductors I paint by dipping. I make up the stock in 5-foot sections, three joints, at a distance of 20 inches apart, in one piece. Then I have made for the purpose a trough 6 feet long out of 14-inch tin, formed up the same as a gutter. I then mix the paint and put about 3 gallons in the trough. Then take one section at a time and lay it in and give it one turn and stand it up on end in a trough made for the purpose. By this method a lot of conductors can be painted both sides in a very short time. It will be found, however, that mixing the paint is the most particular part of the job. I am confident that if "G. R. C." will try this plan he will find it a very satisfactory one.

Lines of improved barges adapted to the transportation of all kinds of merchandise are to be run from New Orleans to St. Louis, Cincinnati and Pittsburgh in the belief that imported goods from Europe can be distributed in this way through the country as cheaply as from New York.

STOVE TRADE NOTES.

The Stove Exhibit.

It will probably be some time before the question of the stove exhibit at the World's Columbian Exposition is satisfactorily settled. The allotment of 20,000 square feet to the stove trade is found to mean something different from what had been originally supposed. The intention of the World's Fair authorities is to concentrate within this space not only the exhibits of stove manufacturers, but also all other kinds of cooking and heating apparatus of whatever fashion or character, without regard to fuel used or methods employed. This covers an enormous variety of products, when it is considered that almost every manufacturer of heating or cooking apparatus has some distinctive feature which he would like to make prominent on such an occasion. But, as if this group were not enough for such a limited space, room must be reserved in it for exhibits of house-furnishing goods, which opens up another almost boundless field of aspirants for recognition. Attempts are being made, we learn, to ascertain at the earliest possible day the exhibitors who are sufficiently satisfied with the space they can get to go on and make preparations for a display. They will then be asked to contribute *pro rata* to a fund for the erection of an artistic pavilion or building to inclose the whole space. It is possible that some may prefer to drop out altogether, rather than pay any considerable sum toward the erection of a pavilion, deeming the expense incurred in preparing their individual exhibit as large as they care to invest for such a purpose. There would then be space to reallot, and perhaps considerable changes may take place in this way before everything is in good shape for the exposition. At present little can be said with regard to this matter, although the rapid flight of time and the now near approach of opening day render it desirable that all particulars should be settled irrevocably.

ODD PLATES.

The Brand Stove Company of Milwaukee and Chicago are bringing out a full line of steel-plate French ranges. Specimens are now displayed on the floor of the company's Chicago sample room. They are handsomely made, finished with broad nickel bands and nickel towel racks, or guard rails, drop oven doors, water fronts of extra capacity, shaking and dumping grates, and furnished either right or left as desired. The high warming closet is made with a rolling door, which hangs on eccentric side supports so that its own weight keeps it open. A neat device appreciated by tidy housekeepers is furnished with each range. It is a tin pot lid with a small pipe attached to the top, of sufficient length to pass into a hole in the smoke pipe, and will thus carry away odors of victuals while cooking. This hole in the smoke pipe when not in use is covered by a neat lid, which hangs over it. These ranges are made to meet the demand for wrought ranges of moderate price.

The Michigan Stove Company favor us with a novelty in the form of a chiromantic chart, setting forth rules by which an individual's character, mental temperament, business aptitude and fortune are to be told from the lines and markings of his hand. We have already studied our fortune from it, but what it will be "we dinna choose to tell." On the reverse side of the card bearing the chart, which may perhaps be the principal side in the estimation of most people into whose hands it falls, is a very quaint and pretty picture in colors, entitled "Childhood's Pleasures." The Garland trade-mark is visible, but not obtrusively so.

W. J. McKay & Co., wholesale dealers in stoves, ranges and furnaces, Chicago, send us with their compliments one of the pretty calendars with which they are favoring their customers. Leaflets for the months are attached to a white card with a gilt border, at the top of which is a colored picture of a dog of evidently good breeding. The dog's portrait is on a panel, back of which are representations of colored envelopes with their ends showing postmarks, stamps, &c. The leaflets for the months are printed in black, with Sundays and holidays in red, the distinction thus made being an excellent idea.

The Milwaukee Gas Stove Company of Milwaukee, Wis., have issued, under date of January 27, an announcement referring to the fire which burned their new factory on the night of January 25. They state that it was their intention to resume operations on February 6, temporary quarters having been secured. Their Perfection gas range for 1893 is a very pretty stove, and is shown connected with a range boiler on a sheet just at hand. It has four burners in the top plate and two boiler holes at the end carrying the water back.

Charles A. Bateman, who has been for several years with the Dighton Furnace Company, is now associated with the Smith & Anthony Stove Company of Boston, Mass. Mr. Bateman is one of the best known stove men in New England, and we are sure his many friends will receive a hearty welcome when they call on him at the headquarters of the Hub goods.

John B. Jones, secretary of the Carton Furnace Company, Utica, N. Y., is now in the West visiting their various agencies. He reports that the severe cold weather of the past winter has had no effect on the merits of the heating powers of the Carton furnaces and that all sent out during 1892 by the different agencies seem to be doing more than was expected of them.

The cupola in the new works of Noyes & Goddard, Waterville, Me., was warmed up for the first time on Wednesday, January 25, and a number of stove castings made. The company are rapidly getting in shape for business, and are looking forward to a gratifying volume of trade during the new year.

The Corning Mfg. Company of Corning, N. Y., are the assignees of a patent for a hot-air furnace granted to E. R. Stasch of that place. Provision is made for the escape of accumulated gas, the arrangement of parts being such that the air is claimed to be more readily heated, while the space occupied is small. The combustion chamber is extended laterally over a radiating chamber and provided with a vertical partition, so as to compel the products of combustion to pass first upward and then downward into the radiating chamber. The latter has a horizontal diaphragm, with an outlet beneath it for the products of combustion to pass into the flue and then escape to the chimney. Above the diaphragm is an outlet for the escape of the gases, this outlet being provided with an automatically operating valve, which is forced open by the accumulated gases and then automatically closes after the gases have escaped.

At the annual meeting of the Bellaire Stove Company, Bellaire, Ohio, on January 19 the old officers were re elected as follows: H. Roemer, president and treasurer; E. C. Boyd, vice-president; Robert Johnston, manager, and E. H. Rider, secretary. The company state that their sales during 1892 were nearly double those of the preceding year, and that the prospects for 1893 are very encouraging. Frank Shuttleworth will represent the company on the road during the ensuing year.

The Peninsular Stove Company are sending out from their Chicago office a postal card, on the back of which is printed in red in bold-faced type the following: "The tip is out. The Monarch Peninsular range for 1893, the greatest profit maker on earth. Why don't you handle it?"

In a recent issue of *The Metal Worker* we gave some information in regard to the Carpenter system of cooking and heating by electricity, with illustrations of some of the appliances used for these purposes. An article in a foreign exchange shows that the employment of electricity in these domestic offices is not confined to the United States, but has made considerable progress in England. Speaking on this subject the writer observes: Quite a large number of domestic appliances, heated by the same electric current that is supplied to houses for lighting, are now manufactured in England. Kettles, saucepans, flat irons, hatters' irons, curling tongs, were to be seen at the Crystal Palace Electrical Exhibition, but stoves for heating rooms by electricity are, we believe, a recent production. So is a detached heater, which can be put into any dish to warm the contents, from a glass of water to a basin of soup. In every instance the heat is derived from a wire of high resistance through which the current is passed, and there is neither smoke, ash nor fumes. The electric heater is as cleanly as the electric lamp, and must prove a great convenience in houses already provided with the electric current.

The Phillips & Buttorff Mfg. Company of Nashville, Tenn., will be represented the ensuing year by John W. Dill,

who will travel in their interest in the State of Texas; John B. Webber, who will cover the States of Georgia and Florida; W. W. Chappell, who will visit the trade along the Tennessee River; Whitten Duncan, who will cover Mississippi; A. B. DeBow, who will solicit orders from dealers along the Cumberland River; J. M. Adams will cover Southern Kentucky; H. C. Clark, Western Tennessee; W. H. Cox, Northern Alabama; W. H. Harley, Southern Alabama; W. M. Bennet and T. M. Jones, the middle section of Tennessee; while W. L. Clarke and J. H. McClure will cover territory not otherwise provided for.

THE SUPERIOR FURNACE COMPANY'S WORKS, at Little Falls, N. Y., have begun operations with a full force of employees. The company have secured the services of W. S. Robb, who has been connected with the Richmond Stove Company of Norwich, Conn., for many years, to take charge of making their castings.

THE DURAND STOVE COMPANY of Medina, Ohio, have resumed operations. The negotiations looking to a reorganization of the company, and which had been pending for some time past, came to a conclusion recently, and immediate steps were at once taken to put the works in running order. The size of the building occupied is 100 x 40 feet and 2 stories in hight. The ground owned by the company is, we understand, 2¼ acres, and a switch has been graded and ties laid by the P. A. & W. Railroad directly up to the works. The form of stove turned out by the company has been changed, adding greatly to its appearance, and the new management has also improved the power of the burner, which is said to increase its safety and desirability. At a meeting of the stockholders, S. H. Bradley, A. Munson, O. C. Shepard, F. M. Ashley, George Shepard, George H. Foster and James Atchinson were elected directors. At a subsequent meeting of the board A. Munson was selected to act as president; James Atchinson, vice president; George Shepard, secretary; O. C. Shepard, treasurer, and A. J. Blackford, manager.

THE IRWIN MFG COMPANY of Louisville, Ky., send us a copy of what is known as their "Illustrated Catalogue No. 2." It comprises something over 70 pages of letterpress, profusely illustrated with engravings of stoves with which they are prepared to supply the trade. The company have added to their extensive line a number of new patterns, while making improvements and additions to others. Attention is invited to the Progress, a line of steel-plate ranges embodying the modern features. Under the same name is made a line of double-oven ranges for use in hotels, boarding houses, public institutions and private residences. The D series of the Progress steel-plate range has been brought out to meet the demand for a construction of moderate size and cost. This range is the same in construction as the F series brought out by the company, and embodies the essential features for satisfactory operation. Under the name Progress is also offered a cook stove for hard coal, soft coal or wood; also one intended for soft coal or wood, and the Irwin Regal, a four-hole cook, made in three sizes and a number of varieties. Other goods include the Good-Luck Progress, for wood only; Nancy, Irwin Queen, the latter being the latest addition to the company's assortment; the Indiana, Relief and Kentuckian. The heating stoves are creditably represented in the catalogue by the Progress Todd, for burning wood, made in one size; the Wilton, a neat cottage parlor; the Oak, an attractive box stove; the Irwin Oak, for coal; the Success, Ruby, Ceres, Gem, Fulton and New Laundry. An interesting feature of the volume is a chapter on the method of obtaining the best results in the use of cook stoves.

THE NOVELTY MFG COMPANY of Jackson, Mich., are manufacturing a very extensive line of gas stoves. They are also equipped to do electro plating on a very large scale, having recently installed one of the Zucker & Levett Chemical Company's, New York, plants for this class of work.

JACOB D. GOLDSTEIN of New York City, is the patentee of an oil stove possessing many features of interest. The oil fountain has an open top which is closed by means of a removable cover, to which is attached the wick tube. There is also an upper water section which has a horizontal plate attached to the wick tube and provided with a surrounding perforated rim or flange extending downward and resting on the oil tank so that when the water section is removed it carries with it the wick tube and the cover of the oil tank.

CHARLES M. HOLLINGSWORTH of Cleveland, Ohio, is the patentee of a vapor stove comprising a closed vaporizing chamber and suitable means for delivering to it a regulated supply of liquid hydrocarbon. A conducting pipe extends downward from the vaporizing chamber, the lower edge communicating with a metallic burner shell. An inverted hood, entirely open on its under side, has one end adjacent to the burner shell and is in contact therewith below the burner cap. From this end it inclines upward toward the opposite end, while a pipe connecting with it extends upward, forming a communication with the upper portion of the vaporizing chamber.

THE ELECTRIC OIL AND GAS STOVE WORKS of 295½ Pearl street, New York City, have recently issued from the press a catalogue of 24 pages, in which illustrations are given of many of the leading goods manufactured. In offering this catalogue to the trade the company direct attention to many improvements which have been made and also to their increased assortment. The business of the company has increased to such an extent that they have been compelled to occupy more commodious quarters, and with their present facilities and large stock they are in a position to promptly fill orders. In the catalogue before us attention is invited to the New Electric oil stove, made in several sizes; the Star, made of tin and so constructed as to be readily taken apart; the Comet lamp stove, made of iron and ornamented with japan and nickel plated; the Liberty oil stove, made of cast iron; the new Rocket gas stove, made in a number of styles and sizes; the Parlor Queen, a neat heating stove fitted with burners which are said to be so constructed that they will burn without smoke or odor, and the Electric oil stove, made in sizes adapted to heat rooms varying from 12 feet square up to those measuring 15 x 20 feet.

NORTH DIGHTON CO OPERATIVE STOVE COMPANY, North Dighton, Mass., are Pushing their latest production, the prize oak range, which completes their line of first-class medium-priced ranges. W. C. Leonard succeeds W. B Hathaway as general manager of this concern.

AT THE ANNUAL MEETING of the stockholders of the Pittston Stove Company, held on Tuesday, January 31, at Pittston, Pa., the following board of directors was elected for the ensuing year: George Mitchell, Thomas Orchard, Alex. Sloan, T. F. Penman, A. C. Monies, Andrew Wyllie, E. E. Thomas. At a meeting of the above board, held subsequently, the following officers were elected: President, George Mitchell; vice-president, Thomas Orchard; treasurer, Alex. Sloan; secretary, T. F. Penman.

THE BLACKMORE HEATING COMPANY of Newark, N. J., are the assignees of a patent just granted to Joseph J. B. Blackmore of that place for a tubular hot-air furnace. In the construction of this heater the bottom of the radiator drum is set below the bottom of the fire pot, where its inner portion is protected from direct radiation from the fire pot by the outer edge of the ash box and where it is sufficiently removed from the fire pot to avoid the wide range of expansion at the joint which would result injuriously. Smoke outlets are extended through the casing from the radiator near its top and bottom, the top one furnishing the direct draft when kindling the fire. The arrangement of parts is such that the air is prevented from passing directly from the fire pot to the lower outlet by means of a deflecting plate or diagram of special construction which is inserted between the tubes at the top of the fire pot within the rear side of the radiator. This forces the heated gases to circulate around the front tubes in their escape to the lower outlet. The water box is cast integral with the lower edge of the ash box, the exterior lower portion of it forming one side of the water pan. The radiator is made in detachable parts so as to render the apparatus more portable.

PRESIDENT E. S. BARBOUR of the Detroit Stove Works, stated in an interview with a representative of a local paper that their striking stove mounters were still out, but that the company were going on as usual with a full force in all departments. He stated that they had 20,000 stoves on hand, a sufficient number to meet the requirements of their customers for some time. He said the company had made no attempt to secure new men, as they were in no present need of them. Referring to the wages they received, he said the mounters made from $2.80 to $4.50 a day, which he was sure "is as much as any stove works in the country pays men in that department."

THE HOWARD FURNACE COMPANY of Syracuse, N. Y., have established a permanent branch at 254 Water street, New York City. This step has been taken for the purpose of supplying the company's rapidly increasing trade in Eastern Connecticut, Massachusetts, New Jersey, Long Island and the territory along the Hudson River, as well as the building and jobbing trade of New York and Brooklyn. W. B. Wilkinson is manager of the New York office, as well as for the Howard Thermostat, which is controlled and managed by the Howard Thermostat Company. This interesting automatic heat regulator is shown in operation at the office of Mr. Wilkinson. The New York branch will be represented on the road by G. A. Stevens, well known to the trade as a furnace salesman, and who is now visiting his friends in the States of Massachusetts and Connecticut.

THE TOLEDO STOVE COMPANY, which are a reorganization of the Leonard Stove Company, have recently been incorporated at Auburndale, Ohio, with a capital stock of $100,000. We understand that the works at the place named are to be enlarged to double the present capacity. The incorporators of the new concern include J. C. Leonard, G. G. Metzger, H. C. King, T. Schuuck and T. H. Tracy.

ALBERT W. ALGER of Kansas City, Mo., has patented a heating stove adapted to use oil as a fuel. The parts of the device are so arranged, it is claimed, as to greatly increase the radiation of heat, while means are provided for a safe and convenient method of feeding oil to the burner.

CHARLES ADAM CHRISTIAN KORETKE of Belvidere, Ill., is the patentee of a heating stove, in which hot-air flues or pipes

are provided to increase the heating capacity. The fire pot is formed practically of pipes or flues, the bottom being an annular flue, the top a similar pipe and the side walls vertical flues connecting and communicating with the top and bottom. An annular flue is also provided near the top of the stove, and with this upper flue communication is established from the fire-pot flues.

A LARGE NUMBER of the New York State agents of the Fuller & Warren Company of Troy, N. Y., were entertained at the Troy Club February 1. Among those present were representatives of the company from New York City, Oswego, Syracuse, Rochester, Auburn, Utica and Rutland, Vt.

ASSOCIATE MANAGER EDMOND RAFTERY of the Chicago branch of Rathbone, Sard & Company is at Albany, N. Y., for a week or so. He is much better in health since his trip abroad.

THE ANNUAL REPORT filed with the Secretary of State by the Perry Stove Company of Albany, N. Y., shows the present directors to consist of Nathan B. Perry, John T. Perry, George W. Hobbs, William E. Perry, Garrett Y. Lansing and Edward R. Perry.

WE LEARN from one of the daily papers that J. A. Lansing of the Scranton Stove Works, Scranton, Pa., was enjoying himself at Niagara last week, in company with a party of friends. They were coasting down the side of the mountain below the falls when the coaster came in contact with a huge cake of ice, throwing Mr. Lansing off and badly bruising him. He was taken to the Prospect House, where his wounds received proper attention.

THE RICHMOND STOVE COMPANY of Norwich, Conn., resumed operations on Monday, January 30, after a brief shutdown.

IT IS WELL KNOWN that women in the New England States are more generally engaged in pursuits heretofore monopolized by men than in any other part of the country. Massachusetts particularly has an army of bright women scattered through its business world. It is not often, however, that one meets with women as manufacturers, but in Fall River there is a stove foundry in charge of a bright young woman, who has been drawn into her present responsibilities by circumstances rather than from inclination. The Eagle Stove Foundry at Fall River, Mass., was established some ten years ago by John Davis and conducted by him until his death in 1891. Then the management devolved upon his son, J. Holland Davis, who has for some time been incapacitated by illness. Since then the foundry and office have been presided over by his sister, Miss Davis, who is following the lines laid down by her father, and while attempting nothing radically new, is continuing the business very successfully. Trade, both in New England and the West, is reported satisfactory, and the outlook for 1893 is regarded as promising. C. L. Fisher, as traveling salesman, will visit the trade in New England this year.

THE SAUGATUCK FOUNDRY COMPANY of New York City have just been incorporated with the Secretary of State at Albany. The company are organized for the purpose of manufacturing and selling stoves, ranges, fire place goods and general iron castings. The capital stock is said to be $30,000. The directors include C. A. Filley of Lansingburg; Mark H. Filley of Saugatuck, Conn; and James D. Lincoln, C. L. Carpenter and Henry de Rivera of New York City.

SOUTHARD, ROBERTSON & COMPANY of Water street and Peck Slip, New York City, have issued an announcement to the trade to the effect that having purchased at a recent sale of the National Stove Company a number of patterns, they are now prepared to furnish repairs for the Live Oak and Mutual Friend cooks, the Saturn and Polo heating stoves and the Nelson hard coal furnace.

THE DEMAND for oil stoves promises to be enormous this year, judging by the way orders are being received by those engaged in that line of business. The past winter has developed an extensive use of oil-heating stoves and this year will probably see a still greater increase. Sam S. Utter made full preparations to meet the demand for the Game and Summer Girl stoves, and up to date the orders and deliveries are said to have been double those of last season, necessitating a still further increase of manufacturing facilities, which we learn are being pushed forward rapidly.

SOME OF THE MANUFACTURERS of steel ranges are showing very great enterprise in pushing the sale of their goods. Not long since, we are advised, fourteen teams arrived at a town in the Northwest, and after loading up with ranges at the freight depot, scattered throughout the surrounding territory, canvassing for trade from house to house. We are familiar with the fact that steel ranges have long been sold in this way, but were not aware that it was being done on such a comprehensive scale and in such a thorough manner. The results of this method of seeking customers must be satisfactory or it would not be followed up with so much vigor.

THE MICHIGAN STOVE COMPANY'S latest reminder to the trade takes the form of a cardboard puzzle, a four sided figure of irregular shape being given as a specimen. Four similar pieces are to be cut, and they are then to be formed into a perfect square—with patience and the requisite ingenuity. This puzzle is printed on a piece of fine paper, on the reverse side of which is a very pretty picture in colors of a child with wild flowers. A postal card circular from the same company refutes the charge that Garlands are higher in price than other goods of equal quality.

THE ENERGETIC ADVERTISER loses no opportunity to let the public know the merits of his goods. An illustration of this comes to hand in connection with a very neat card of invitation to a ball in Armory Hall, Sterling, Ill. The announcement is made on a leaf of the invitation card, doubtless as a stronger inducement to attend, that the building "is heated by the famous Peninsular furnaces, sold only by Meister & Rohrer" of Sterling.

The last fair of the American Institute yielded only a trifling margin of profit, less than for several years. The total value of the Institute property is $235,000, and it is proposed to spend $150,000 in improvements.

The exports from the United States to Argentina of agricultural implements for 1892 were valued at $1,910,747, against $527,585 the previous year. The grain harvest in that country, which began early in December, promised great abundance.

The report is revived, by way of Panama, that the Rothschilds and Baron Hirsch are at the head of a new canal syndicate and will each subscribe 25,000,000 francs, provided an extension of the canal concession can be obtained.

Consul Astwood at San Domingo reports that the reciprocity treaty with that country has not improved commercial relations, and that the people are much dissatisfied.

The Hardware Club of New York.

The accessions to the membership of the Hardware Club being sufficient to insure the success of the project, the officers are concluding negotiations for the rental for a term of years of premises in the Postal Telegraph building, corner Broadway and Murray street, and it is regarded as practically settled that the club will occupy them on the completion of the building. The number of members who have connected themselves with the club is regarded as sufficient to carry the club financially, while the fact that the largest and most representative houses are identified with it gives promise of its success and influence. It is a matter of special satisfaction that the club includes the leading houses in the trade located in New York and has among its non-resident membership many representatives of jobbing and manufacturing interests in other places. It is expected that there will be a large development of the non-resident membership, and that the club will be in a large measure representative of the Hardware and Metal interests of the country.

According to the provisions of the constitution of the club, the annual meeting will be held on the third Saturday of March, at which time 15 members will be elected, which shall constitute the board of governors.

A committee consisting of

DAVID WILLIAMS,
H. C. MARSHALL,
V. P. HUMASON,
JOHN H. GRAHAM,
U. T. HUNGERFORD,

was elected at a meeting last week to make such nominations in accordance with the provisions of the Constitution, article 4, section 2.

SEC. 2.—A committee to nominate governors for election at the annual meeting shall be chosen by ballot by the Board of Governors at a regular meeting a month preceding the annual meeting. Such committee shall consist of five members, not governors, and they shall nominate in writing members who have consented to serve as governors to be elected at the annual meeting, and at least ten days before the annual meeting shall place the names of such nominees on the bulletin board, and shall report the nominations in writing to the Board of Governors. But any other five members, not governors, may nominate members who have consented to serve as governors to be elected at the annual meeting, and may put such nominations over their signatures on the bulletin board of the club at least five days before the date of the meeting.

It will be remembered that at a former meeting of the club the office of the secretary, J. L. Varick, 105 Chambers street, was designated as the official headquarters of the club, where the nominations above referred to are to be officially posted.

THE DINNER.

On account of the financial embarrassment of the Manhattan Athletic Club, it has been found necessary to change the place of the Hardware dinner, which will be held at Sherry's, Fifth avenue and Thirty-seventh street, on Tuesday evening, February 21, at 7 o'clock, instead of in the rooms of the Manhattan Athletic Club, as originally intended. The dinner committee suggest that if any further tickets are desired application may be made at once, as but few remain. It is the intention of the committee not to sell more seats than the room will comfortably accomodate, so as to avoid overcrowding of tables. Arrangements for the dinner are progressing satisfactorily, and it is expected that it will be an exceptionally pleasant occasion.

Governor Murphy of Arizona claims a population of between 70,000 and 80,000 for that territory.

PRIZE COMPETITIONS.

WE HEREBY ANNOUNCE a series of six prize competitions relating to trade matters in which our readers are interested. Four prizes of $50, $25, $15 and $10 will be awarded in each competition.

The competitions are open to all and a general participation on the part of the trade is invited.

We shall have the privilege of publishing any or all of the contributions received.

The committee of award in assigning prizes will take into account the merit of the different contributions and their suitability for publication.

PRIZE COMPETITION No. 6.

How Retailers Can Best Advertise and Extend Their Business.

The object of this competition is to obtain practical suggestions as to the methods which the retail dealer in Hardware, Stoves, Tinware, &c., can advantageously adopt in building up his business, and is intended to cover such points as the following:

Advertising in the local papers, with suggestions as to how such advertising should be done and to what extent;
The manner in which circulars and other printed matter may be used;
A description of any special or unusual methods of attracting and holding trade; and
General suggestions in regard to ways in which the business can be extended.

An account of any methods which have been found useful in building up trade will be suitable under this competition.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 6.

PRIZE COMPETITION No. 7.

Travelers' Yarns.

The traveling salesman is proverbially happy in the stories which he narrates, and this competition is for the purpose of calling out a collection of good yarns for publication. While the attention of travelers is specially invited to this competition, it is open to all. Stories relating more or less closely to trade or business matters will be preferred.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams 96–102 Reade street, New York, and marked Prize Competition No. 7.

PRIZE COMPETITION No. 8.

How to Treat Clerks.

Under this competition, beside a general discussion of the subject, such questions as the following may be considered:

The extent to which clerks should be given an opportunity of obtaining a knowledge of the business, and of price-lists, prices, &c.;
Whether it is desirable to have formal rules for the regulation of employees and for the management of the store. If so, a set of rules should be submitted;
To what extent clerks should be held responsible for their mistakes;
Suggestions as to how clerks should be treated in order to secure their most intelligent and efficient work;
Mistakes made in the treatment of clerks.

This competition opens an important subject and it is hoped that it will be discussed fully by merchants and by their clerks from their different points of view.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 8.

PRIZE COMPETITION No. 9.

Shop System of Keeping Track of Jobs.

This competition is intended to call out information in regard to methods of keeping account of the cost of labor and material on tin-shop work, repairing and new work, inside and outside. In connection with the general subject such points as the following may be touched upon:

Whether blanks or forms are used in connection with such work. (If so, samples should be submitted);
What record is kept of orders, costs of jobs, charges, &c.;
How time occupied in going to and from the job is covered;
Suggestions in regard to the profitable conduct of the shop.

To illustrate the system it is desirable that a specific job (as for example, repairing down spouting and eave trough, or other job of repairing in which new material is used) be referred to and the method of keeping track of the costs in such job fully explained.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 9.

PRIZE COMPETITION No. 10.

Business Maxims—At Least 10.

Those entering this competition will send at least ten maxims relating to the conduct of business, presenting in a brief and pithy manner practical suggestions which may advantageously be followed.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business February 18, 1893.

Contributions should be addressed to David Williams 96–102 Reade street, New York, and marked Prize Competition No. 10.

PRIZE COMPETITION No. 11.

How Small Retailers May Keep a Record of Prices.

The object of this competition is to call out information or suggestions in regard to the best methods to be adopted in keeping a record of prices, showing cost or selling prices, or both cost and selling prices, of Hardware, Stoves, Tinware, &c., in a small retail store employing not more than four persons in the selling and bookkeeping departments, including the proprietors. Those entering the competition are expected to give a concise and clear explanation of their system, and if a price book is used, to submit as illustrating the system at least three specimen pages. If a price book is referred to it may be of any design or arrangement best adapted to the purpose, and may be original with the contributor or may be one of the different price books on the market. Fictitious names should be used instead of the real names of jobbers and manufacturers.

The committee in awarding prizes will take into account the merit of the different systems described, the character of the descriptions given, and the general utility and interest of the contribution.

First Prize	$50.00
Second Prize	25.00
Third Prize	15.00
Fourth Prize	10.00

This competition will be open until the close of business, February 18, 1893.

Contributions should be addressed to David Williams, 96–102 Reade street, New York, and marked Prize Competition No. 11.

Egg Holder and Egg Tongs.

George E. Fahnestock & Co., Lancaster, Pa., are putting these goods on the market as shown in Figs. 1 and 2. The holder, Fig. 1, contains the egg at the

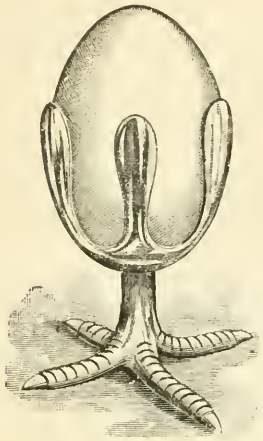

Fig. 1.—Egg Holder.

table, and allows of the upper portion of the shell being removed when preparing it for eating. The tongs are used for taking the egg from the dish and holding it while it is being prepared. The advantages claimed by the makers for these devices are that they obviate burnt fingers, soiled table cloths and napkins. The

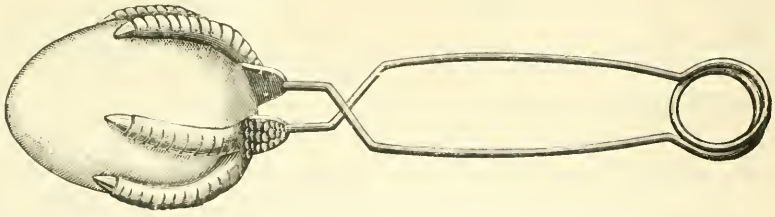

Fig. 2.—Egg Tongs.

goods are nicely finished and attractive in appearance.

Glass-Tube Cutter.

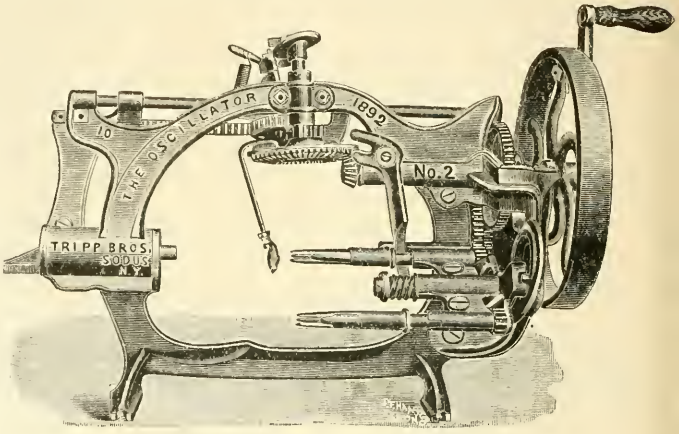
H. A. Rogers, 19 John Street, New York, is introducing the Favorite glass-tube cutter, as here shown, which is an improvement on a similar article brought out some months ago. The tool is 7¾ inches long and $\frac{3}{16}$ inch in diameter. At the end is a small beveled revolving steel wheel on one side of the instrument, and a circular movable gauge with thumb screw. The gauge may be set as far as 5½ inches from the cutting end. In operation, the glass tube is placed on a board or table, the rod inserted and the wheel brought in contact with the glass. By bearing down lightly on the cutter, and at the same time

The Rogers Favorite Glass-Tube Cutter.

imparting a rotary motion to the tube with the palm of the other hand, the cutter wheel will mark a circle on the inner surface of the tube, when a gentle tap will cause it to part with a clean, smooth fracture.

The Oscillator No. 2.

The accompanying cut represents a power apple parer and corer, put on the



The Oscillator No. 2.

market by Tripp Bros., Sodus, N. Y. The wheel to which the crank is attached is also adapted for the use of a belt, and by the addition of a friction clutch and lever it is made ready for power use. The forks are operated and held in position by a simple yet ingenious plan, and paring as they do two apples at the same time, make the machine almost equal in capacity, it it is stated, to two one fork machines. The capacity of the machine is from 30 to 38 apples per minute. Three turns of the wheel are required to pare and core an apple. The point is made that the skins, cores and fruit are all separated, and that on reasonably fair fruit the machine will remove every particle of peeling and core. The machine has bearings lined with brass, the mechanism for operating the parts is simple and the entire construction of the machine is such as to secure strength and durability. It is particularly designed to prepare apples for evaporating. The above firm continue to manufacture the No. 1 Oscillator, which is a one fork parer and corer, in which the same mechanical principles are embodied as in the No. 2.

Six Screen Door Frames.

The W. J. Kelley Company, Greenville, Ohio, and 345 Rookery, Chicago, are crating the Kelley adjustable screen door frames for shipping, as shown in the accompanying illustration. This forms a neat and compact package for handling

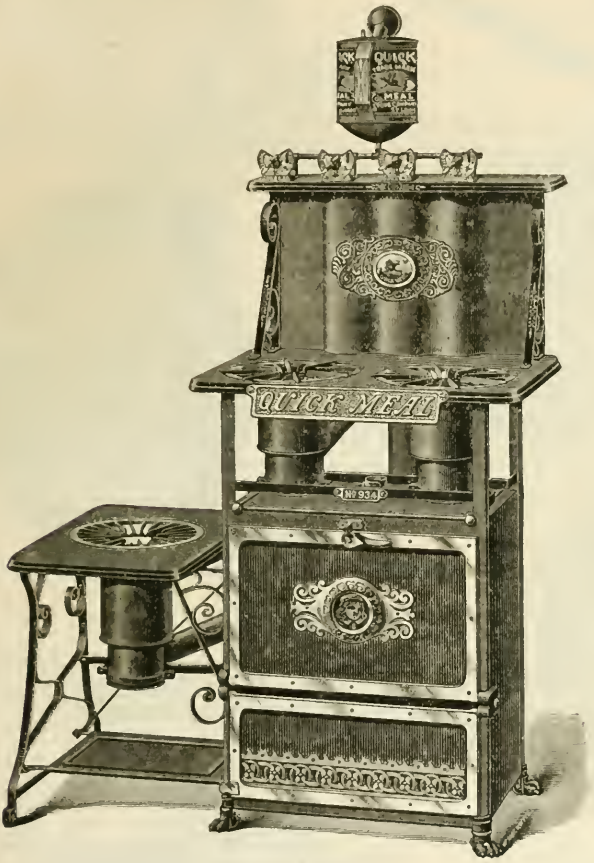
Six Screen Door Frames.

and storing, and preserves the frames from injury until wanted. The frames are made in four sizes, from which it is stated any sized screen door ever called for can be made.

Touching the silver question, a prominent banker has prepared a list of United States railroad bonds exceeding three thousand millions of dollars, the principal and interest of which are payable in gold. As given in Poor's Manual, the total bonded debt of our railroads last year was $5,235,295,000.

The Quick Meal Evaporating Stove.

The evaporating style of gasoline stove which we illustrate in the accompanying engraving is known as the Quick Meal No. 934 and is being offered the trade

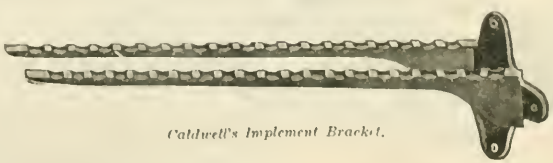


Quick Meal Evaporating Stove.

by the R'ngen Stove Company of 414 North Broadway, St. Louis, Mo. The stove is of neat finish and attractive appearance, the effects being enhanced by the use of a nickel shield and name plate. Below the tank are dials which show whether the burners are opened or closed. The tank is so constructed we are informed that it cannot be filled unless removed from the stove. The arrangement of parts is such that the dripping of the gasoline from the tank to the burners when the valves are opened can be readily seen. The oven flame is lighted by lifting the hinged cover. The manufacturers state that all the flames are blue, the one under the oven being especially powerful. In the construction of these goods the company state that for the season of 1893 the perforated brass for the evaporator is two gauges heavier than heretofore employed. They have also added to the value of these goods by adopting an automatic lock for the benefit of those who are yet unacquainted with the operation of evaporating stoves. It is stated that without this lock the tank might be put on the stove with the drip valves several turns open, and in trying to close them the pointer would strike the top pin on the dial, the valves continue the dripping and the operator be in a quandary how to stop them. As now made the pin on the lock allows the pointer to pass close to the valve, but will not permit the valve to be reopened further than required. This improvement is said also to be useful in case the drip valve is partially clogged. In that case the stop pin can be lifted and the valve opened as far as desired, when the obstructions may be washed out without removing the tank from the stove. The top surface of the Quick Meal No. 934 here shown measures 22 x 27 inches; the oven is 14 x 19 x 12 inches and the hight of the body of the stove 36 inches. The top of the step is 21½ inches from the floor and measures 15 x 23 inches.

Caldwell's Implement Bracket.

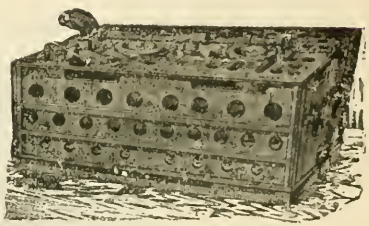
The accompanying illustration is of an implement bracket manufactured by the Heckel Hardware Company, St. Louis, Mo. The bracket consists of a base and two parallel arms, the upper side of the arms being provided with notches. The base plate is fastened to the wall or rack by screws. The projecting arms are of sufficient length to hold half a dozen or more rakes, hay forks, manure forks, hoes, &c., or any other tools of this character. This bracket has advantages over harness hooks or other devices not strictly intended for the purpose of hanging and displaying tools and implements.



Caldwell's Implement Bracket.

The Standard Gas Generator.

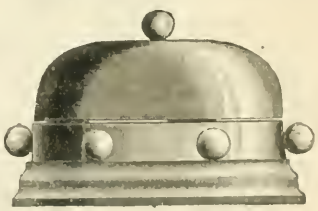
In the illustration presented herewith is shown the Standard gas generator, a device for converting kerosene oil into gas. It can be placed in any stove or heating apparatus, and is claimed to produce a gas that burns like natural gas, without smoke or odor. In cooking stoves the consumption of oil is said to be 1 gallon in five hours for a fire that will do all that coal is capable of doing. Refined petroleum costing 6 cents per gallon is used with this device. The generator is placed upon the grate of the stove, the only alteration necessary being the drilling of a hole for ¼-inch supply pipe to enter the stove from the side. The apparatus includes one 10-gallon can, 10 feet of pipe and fittings, more than 200 of them, we understand, being now in use. The makers of the device are the American Oilgas Company, George H. Gregory, secretary, care of Cyrus Carpenter & Co., 44 Hanover street, Boston, Mass.



The Standard Gas Generator.

Revolving Table Bell.

Hardware Specialty Company, 61 and 63 Mulberry street, Newark, N. J., have recently put on the market the bell illustrated herewith. They call attention to the simplicity of its construction, inasmuch as it has no springs or delicate parts and requires no winding. It is finished in nickel plate or quadruple silver plate, as desired, and is furnished in two sizes, 3 and 4 inch.



Revolving Table Bell.

Deposits in Massachusetts savings banks last year increased $9,130,000.

The Coldwell Lawn Mowers.

The Coldwell Lawn Mower Co., Newburg, N. Y., have made several improvements in lawn mowers during the past season. The Imperial mower, Fig. 1, is made in 8 and 10 inch wheels and of the general sizes in width of cut. Two ordinarily weak points, the manufacturers claim, have been made the strongest ones, namely, the ratchet and the adjustment of the knives. The ratchet used in the Imperial is a triple one, Fig. 2, such as is used in horse lawn mowers and heavy roller mowers. It is claimed that the ratchets have been known to wear over 15 years, and in all this time, while many thousands of them have been in use, there is no record of one either breaking or wearing out, which, it is remarked, is an exceptional record. Other features of the ratchet is the almost entire absence of noise, and also that the lost motion practically amounts to nothing. Instead of moving the knife bar to adjust the knives in the Imperial, the knives are adjusted to each other by moving the revolving cutter. The knife bar and side frames are bolted rigidly and permanently together, these with the front rod forming a strong immovable frame. The adjusting is done by means of an ingenious revolving cutter hanger which swings directly in the center of the driving gear and is securely bolted to the side frame by two bolts. The revolving cutter is moved to or from the bed knife by means of two set screws in the end of the hanger, by which the most delicate adjustment of the knives can be made. When the hanger is securely locked between these two set screws it is stated that there is no possibility of the adjustment jarring out of place by being knocked about in boxing and transportation, and that dealers will have no trouble readjusting their mowers when taken out of the cases. The hanger is also arranged so that all the wear can be instantly taken up by turning one screw. This adjustment is referred to as being simple and secure.

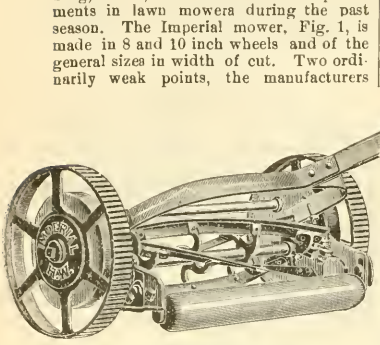


Fig. 1.—High Wheel Imperial Mower.

The arrangement of the driving wheels and gears is also spoken of as a new feature. The drive wheels are independent of the gears and connected to the large gear by the triple ratchet. By this means the ordinary small ratchet and loose pinion on the revolving cutter shaft is done away with, and when the machine is reversed the gears are stationary, thus avoiding a great amount of wear on them, and doing away with the usual clatter and noise when running backward. Another advantage of this arrangement of the gears is that in sharpening the mower a nail or piece of wire can be inserted in a hole in the large gear, and the knives can be reversed without taking off the driving wheels or pinions on reversing the ratchets.

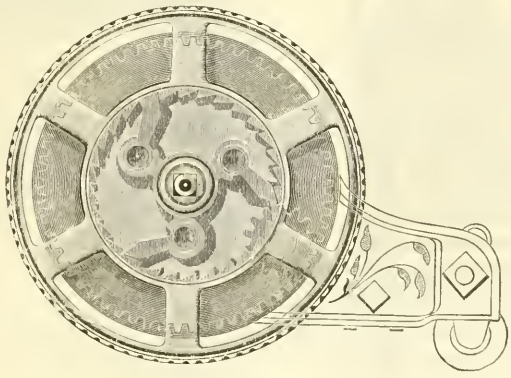

Fig. 2.—Triple Ratchet.

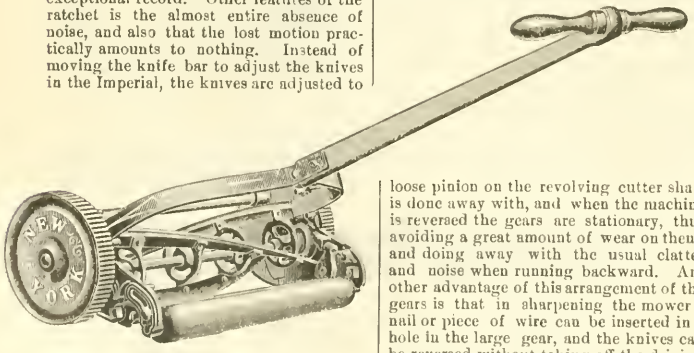

Fig. 3.—New York Mower.

The Imperial has on it also a terrace cutting arrangement for cutting terraces equally as well as level lawns.

The New York mower, Fig. 3, is designed to meet the demand for a good substantial machine at a medium low price. It has several of their latest improvements in ratchet, back roller hanger, handle adjustment, &c. It is made in medium sizes, 12, 14 and 16 inches, with 7-inch driving wheels. It is adapted for small city plats, especially when the children or a lady does the cutting. It is referred to as light running and as doing excellent work.

Auger Mortise Pulleys.

Shepard Hardware Company, Buffalo, N. Y., are offering the trade sash pulleys as shown in Figs. 1 and 2. They are made with wheels drilled and polished, steel axles and marking points on the sides. These fit the same mortise as the Empire and Common Sense pulleys. The pulleys shown in the cuts are made in 1¾ and 2 inch.

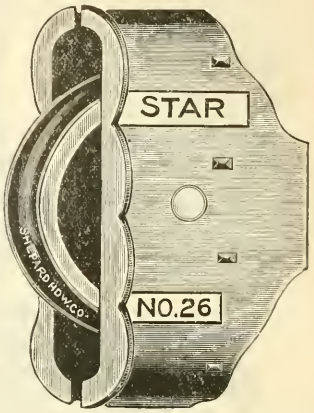

Fig. 1.—Star Mortise Pulley.

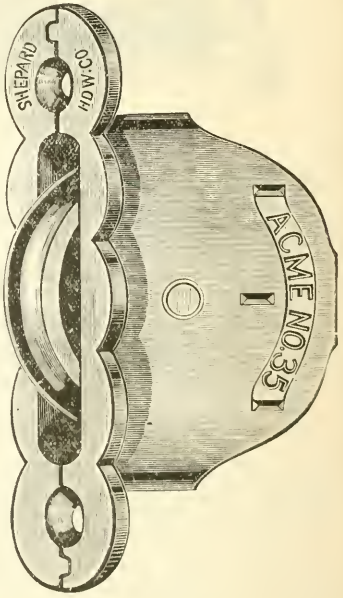

Fig. 2.—Acme Mortise Pulley.

The Perfect Lawn Rake.

F. E. Kohler & Co., Canton, Ohio, now have ready for market the line of rakes herewith shown. The rakes are made with a hard wood head, in which, it is stated, only the very best pieces are used and will never wear out, and the handles of turned white ash, perfectly dry. The teeth are made of the finest and stiffest spring steel wire and are driven diagonally through the head, and lie almost flat on the ground when in raking position. It is remarked that the rake cannot catch or dig into the ground; that it will take up all dirt or dead leaves, instead of only the stuff lying loosely on the top of the grass, and that on account of its peculiar construction it need only be pushed backward without raising or lowering the handle to clean itself perfectly. The hood is made of No. 22 sheet steel, and is designed for gathering a large load. The socket in which the handle is attached is of the best malleable iron, bolted to the head with two stove bolts, making it possible to leave the sockets off for shipping, thus making a compact crate. The point is made that there is nothing about the rake to break or wear out, and that it is light. The rakes are made in two sizes, 18 and 22 inches, with and without hoods.

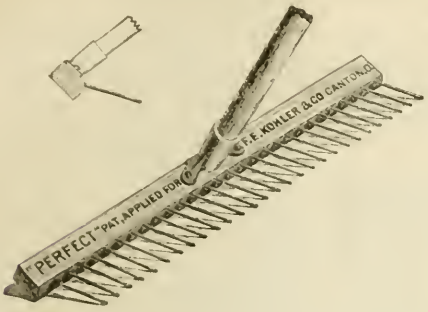

Fig. 1.—The Perfect Lawn Rake.

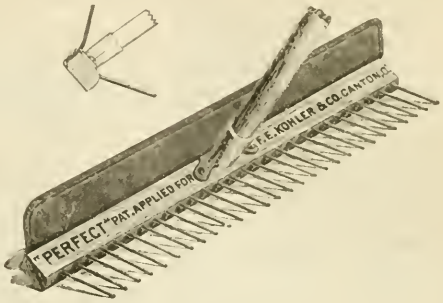

Fig. 2.—Perfect Lawn Rake with Hood.

Cutting off the supply of labor by restricting immigration is liable to embarrass Western farmers, both in planting and gathering their crops. Last autumn heavy losses of grain were reported from the impossibility of obtaining men to do the work. One effect is likely to be a more urgent demand for agricultural machinery.

Household Folding Wash Bench.

The American Wringer Company, 99 Chambers street, New York, are introducing the Household folding wash bench, as illustrated in Figs. 1 and 2. The bench open, Fig. 1, will hold two tubs and a clothes wringer at one time. Any wringer may be placed on the standard and clothes may be wrung from either tub into the other. The board or trough at the top is so arranged that it may be tilted in either direction instantly. By using this bench the tubs are relieved of the strain incidental to wringing and also the injury wrought by the screws in fastening the wringer on the tub. The tubs are free to be emptied at any time, and there is no time lost changing the wringer from one tub to the other. Fig. 2 shows the bench folded in compact form, to be put away until required. Attention is called to the standards, which permit of its standing upright instead of leaning against something else. The bench is constructed entirely of hard wood.

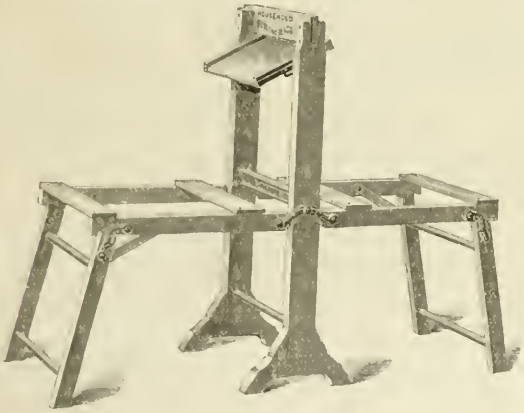

Fig. 1.—Wash Bench Open.

Fig. 2.—Wash Bench Folded.

Duplex Rat Trap.

The F. J. Meyers Mfg. Company, Covington, Ky., Eastern agent, F. J. Mattison, 69 Beekman street, New York, are introducing the Duplex rat trap, as here shown. It is made of No. 16 iron wire and japanned. The interior space is divided horizontally by a wire floor 4 inches from the bottom. There are two entrances and two trap doors. The bait is placed in the center of the trap in the upper section, and two partitions are so arranged that they may then be raised to an acute angle and fastened by a link on the outside. This permits the rat to see the bait but prevents him from touching it. On approaching the bait he steps on a cast-iron trap door weighted at the back, which precipitates him into the compartment below and at once automatically resumes its normal position ready for the next one. The bait may be seen from all points either in or out of the trap, but cannot be touched. The trap is made in two sizes, 30 x 11 inches and 24 x 9 inches.

The Duplex Rat Trap.

Trade Notes.

THE JOHN A. BROWN NOVELTY COMPANY were recently incorporated at Decatur, Ill., the incorporators being John A. Brown, J. L. Thayer, L. S. Bonbrake and H. C. Harmon of Decatur. The capital stock is $18,000, and it is the intention of the company to manufacture a line of Hardware specialties, the inventions of L. S. Bonbrake. Work will be begun at once upon a two-story building 25 x 80 feet, to be erected near the Wabash tracks, and the building will be fitted with a large press and dies and special machinery for manufacturing the goods. The articles to be turned out will include various novelties in the Hardware line; 3 and 5 gallon Oil Cans in two styles; the Simplicity Oil Can, which is operated on the compressed air and syphonic principles; the Decatur Rotary Can, which automatically atops the flow when the lamp is filled, being three of the specialties to be made. The firm will also manufacture Convertible Step Ladders, Animal Traps, Neated Stove Pipe, the Fire Witch Stove Back Wall, a plastic material which hardens when in contact with a fire; Stove Polish, &c., altogether some 20 specialties.

ONE OF THE most tasteful catalogues of the season comes to us from the Tuttle & Bailey Mfg. Co., New York and Boston. It consists of a 42 page book, illustrating and describing the company's Warm-Air Registers, Ventilators, Screens, Borders, &c. A cream colored cover bears in relief a medallion portrait of Columbus, with the name of the company, &c., surrounded by a handsome scroll-work design. Paper and printing are alike good, and the illustrations clear. The catalogue contains a number of new designs in Registers and Ventilators, including the Brilliant, Florentine, Plain Lattice, Indian Lattice, Japanese, Renaissance and Moresque patterns, together with tables of sizes and prices. The Registers are furnished in black or white japan, bronze, brass, enameled white porcelain, rustless iron, nickel plate, or silver plate; and the Ventilators comprise every form of ornamentation combined with efficiency, giving a good idea of the artistic capabilities possessed by these devices. A feature of the catalogue which is effective is the insertion of black leaves upon which designs of Registers are printed in their natural colors, silver and bronze.

DEAN MFG. COMPANY, Taunton, Mass., manufacturers of Tinware, advise us that they have recently added a number of new goods to their line, including Blue and White Ware, which they are offering at low prices. Their factory was open every working day last year and the outlook for 1893 is reported as favorable. A constantly increasing demand for their heavy, hand-made Tinware is noted, also an increase of 20 per cent. in January business over that of last year.

THE SMITH & ANTHONY STOVE COMPANY, Boston, Mass., have received some very strong testimonials on their Hub Steam Heater, and they claim for it remarkable rapidity in getting up steam, which implies a consequent saving in fuel In an announcement elsewhere two illustrations are presented of the Hub Steam Heater and attention is drawn to its merits. The same firm also make the Hub Hot-Water Heater.

THE ATLAS TACK CORPORATION in this city, finding their quarters at 116 Chambers street inadequate, have leased and are now occupying a portion of the building 31 Warren street, running through to 31 Murray street. They have the street floor and two basements, each being 175 x 26 feet. The office and salesroom will be on the Warren street end, the receiving and shipping of goods being done at the Murray street entrance. Their largely increased capacity will enable them to carry a much greater assortment and stock.

ROME MFG COMPANY, 135 and 137 South James street, Rome, N. Y., in their advertisement in this issue call attention to their Seamless Copper Tea Kettles, which are made from 14-ounce and 18-ounce copper, polished and nickel-plated.

TAEGE BROTHERS, Arlington Hights, Cook County, Ill., direct attention elsewhere in this issue to the Dubuque Pattern Style Milk Can. They also refer to their general assortment of Tinware in the line of creamery supplies, of which goods they make a specialty of manufacturing all styles and shapes.

FRED. F. BISCHOFF & Co., 24 West Lake street, Chicago, direct attention to the Bischoff Sheet Steel Enameled Bath-tub, and note briefly points of merit. An illustration of the tub is shown in an advertisement elsewhere.

THE DIXON CRUCIBLE COMPANY of Jersey City, N. J., send us a copy of an exceedingly neat little catalogue just issued from the press, which relates to Dixon's American Graphite Pencils, and is printed in black upon a good quality of paper. It is bound in paper covers, the front being embossed in gilt letters, and carrying a *fac-simile* of a No. 2 Lead Pencil. The illustrations are numerous, showing the leading lines of goods with which the company are prepared to supply the trade, and also giving a view of their graphite mines at Ticonderoga, N. Y., as well as of their works and general office in Jersey City. We understand that this catalogue is not intended for general distribution, but that the company will be glad to send a copy to all dealers in stationery.

THE HARTMAN MFG COMPANY of Beaver Falls, Pa., have made a change in their Chicago office, at 508 State street. F. S Atherton, who has been in the employ of the company as selling agent for nearly five years, has been promoted to the position of general Western sales agent in place of T. Dewitt Ganse, who has held this position for two years past. Mr. Ganse has removed to Marshall, Mich., where he owns a stock farm, and is at present devoting his time to the interests of same. Mr. Atherton will have entire charge of the territory west of Chicago to the Pacific Coast, and also the Southern States west of Louisiana and including that State. He has also made arrangements with the Union Drawn Steel Company of Beaver Falls, Pa, to represent them in this same territory as general Western sales agent.

NOTWITHSTANDING this being the dull season of the year, it is reported that the works of James B. Scott & Co., Pittsburgh, Pa, are running to full capacity and putting out a large volume of Terne Plates. The sale of the company's special brand, Scott's Extra-Coated Roofing Plates, is said to be very satisfactory, and a greatly increased demand for these Plates is looked for during the present year. The firm are prepared to increase their factory output in proportion to the growth of demand for their productions.

THE ESTABLISHMENT of an Anti-Rust Tinware factory at Honeoye Falls, N. Y., is almost assured. The capital stock will be $10,000, and $5500 has been taken The enterprise, when run at its full capacity, will employ 20 men and pay about $9000 a year in salaries.

A CIRCULAR over the signatures of F. B. Devendorf and S. E. Hunting informs the public that the copartnership heretofore existing under the firm name of Devendorf & Hunting, manufacturers of and dealers in Tin, Copper and Sheet-Iron Ware, Iron Pipes, Pumps, &c., at Watertown, N. Y., has been dissolved by mutual consent. The concern has been reorganized under the firm name of Hunting & Weekes, and will carry on the same line of business, making a specialty of Pipe Fittings and Plumbing Goods.

THE W. DEWEES WOOD COMPANY of the McKeesport Iron Works, at McKeesport, Pa., and sole manufacturers in this country of Patent Planished Sheet Iron, have recently purchased considerable ground adjacent to their works, which will probably be utilized for extending the plant.

RANDOLPH & CLOWES of Waterbury, Conn., recently shipped a lot of Seamless Drawn Copper Tubes, 38 feet long, 3-16 inch thick, 2 inches inside diameter, and weighing 152 pounds each.

S. OBERMAYER COMPANY, Cincinnati, Ohio, Foundry Facing and Supply manufacturers, report the volume of business as being excellent with them. Among late orders and inquiries received is one from Manchester, England, and one from one of the islands in the Indian Ocean. The company contemplate establishing a branch in a prominent city East of Cincinnati at an early date.

THE HITCHCOCK LAMP COMPANY of Watertown, N. Y., have elected the following officers: President, J. B. Taylor; vice president and treasurer, Robert Hitchcock; secretary, George B. Massey; directors, J. B. Taylor, George B. Massey, J. W. Moak, Mrs. J. W. Moak and Robert Hitchcock.

W. A. ROYCE of Newburg, N. Y., is placing on the market a patent agate enameled Drive Well Point. The gauze strainer and perforated plate are held away from the enameled surface of the perforated pipe by a spiral coil of wire wound around the pipe. A circular states that a 1¼-inch pipe, 24 inches long (exclusive of the cone to pierce the earth) yields 5½ gallons of water per minute to a steam driven pump, equal to 8000 gallons every 24 hours.

MATTHAI, INGRAM & Co., recently at 64 Reade street, New York, have moved to new and more commodious quarters at 42 Cliff street, where they will be more in the trade center with which they are connected. They have secured three lofts, the first of which will be used as an office and sample room. The second and third lofts will be devoted to the storing of stock. The increased room will allow of carrying a larger and much better assortment of the line made by this house at their factory in Baltimore, which will be availed of. The branch in this city still continues under the management of Edward H. Brooks.

DUFFY & LOVELOCK TOOL COMPANY, 154 Lake street, Chicago, has been formed for the purpose of making a line of fine Steel Tools, consisting of Crate Openers, Blacksmiths', Tinners', Bricklayers' and Carpenters' Tools, including a line of very fine quality of Carpenters' and Blacksmiths' Pincers; also a full line of Concrete Tools for use in making concrete sidewalks. It is their intention to add to their line from time to time as business may demand. The principal stockholders of the company are Arthur Brittan, A. W. Bond and George M. Lovelock, three old Hardware traveling men well known to the buyers in the country. The quality of the goods they are making should insure them a large and successful business.

THE W. DEWEES WOOD COMPANY, proprietors of the McKeesport Iron Works, at McKeesport, Pa, have recently put in operation a system by which prizes are given to the workmen on the hammet turning out the largest amount and best quality of iron in six months. Recently a cash prize of $1500 was thus divided.

TRADE REPORT.

The Iron Market.

There is somewhat of a more hopeful feeling throughout the Pig Iron market, as indicated by the business of the past week; and while prices have shown an advance in but few cases, the hope is entertained that the downward tendency has been arrested, and that the prospects are favorable for a turn in the condition of the market. Orders for Iron and Steel have been placed quite liberally during the past week, which has had a tendency to stiffen the market generally. The hand-to-mouth buying policy has been pursued for so long that buyers have been left with practically no Iron on hand, and when the market showed symptoms of a slight advance, hurried efforts were made to cover future requirements. As to the immediate future of the market, little or nothing can be said with certainty. Some makers state that the conditions surrounding the market are extremely favorable, and that the advance will not only be sustained, but that even better prices will prevail before long. On the other hand, buyers claim that the spurt in price is only of that kind which comes periodically, and in view of the large productive capacity now idle, but which can be blown in on short notice, the advance cannot be maintained for any considerable length of time. The unsettled condition of the market makes reports hard to understand. Some claim to meet with a good demand at full prices, others say that business has been taken from them at prices and on terms which show a most unusual condition of affairs. But as regards regular standard brands, business is done at the old figures, and when there is any serious shading it is either for new brands, forced sales or off-grade Iron, although unfortunately there has been a good deal of that kind of business within the past two or three weeks. As a rule furnaces appear to be pretty well sold up, but there has evidently been some unloading somewhere —either from first or second hands. It may be all the better for the market in the long run. In former times a cleaning up of odds and ends was generally the signal for a movement along the entire line, and while no one seems to look for any very decided improvement now, it is just possible that the outcome may be in the nature of another surprise. Buying in the territory tributary to the New York market continues from hand to mouth, buyers showing no disposition to contract for delivery far ahead. The market continues in buyers' favor. We quote Northern brands at $14.75 @ $15.25 for No. 1; $14 @ $14.50 for No. 2, tidewater. Southern Iron, same delivery, $14 75 @ $15 for No. 1; $13 75 @ $14 for No. 2 and No. 1 Soft; $13.25 @ $13.50 for No. 2 Soft.

In the Philadelphia market there has been a considerable amount of Pig Iron changing hands; standard brands at quoted rates, others at such figures as circumstances would permit. There is nothing, however, to indicate any great confidence among either buyers or sellers, what strength there is being due to the fact that prices are little, if anything, beyond first cost, and solvent concerns are determined to either maintain prices or stop production. General quotations for Philadelphia and near by deliveries are about as follows:

American Scotch, No. 1X.....	$17.00	@ $17 25
American Scotch, No. 2X.....	16.00	@ 16 25

Ten days ago Bessemer Pig was quoted freely in the Pittsburgh market at $13.25 and in some instances even this remarkably low price was shaded, reports going that one lot changed hands on a basis of $13.02, Pittsburgh. These low prices brought a number of buyers into the market, and persistent attempts were made to force the price down to $13, Pittsburgh, but in only one case with success. Furnacemen who had refused to accept 25¢ less for their Iron commenced to look about, and after thoroughly sizing up the situation, announced the withdrawal of all offers below $13.25. When buyers discovered the independent attitude of furnacemen, and further saw that the next move would be in the nature of an advance, buying commenced pretty freely, and in less than 48 hours the market scored a clean advance of not less than 25¢ ₱ ton, sales having been made during the latter part of last week at $13.40 @ $13.50, Pittsburgh. The fact that one of the largest Pig Iron making concerns in this district has retired as a seller and appeared as a buyer has had considerable to do with the sudden turn taken by the market. Nos. 1 and 2 Foundry are only in moderate demand, and quotations have been slightly reduced. We quote as follows:

No. 1 Foundry.....	$13.75 @ $14.00,	cash.
No. 2 Foundry.....	12.75 @ 13.00,	"
Charcoal Foundry No. 1....	19.00 @ 20.00,	"
Charcoal Foundry No. 2 ..	18.50 @ 19.00,	"

Heavy consumers in the vicinity of Chicago seem at last to have made up their minds that Iron is cheap, and therefore have decided to anticipate their requirements for the year if able to buy at existing prices. The transactions of the past week are the largest that have taken place so far this year. Prices are now down to the lowest point ever noted in this market, and are perhaps lower than in any other Northern market for the same grades of Iron. The active condition of trade and the ease with which sales have been made recently, together with the very heavy consumption of Iron, cause manufacturers to feel that they have now seen the depth of the depression and a reaction is looked for, which may not come this month, but is expected about the time spring opens, if not before. The smaller foundries out of town are constantly in trouble, as they have recently purchased only from hand to mouth and the railroads are not delivering promptly, so that they find themselves frequently out of Iron. Complaints on this score are becoming more numerous every day. This is expected to lead to larger orders from this class of consumers to guard against occurrences of that kind. Quotations are as follows, cash, f.o. b. Chicago:

Local Coke Foundry, No. 1.....	13.25 @	13.75
Local Coke Foundry, No. 2.....	12.75 @	13.25
Local Coke Foundry, No. 3.....	12.50 @	12.75
Local Scotch...	14.00 @	14.50

During the week under review the Southern market has been extremely weak and prices are lower in consequence. Sales were not large, but on the whole fairly satisfactory. Consumers are taking advantage of the present condition of the market, and are buying in limited quantities, and each purchase helps to drive prices lower. A few furnaces are holding their prices, but as a consequence are not doing any business. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry,	$14 00 @	$14.50
Southern Coke, No. 2 Foundry,	12.75 @	13.00
Southern Coke, No. 3 Foundry,	12.25 @	12.50

Billets and Rods.—The principal event of the week has been the sale of 5000 tons of Foreign Billets to an Eastern Pennsylvania Wire mill, for re-export trade, at private terms. It is understood that there was very sharp competition among importers for the parcels of 3000 tons and 2000 tons into which the order was divided.

Steel Rails.—One Eastern mill is reported to have taken some good orders, aggregating about 20,000 tons, including 4000 tons for export to Cuba. The other works have not booked anything of consequence during the week.

Manufactured Iron and Steel.—The Plate orders for Gas Tanks referred to recently prove to have been larger than was then reported, involving as they did about 2000 tons. The Lincoln Safe Deposit building has been taken, the Beams and Structural Material for it, including about 650 tons of Beams, going to a Pittsburgh mill. The contract for the Astor residence has also been awarded. The Manhattan Life building, the largest now on the market, will be given out this week.

As yet there has been no stiffening in any of the lines.

Metal Market.

Copper.—The position of the market remains practically the same as it was a week ago. At all events, orders do not appear to have become more numerous, nor is there evidence of greater pressure to sell on the part of producers or outside holders. The fact that several thousand tons of French Syndicate Copper were unearthed in Europe not long ago is not lost sight of, nor is the probability that more may be discovered in America overlooked. In point of fact there is reason for more than a vague suspicion that the intended effect of the regulation of output and the curtailment thus far is discounted in a great measure by cautious buyers. While one side of the market may thus be somewhat uncertain, a counteracting influence exists in the fact that manufacturers of the general line of Copper and Brass on this side of the Atlantic are well employed and that prospects are favorable for increased consumption of Copper in various lines as the spring season advances.

Pig Tin.—Uncertainty as to what may be done in the way of legislation at Washington on the matter of duty on foreign Pig Tin seems to stand in the way of speculative movement, and the plain fact that leading operators have a considerable burden to take care of is also a drawback to outside venture as well as to trade purchases not dictated by imperative wants. That the latter are fully up to or above the average for the season is generally admitted, but statistics go to show that the stock on spot and afloat is unusually heavy and warrant the deduction that outside of the McKinley tariff there is nothing to prevent the natural outcome of present heavy visible supply. Harney Peak mine news suggests a tendency on the part of the managers of the enterprise to hold aloof for all the advantages that may be gained by keeping out of the market until something definite is learned as to the fate of the McKinley tariff, and thus add to the complications surrounding the market. Despite the several uncertain and not altogether favorable influences, the leading operators have succeeded in holding prices up remarkably well.

Pig Lead.—The tone of the market continues fairly strong, considering the fact that stocks in Eastern consumers' hands are apparently below the average. Speculative interest in this quarter is extremely tame; the jobbing trade are conservative buyers also, and, upon the whole, present prices appear to be quite as high as trade conditions would fully warrant.

Spelter.—The volume of business is uncertain, yet believed to be considerable. Some late advices indicate an improvement latterly in the tone of the primal markets, but most accounts go to show that the production is excessive, although low prices seem likely to lead to curtailment of output in some of the least favored sections ere long. Export outlet is narrow, and the chances for profit on shipments between present cost here and selling basis in Europe are extremely vague.

Antimony.—In a jobbing way there has been about the usual business, but dealings otherwise continue on a very moderate scale and prices remain almost stationary.

Tin Plate.—Additional large orders have been placed for ordinary Bessemer Steel Cokes, spring season delivery. In some instances a further advance of 2½¢ per box was paid, making a rise of 5¢ since the beginning of the month. Similar class of Plates has been taken on the spot rather more freely also and holders now ask about 2½¢ advance on former prices for 95 lb and lighter weights. Otherwise business continues moderate and the changes in prices are few and unimportant. No changes in prices have been made in small quantities, and there is no perceptible change in the demand for Plates.

Coal.

The Coal trade in all departments is much deranged on account of the active demand and inadequate supplies. The scarcity of Bituminous Coal since January 1 has never been so marked except when there was a general strike some years ago. In fact, the market is bare, so that many dealers attempt nothing beyond the supply of customers and in some instances are glad to get fuel of any description wherever it can be found. The price may be quoted $3.75, alongside. Anthracite of all kinds is in good supply except the steam sizes, which are difficult to get. Pea and Buckwheat really have no market price, but Pea is fairly quoted at $3.50, alongside and Buckwheat $2.50, alongside. The former has sold as high as $3.75, depending on the supply of the seller and the wants of the buyer. The combine prices hold good for all sizes, with the exceptions noted, but f.o.b. prices are no criterion, so long as prices at the point of delivery are so variable. Bituminous dealers are behind, even on their contracts.

A combination of all the railroad Coal mines in Western Pennsylvania, to be known as the Western Pennsylvania Coal Company, is being organized. It is said that 100 operators and $15,000,000 capital are already in the pool, the purpose of which is to establish uniform prices, curtail expenses and to enter into competition with the Hocking Valley pool. Only Western consumers are interested.

Financial.

The most important event of the week is the decisive defeat in the Senate of a motion to take up the bill to repeal the Sherman silver-purchasing act, a result that at once revives the question of an extra session and suggests a doubt whether anything better would follow. The latest Treasury statements are referred to as showing the urgent need for the suspension of silver purchases. The Government net gold fund is reported at $108,181,713 on January 31, a loss of $13,000,000 during the month, and reducing the surplus to the smallest figure reached since specie resumption in 1879, while gold exports are still in progress. A fact of significance in this connection is the complete falling out of gold receipts for customs duties on the part of New York, something which has never before occurred at this season of the year. Referring to prospects, Treasurer Roberts said: "When the surplus is exhausted the reserve will be drawn upon, as that is what it is there for." One of the largest exporters of gold is reported as saying, if the United States Government would give some positive assurance of preserving a parity between gold and silver, there would be less demand for gold from Europe. The Anti-Option bill having passed the Senate, now goes to the House for concurrence in numerous amendments. If the bill becomes a national law Henry Clews says: "The dealing in options will be superseded by the dealing in storehouse certificates in the same way that gold was dealt in during the war period. We can deal in wheat, corn and cotton on just as large a scale as now done in options by adopting the same method. There will, therefore, be no need of either the cotton or grain exchanges disbanding." Despite the uncertain future, business is surprisingly active for this season of the year, as indicated by the large distribution of products to consumers, the activity of the industries, the volume of bank clearings and the very heavy railway movement, some of the trunk lines being compelled to refuse freight from inability to forward it.

The Stock Exchange market was spasmodically active, the heaviest trading and the wildest fluctuations being in distilling and cattle feeding, the recent sharp decline seeming to have been only a partial check on speculation. Richmond Terminal was bought largely on the news that Messrs. Drexel, Morgan & Co. are likely to take up the reorganization. The activity in the Reading New England group was based upon news of the probable early acquisition of the Old Colony system by the Boston & Maine and Reading party, and also by a well-defined rumor respecting the future of the New England road. The decrease in the surplus bank reserve was hardly noticed. On Monday an advance in exchange had a slightly disturbing effect, until it was stated that the rise did not indicate early shipments of gold, when the movement grew stendier and then stronger, with an advance in St. Paul, in Northern Pacific preferred and in Louisville and Nashville as the feature. Gradually the whole market fell off, and selling became more liberal all around on news that the motion to take up the repeal of the Silver Purchase bill had been defeated in the Senate by 22 yeas to 42 nays and the whole list was carried downward. London houses bought some stock on the decline.

United States bonds were quoted as follows:

U. S. 4½s, 1891, extended	100
U. S. 4s, 1907, registered	113¾
U. S. 4s, 1907, coupon	113¾
U. S. currency 6s	107½

Chicago Report.

Scrap.—The improving outlook has caused a better demand for stock. Dealers quote the following buying prices:

	Per net ton.	Per lb
No. 1 Wrought Scrap	$12.50	13½¢
Machinery Cast	10.00	..
Malleable Cast	8.00	..
Stove Plate (free of burnt)	7.50	....
Burnt Iron and Grate Bars	5.50	....
Sheet Iron and Hoops	4.00	....
Plow Steel and Breaking Stock	8.50	....
No. 2, such as Shovels, Hoes, &c.	4.50	....
Old Boilers—whole (Iron)	8.00	....
" (Iron)—cut in single		....
Sheets and Rings	12 00	....
Old Gas-Pipe and Boiler Tubes	9.00	..
Cast Borings	5.00	....
Turnings	7.00	....
Horseshoes	13.00	....
Copper Bottoms	....	8¢
Copper Clips and Heavy	....	9½¢
Heavy Brass	....	8½¢
Light Brass	....	4 ¢
Pipe Lead	....	3 ¢
Tea Lead	....	2¾¢
Zinc	....	3 ¢
Rubber	....	5¾¢

Anthracite.—Bituminous Coal grows still scarcer and at one time last week a famine seemed impending. More factories were obliged to shut down. Anthracite has consequently been in greater demand and prices are very firm. The moderation of merchants in withstanding the temptation to advance prices is highly creditable to them. Quotations on carloads of 12 net tons are as follows:

	Grate.	Egg, Sto. and Ch.
Chicago, Ill	$5.85	$6.10
Milwaukee, Wis	5.85	6.10
Kansas City, Mo	9.05	9.30
Council Bluffs, Iowa	9.05	9.30
St. Joseph, Mo	9.05	9.30
Leavenworth, Kan	9.05	9.30
Omaha, Neb	9.05	9.30
Burlington, Iowa	7.35	7.60
Des Moines, Iowa	8.80	9.05
Davenport, Iowa	7.15	7.40
Dubuque, Iowa	7.15	7.40
Madison, Wis	7.35	7.60
St. Paul, Minn	8.35	8.60
Lincoln, Neb	9.20	9.45
Sioux City, Iowa	9.05	9.30
Aberdeen, S. Dak	9.10	9.35

Colorado Anthracite.

COLORADO FUEL & IRON COMPANY.

Denver	$8.00
Pueblo	8.00
Colorado Springs	8.00
Leadville	8.00
Cheyenne, Wyo	10.00
All points between Denver and Missouri River	9.35

In response to a resolution of the House calling for information on the subject of the transit of merchandise from one port in the United States to another port in the United States, through Canada in bond, President Harrison sent in a message stating that the law did not contemplate the passing of sealed cars to any place not "a port," and that a policy adapted to the new conditions growing in part out of the construction of the Canadian Pacific Railroad should be declared.

The report to the New York Legislature of the State Board of Mediation and Arbitration argues that arbitration for the settlement of grievances and disputes should be made compulsory upon all corporations.

The Mexican treasury authorities have an arrangement that operates like a trap when deposits are made, and forfeited on account of non compliance with the terms agreed upon. Many thousands of dollars have lately been scooped into the Treasury where concessions have been canceled.

CONDITION OF THE

Hardware Trade.

OUR ADVICES generally indicate a fair movement of business, which, however, to some extent has been interfered with by the severe weather. January orders were certainly up to the average and February has opened well. Prices are without important change, and there are not as yet many indications of increasing strength. In some lines, however, there is a slight reaction from the extremely low prices which have ruled, and there is among the trade a feeling that if the volume of business for the season is as large as anticipated there must be something of an advance on certain lines.

Notes on Prices.

Wire Nails.—The last few weeks have witnessed the placing of many orders for Wire Nails, the trade taking advantage of the low prices ruling. This fact, together with the narrow margin of profit, has had the effect of giving the market a slightly better tone, and manufacturers are unwilling to quote prices which they made a few weeks ago. Small lots from store in New York are quoted at $1.75.

At a meeting of Wire Nail manufacturers, held in Chicago, February 3, the following resolution was offered and unanimously adopted:

Whereas, it has become the prevailing custom for manufacturers of Wire Nails to make sales and contracts so worded, and with such condition in favor of the buyer, that they are simply options, enabling the buyer to control the product of the manufacturer. Therefore be it

Resolved, That on and after this date no sales or contracts shall be made except for immediate specifications, or for a definite tonnage to be taken within a definite time, and subject to no guarantee nor readjustment of any sort, thus holding the buyer to his part of the agreement as well as the manufacturer:

Resolved, That this shall be published as the uniform action of all manufacturers of Wire Nails.

The following are the names of the manufacturers who unite in taking the above action:

HP Nail Company, Cleveland, Ohio.
Braeckes Wire Nail Company, Cleveland, Ohio.
Oliver & Roberts Wire Company, Pittsburgh, Pa.
Consolidated Steel & Wire Company, Chicago, Ill.
Salem Wire Nail Company, Salem, Ohio.
Newcastle Wire Nail Company, Newcastle, Pa.
A. R. Whitney & Co., New York, N. Y
New Philadelphia Wire Nail Company, New Philadelphia, Ohio.
California Wire Works, San Francisco
American Wire Nail Company, Anderson, Ind.
Arrow Company, Anderson, Ind.

Action was also taken at the meeting in regard to price. As to stocks on hand and contracts which manufacturers now have, as far as could be ascertained at this meeting, there were nearly 50,000 kegs more Nails sold than on hand. In the aggregate there were about 225,000 kegs of Nails in stocks and 275,000 kegs on contracts.

Advices from Chicago.—Manufacturers report a fair movement in Wire Nails, with increasing inquiries. They are gradually absorbing a great deal of the business which has hitherto been controlled by jobbers, and consequently do a larger proportion of the trade in single carloads and in mixed carloads with Barbed Wire. Prices were advanced at a meeting of the trade here on the 3d inst., and quotations are now made at $1.57½, Chicago, on all factory lots. The manufacturers not present at the meeting have since sent in their ideas of the action taken, the only criticism made being the very slight advance, as a higher price was wanted. This advance, however, stands a better chance of being maintained than if it was higher. Jobbers quote $1.60 to $1.65 from stock.

Cut Nails.—The market for Cut Nails has been somewhat affected by the announcement of the new price-list which was published in our last issue and which is given in a convenient form for reference in another column, inasmuch as it introduces a certain element of uncertainty owing to the fact that it is adopted by some manufacturers and not as yet by all, while the trade are unfamiliar with it and have scarcely had opportunity to consider it in all its bearings. The Eastern manufacturers with substantial unanimity have adopted it and are making it the basis for quotations. There has been, however, little business done on the new basis. The price from store in New York is $1 off list, but there is as yet no definite quotation as to the price for lots at mill, manufacturers being conservative in regard to making a price. The Western mills have not adopted the new list nearly as generally as the Eastern mills and are waiting to see how the matter is regarded by the trade. There is, however, a disposition to regard the new list favorably, and approval is expressed of the object sought to be gained—namely, the doing away with the system of averages. Expressions from some of the large dealers are in the main satisfactory to the new card, but some would prefer a card similar to the old one on which a base price should be quoted on 10d or 60d instead of having a list with a discount, as is now proposed. In another column reference is made to the views of the trade on this subject, and a comparison is also made as to the price of Nails on the old and new basis respectively.

Advices from Chicago.—The new Cut Nail price-list has not yet been used in this market as a basis of quotations so far as the writer is able to learn. Manufacturers are not believed to be adverse to it, but are waiting to ascertain how it is being accepted further East. They continue to quote on the basis of $1.60 for 30-cent average and report an unexpectedly good trade considering the inclemency of the weather, outdoor work having been almost suspended since the third week of December. Jobbers quote $1.65 to $1.70 from stock.

Barb Wire.—The Barb Wire Market is in a somewhat better condition, and manufacturers have withdrawn their extreme quotations. Prices are represented by the quotation of $2.40 to $2.45 for carload lots of Four Point Galvanized. There is also an improvement in the demand and the volume of business is referred to as good for this time of the year. Small lots from store in New York are held at $3.10

for Four Point Galvanized, or $3 for carload lots.

Advices from Chicago.— The largest manufacturers are understood to have agreed that carload prices of Painted shall not be under $2.20, Chicago. Smaller concerns have agreed to support this price, but desired the rate made $2.25. Orders continue to improve from day to day. A shortage of Rods is also beginning to be felt by the Wire trade, owing to the stoppage of two or more mills. These circumstances favor the attempt to get an advance. Jobbers here have changed their standard of quoting Barb Wire and take Galvanized, which constitutes about three-fourths of the trade. They quote it from stock at $2.60 @ $2.65 with 40 cents off for Painted.

Lawn Mowers.—The trade in Lawn Mowers continues active and it is evident that large quantities will be sold during the present year. Prices, however, continue low and irregular and have a wide range, according to the standing and quality of the different machines. The condition of business in this line is reflected in advices received from manufacturers, one of whom writes as follows:

Altogether the prospects for the coming season are very promising. Up to the present time the demand is far in excess of last year's business, and with weather favorable to this trade the business in these goods for the year will be very large.

Another manufacturer, allnding to the very general demand for cheap Mowers, writes:

The large volume of the trade on Lawn Mowers is supplied by the low-grade cheap Mowers, what we term "toy machines," but there is a substantial demand for first-class Lawn Mowers, particularly for use in parks, cemeteries and large lawns, and also from other customers who want the best Mower in the market.

Referring to the advantages of handling good Mowers and the demoralization in prices of cheap grades, we have the following from another manufacturer:

A first-class, high-grade Mower insures a feeling of security among the trade that handle it. The prices on all grades of Mowers throughout the country are being reduced year by year until little is left for the manufacturer. There will be a survival of the fittest some day.

An intimation that the manufacturers are responsible for this condition of things and a suggestion that more conservative action on their part would be advantageous are given in the following letter:

The greatest trouble with the Lawn Mower trade now appears to be the prices at which so many factories are selling. In fact, it looks to us as though the price of Lawn Mowers had pretty much gone to pieces. This strikes us as being very foolish. All the factories might just as well make a fair profit on them as to sell them without profit, and we should be glad if you were able to encourage the various Lawn Mower builders to make the prices fair, so that we can all make a little money, instead of so many selling without any profit, and compelling us all to do the same thing. This is unnatural, and should be changed.

Axes.—In mentio ning the prices of the Axes put on the market by the Standard Axe & Tool Works, Ridgway, Pa., in our issue January 21, the price of their Standard Double Bit Axe was erroneously given as $8.50 per dozen. The trade will please note that the correct price on this Axe is $10.50.

Indurated Fiberware.—As we have already announced, the catalogue of Indurated Fiberware, January 25, 1893, for the sale of which Cordley & Hayes, 173 and 175 Duane street, New York, are sole agents, gives reduced list prices on many of their goods. The revised list is given below, and is subject to a discount of 25 per cent.:

	Per dozen.
Star Pails, 12-quart	$4.20
Buggy Pails, 6-quart	3.60
Ladies or Weaver's Pail, 6-quart	3.60
Deep Fire Pail, 10 quart	4.80
Deck or Masons' Pail, 12-quart	4.80
Railway or Factory Pail, 14-quart	5.40
Milk or Dairy Pail, 14-quart	5.40
Round Bottom Fire Pail, 12-quart	5.40
Stable Pails, 14-quart	$6.00
" " 16 "	7.20
" " 18 "	8.40
" " 20 "	9.00
Pail Covers, 2 dozen in crate	3.00
Wash Tubs, No. 0, 13 inches deep, 23½ inches diameter	$21.00
Wash Tubs, No. 1, 12 inches deep, 20½ inches diameter	18.00
Wash Tubs, No. 2, 10½ inches deep, 19 inches diameter	16.00
Wash Tubs, No. 3, 9½ inches deep, 18 inches diameter	14.00
	Per nest.
Nested, No. 0 Nest, one each 0, 1, 2, 3 Tubs	$5.75
Nested, No. 1 Nest, one each 1, 2, 3 Tubs.	4.00
" " 2 " " 0, 1, 2 "	4.60
Nested, No. 6 Nest, one each 0, 1, 2 Tubs, 1, 2, 3, 4 Keelers	6.65
Nested, No. 8 Nest, one each 0, 1, 2, 3 Tubs, 1, 2, 3, 4 Keelers	8.30
	Per doz
Sitz Tubs, No. 0, 23½ inches diameter.	$24.00
" " 1, 20½ " "	21.00
" " 2, 19 " "	18.00
¼ dozen in crate, or nested one of each size.

Quarter dozen in crate or nested.	
Pickle Tubs, for grocers' use. One size, 2 gallons	$3.60

Glass.—The National Window Glass Company is an assured fact, arrangements having been completed and the organization formed last week at Chicago. The officers of the new concern, as selected in Milwaukee and incorporated under the laws of Wisconsin, are J. A. Chambers, Pittsburgh, president; T. F. Hart, Muncie, Ind., vice-president; Geo. F. Kimball, Chicago, treasurer; F. H. Fox, Chicago, secretary. Among the manufacturers on the Board of Directors are T. F. Hart, Muncie, Ind.; William Loeffler, Pittsburgh; N. T. Depauw, New Albany; H. Sellers McKee, Pittsburgh; J. A. Chambers, Pittsburgh; T. D. Cattlin, Ottawa, Ill.; A. L. Conger, Akron, O. The jobbers selected as directors are G. F. Kimball, M. Campbell, Kansas City; Charles Baumbach, Milwaukee; Albert Drey, St. Louis; E. W. Palmer, Cleveland, and William Reid, Detroit.

Fully 93 per cent. of the manufacturers and jobbers of American Window Glass are included in the company, and the capital represented exceeds $50,000,000.

The company are incorporated under the laws of Wisconsin with a capital of $200,000, which has been subscribed to by manufacturers of Pittsburgh, Wheeling, Ohio, Indiana and other Western States, also by jobbers in different parts of the country. A forfeiture clause has been inserted in this new agreement by which each manufacturer who joins the company must post a forfeit of $100 for each pot in his factory. Jobbers were called upon to subscribe in proportion to their stock, the money deposited, otherwise capital stock subscribed, being held as forfeit. It is understood that over $200,000 in forfeits has been posted by members of the company. This money has been paid to the treasurer of the company, and it is agreed that the forfeits shall lapse into the general treasury whenever a manufacturer or jobber is found cutting prices. It is the purpose of the company to control and maintain prices, and the company will fix prices and negotiate terms with organized labor; but the management of plants and sale of Glass will be left to the factory owners. The company will not have power to order any plant or plants to cease operations at any time that the condition of the market might seem to warrant closing down. New prices were adopted at the meeting, to take effect immediately, applying to the present list, as follows: Two thousand boxes in one order and at one shipment, 80 and 10 and 10 per cent. discount; carloads of 400 boxes, 80 and 15 per cent. discount; 100 boxes or over, 80 and 10 per cent. discount; less than 100 boxes, 80 and 5 per cent. discount. A committee was appointed at the same meeting to revise the Glass list. The volume of business in American Window Glass shows no increase since our last report. French Window Glass is also quiet and price weak. It is reported that imported Glass can be bought at from 80 per cent. discount to 80 and 5 per cent. discount. American Plate Glass is unchanged in price and is in limited demand. Present quotations are as follows:

American Window Glass, 2000 boxes at one time, 80 and 10 and 10 per cent. discount; carloads, 400 boxes, 80 and 15 per cent. discount; 100 boxes or over 80 and 10 per cent. discount; less than 100 boxes, 80 and 5 per cent. discount. French Window Glass, 75 and 10 and 5 per cent. discount. American Plate ranges in price from 60 and 2½ per cent. discount to 60 and 5. Imported Plate Glass, 60 per cent. discount to 60 and 10 and 5 per cent. discount.

THE ANSONIA BRASS & COPPER COMPANY, New York, have issued a general price-list of Brass and Copper, Tobin Bronze, &c., for 1893. While comparatively few changes have been made in the lists, the catalogue is larger than their former editions, and contains much valuable matter in tabulated form of weights, sizes, &c. The company have made extensive additions to their mills during the past year, including new and improved machinery, which will enable them to execute orders promptly for special goods They will also carry larger assortments of sizes in stock than heretofore.

The Price-List on Cut Nails.

From the Merchant's Point of View.

THE MATTER of determining the advantage and disadvantage of the price-list of Cut Nails is a somewhat complicated one, and merchants are in many cases unwilling to express themselves on the question. A leading jobbing house in the East refer to the list as a good thing for the manufacturers and are disposed to regard it favorably, although they feel it will lessen the jobbers' profit, but as it saves the annoyance of obtaining a memorandum of sizes before making quotations they are, on the whole, pleased to have it adopted. A jobbing house in Western New York say:

While we have looked over the new price-list, we can hardly as yet form a correct opinion as to how it will act. We believe it will take some time to educate our trade to its use, but we are inclined to believe that after we become familiar with it it will prove entirely satisfactory.

One of the leading jobbing houses of the country state that while they may have a positive opinion on the subject after they have had an opportunity to test the price-list practically, they can at present only speak generally. They regard a change in the card as a good thing, because the Cut-Nail trade has for a long time been in a rut, and almost anything in the way of a change is preferable to the existing condition of things, even if the benefits derived should eventually prove to be only slight.

A prominent Western jobbing house criticise the classification adopted, which puts all heavy Nails from 10d to 60d at the same price. This is an arrangement which they think will be found in practice to work badly. At the same time they are strongly in favor of the adoption of a new price-list, which will do away with the very objectionable practice of quoting prices based on averages.

A leading Chicago jobbing concern declare that they are not strongly opposed to the old card, and reserve an opinion as to the new one until they find that it will give the jobber some advantages which he does not now possess. They state that they have not experienced any special annoyance from the practice of selling Cut Nails on averages.

Another prominent Chicago jobbing

10 cents extra for each half keg.

house advise us that they do not favor the new price-list, because it attempts to establish a special price on each size of Nails. This, they think, will result in buyers splitting up their orders among sellers whenever there is close competition for business and parties are asked to submit prices. In order to conduct business under the new price-list, it will be necessary for buyers to submit their specifications in advance so that prices may be made intelligently. Nevertheless, they hope the manufacturers may be able to do something to put the Nail trade in better condition than has so long prevailed.

In order to illustrate the bearing of the new price-list on the price of Nails we give below the cost of an assorted carload on the old and the new basis. It is obvious that the price will depend on the discount taken from the list, and it is as yet undetermined what this discount will be. In the calculation which follows the price is supposed to be discount $1.25 on a carload lot, f.o.b., but some manufacturers express the opinion that the discount on such lots will be $1.20. The following is the cost of an assortment of 250 kegs at $1.40 basis, f.o.b. mill, upon a 35-cent average:

3d Fine,	10 kegs....	$1 50 extra		$15.00
4d Flat,	5 "	.60		3.00
4d Common,	5 "	.60		3.00
5d "	5 "	.60		3.00
6d "	25 "	.40		10.00
8d "	60 "	.25		15.00
10d "	70 "	.20		14.00
12d "	30 "	.15		4.50
20d "	10 "	.15		1.50
40d "	5 "	.05		.25
8d Finishing,	10 "	1.00		10.00
10d "	10 "	.85		8.50
60d Common,	5 "	....		....
	250 "	at 1.40 basis		350.00
				$437.75

The following is the cost of the same assortment purchased at a discount of $1.25 from list, January 31, 1893, f.o.b., mill:

3d Fine,	10 kegs.....	$4.00		$40.00
4d Flat,	5 "	3.35		16.75
4d Common,	5 "	3 35		16.75
5d "	5 "	3.35		16.75
6d "	25 "	3.20		80.00
8d "	60 "	3.10		186.00
10d "	70 "	3.00		210.00
12d "	30 "	3.00		90.00
20d "	10 "	3.00		30.00
40d "	5 "	3.00		15.00
8d Finishing,	10 "	3.20		32.00
10d "	10 "	3.10		31.00
60d Common,	5 "	3.00		15.00
	250			$779.25
250 kegs at $1.25 per keg.				312.50
				$466.75

It will thus be seen that on the assortment named above, which is perhaps a fairly representative one, the Nails under the new list at the discount named cost $29 more than on the former basis.

The matter is regarded from the retailer's standpoint in the following letter:

In looking over the national price-list of Cut Nails from a retailer's point of view we are pleased with the idea of buying Nails at a discount—or, more properly, at a rebate—as this plan is right in line with buying other Hardware, so it will not take long for us to become educated to the new price-list. It will also be convenient in selling a bill of Nails, as we can hand the price-list to a customer and say, "We will sell you all the Nails you want at 25 cents off of the prices." It does away, also, with the trouble of figuring averages, which we never could remember about from the time we bought one carload until we needed another. Then, too, at the same discount each kind of Nail will cost us the same, whether bought now or in six months. With this price-list there will be no temptation to purchase a lot of fancy Nails, which locks up capital, to secure a high average and low prices on a carload. So much for the advantages. The manufacturers claim that the price-list is honestly figured on the actual cost of manufacturing each size, and that the arrrangement has proved such that averages cannot be figured and make money. We are not prepared to say in so short a time how the new prices are going to work with our customers. The 8d and 10d Nails, which constitute two-thirds of the Nails sold, are higher than before; and whether the fact that fancy Nails are lower will console them for paying more for the larger quantity of Nails used or not, remains to be seen. Then those of us who have a quantity of fancy sizes, enough to last us for a year or two, have to pay more for the common Nails to work the fancy sizes off. As far as we have compared the old card and the new price-list we find that on the new basis prices will be lower on a former low average, and higher on a former high average. We think on the whole that a change is desirable, and trust that this may be found practical.

Trade Notes.

F. E. MYERS, of the firm of F. E. Myers & Bro., Ashland, O., manufacturers of the Myers Pumps and Hay tools, left Tuesday on a trip that will be full of interest and enjoyment. He goes on an excursion of business men to Mexico and Cuba, and will remain a month. The excursion was originated by the Australasian Publishing Company of New York. Mr. Myers will join the excursion at Columbus, O., go with the party to St. Louis, from there to Mexico, spend a week or more there, then visit Cuba and return by way of ocean steamer to New York. Mr. Myers will combine business with pleasure.

THE FIRM OF MELDRUM & JONES, Room 407 Commerce Building, Louisville, Ky., was recently established for the purpose of acting as sales and purchasing agents in the Iron, Metal and Hardware lines. The young men composing this firm have been for the past nine years in the employ of one of the best known Hardware and Iron houses in Louisville, and they have an extensive acquaintance among dealers in their line in Louisville and the South. They would like to open up correspondence with dealers in the lines they represent who are desirous of representation in that section.

IRON CLAD MFG. COMPANY, 22 and 24 Cliff street, New York, in a circular to the trade, under date of February 3, 1893, state that the Habermann Mfg. Company are offering for sale a variety of Gray Ware, which the Iron Clad Mfg. Company are advised by their counsel is an infringement of patents owned by them, and that they shall immediately commence proceedings to protect their interests and enforce their rights by due process of law.

WRIGHT & COLTON WIRE CLOTH COMPANY, Worcester, Mass., have in operation, in addition to their wire weaving business, a plant for the manufacture of Wire, which they are prepared to furnish, including Annealed and Bright Market, Annealed Stone or Weaving Wire, Tinned, Stone, Broom and Matress Wire; also Steel Spring and Coppered Wire. A specialty is made of Market and Stone Wire, also of Straightened and Cut Wire. Their Hard Steel Galvanized Wire Poultry Netting is meeting with large demand, and it is expected that their mill will have to be run nights very soon in order to furnish the requisite amount of Wire for Poultry Netting and Wire Cloth.

Englishmen have cleared 18,000 acres of land for a sugar plantation in the island of Lambasoe, of the Fiji group.

THE TIN SHOP.

Triangulation in Pattern Cutting.—XX.

By Triangle.

(*Conclusion.*)

PATTERN FOR THE FRUSTUM OF A HEXAGONAL PYRAMID.

In Fig. 150 is shown the finished article which the pattern is for. In Fig. 151, let E F G H represent the elevation, M N is drawn the corresponding plan. By extending the side lines of the two elevations until they meet we have the apex of the pyramid of which either elevation is the frustum. As shown by Y and Y″, which are connected by the broken line Y Y″, the two pyramids are of the same hight. The pattern for one of the sides could be obtained from the plan and elevation as follows: Place the T-square at right angles to any side of the plan, as R Q, and drop lines indefinitely from the points necting *r x w f* the pattern for one of the faces would be the result. The pattern can be proved to be right by erecting the perpendicular E F, which should be of the same length as E F of elevation A, which gives the slant hight of one of the sides. If the pattern for the entire article is required, a convenient method for obtaining it is shown in Fig. 152. With Z as center, and Y″ M′ as radius, describe an arc indefinitely, as *m m′*, and with the same center, another arc, with Y″ S″ as

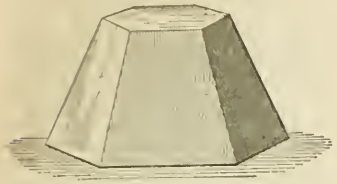

Fig. 150.—*View of the Finished Article.*

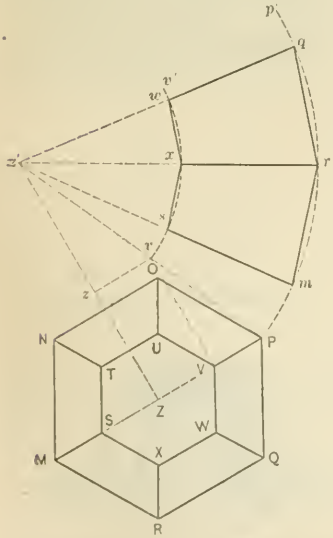

Fig. 153.—*Section Drawn on Miter Line.*

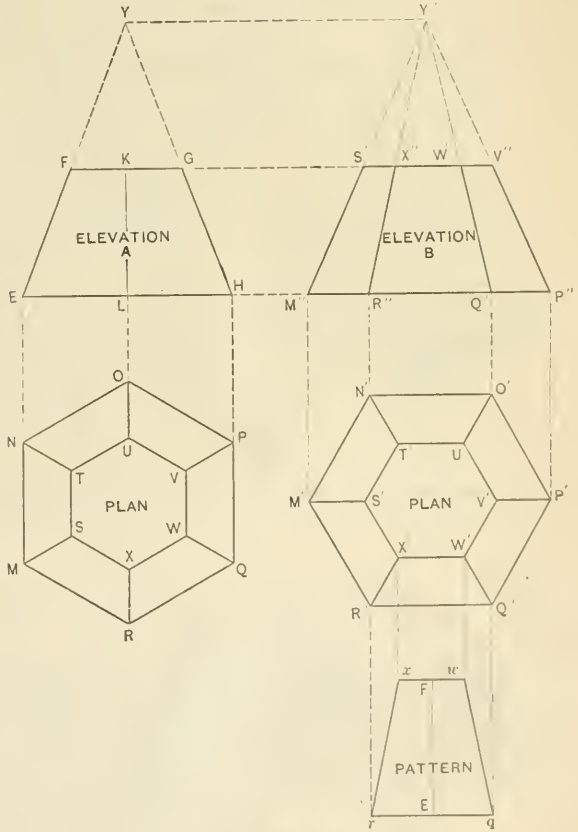

Fig. 151.—*Plan, Elevation and Pattern.*

PATTERN OF FRUSTUM OF HEXAGONAL PYRAMID.

O P Q R the plan of base, and S T U V W the plan of top. In elevation A, the figure is so placed that one of the angles, as L K, is to the front, while E F gives the slant hight of one of the sides. By drawing the elevation as shown in elevation B, we have the length of one of the angles shown by M″ S″, or the distance as measured on the finished article from M′ in the base to S′ in the top. Under elevation B in plan, as from R′ Q′ and X′ W′. With the T square placed parallel with R′ Q′, at a convenient point, draw the line *r q*, cutting the lines drawn from R′ Q′, as shown. As M″ S″ of elevation B gives the length of one of the angles, with *r* and *q* as centers, and M″ S″ as radius, describe arcs cutting the lines dropped from X′ W′, and connect the points by a line drawn through them, as shown by *x w*. By con- radius, as shown by *s s* of pattern. Through one extremity of each, to the center, draw a straight line, as shown by M S Z. Set off on the arc *m m′* spaces equal to the sides of the plan of the base of the article and connect the points with chords. Thus make M N of the pattern equal to M′ N′ of the plan, and so on. Also from these points in the arc draw lines to the center, cutting the arc *s s′*, as

shown. Connect the points thus obtained in this arc by chords, as shown by S T, T U, &c. Then M S S° M° will be the required pattern. As previously stated, M″ S″ of elevation B gives the length of one of the corners, and E F of elevation B the slant hight of the sides. By taking drawn from the center of the plan through one of the angles of the figure, as shown by Z P. Erect the perpendicular Z z, in length equal to the straight hight of the article (shown by L K in elevation A), and at V erect another perpendicular, V v, of the same length. Draw z v and v P. We z' as center, and z' P as radius, describe an arc indefinitely, as shown by P p, and with the same center, and z' v as radius, another arc, shown by v v'. The pattern would then be completed as in the previous example.

In Fig. 155 is shown a duplicate of the plan, from which by the aid of triangles we will proceed to describe the pattern by triangulation. In practice, the half plan or the plan of one of the sides, as R X W Q, would be all that would be necessary for describing the pattern by the aid of triangles. For the triangles proceed as follows: At right angles to R X draw X x', in length equal to the straight hight of the article, and connect R x', which gives the distance from R in the base to X in the top. We will require the distance from X in the top to Q in the base, which we procure by drawing the diagonal X Q and erecting the perpendicular X x, equal to the straight hight of article, and connecting Q x. A diagram of triangles similar to those drawn on plan is shown in Fig. 154.

For the pattern shown in Fig. 156 proceed as follows: Draw the line R″ x'', in length equal to the hypotenuse R′ x'. With R″ of pattern as center, and R Q of plan as radius, describe an arc (Q″), which intersect with one struck from x'' of pattern as center, and the hypotenuse Q x as radius, thus establishing the point Q″ of pattern. With x'' of pattern as center, and X W of plan as radius, describe another arc (w''), which intersect with one struck from Q″ as center, and R x' of triangle as radius, thus establishing the point w'' of pattern. Lines drawn through the points obtained, as shown by R″ x'' w'' Q″, will form the pattern for the face of article shown on plan by R X W Q. As the other faces of the article are alike, it is quite evident their patterns can be obtained in a similar manner, as shown by the pattern contained in O″ u'' $u°$ O°.

As has been previously explained, models can be made of cardboard by pricking

PATTERN FOR FRUSTUM OF A HEXAGONAL PYRAMID.

Y E as radius, and striking an arc from the center Z, as show by e e', we see that the arc touches the chords previously drawn. The same result is obtained by striking the arc f f', with Y F as radius.

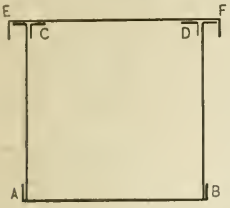
Another method for obtaining the pattern and without the elevation is shown in Fig. 153. The first step would be to construct a diagonal section, the base of which shall correspond to one of the lines have now produced a section of the article as it would appear if cut on the line Z P. Produce Z z and P v until they intersect at z'. Then z is the apex and P z' the side of a right cone, the plan of which, if drawn, would circumscribe the base of the frustum. P v z' is the same as P″ Y″ Y″ in elevation B.

To describe the pattern from the plan and diagonal section thus obtained: With through the points in pattern, drawing the required lines, cutting out the cardboard pattern, and after cutting half way through the cardboard on bending lines, it can be formed as desired. The joining can be done by means of a hot wire and pieces of sealing wax. In Fig. 157 is shown the pattern for the model in Fig. 158. To draw the pattern: Make E F G H equal to elevation B, below which draw

the half plan, as shown. Above F G draw the half plan of top. The pattern is to be bent at right angles on F G E H. Three triangles similar to V *v* P in Fig. 153 can be cut out and placed with their bases on the base lines M *s'*, R *x'*, P *v'* of plan, as shown in Fig. 158. The dotted lines S R and X Q in model, which correspond with Q *x* in Fig. 155, can be represented by means of colored thread.

Construction of Incubator Tank.

From J. C., *Factoryville, Pa.*—I have a "square" incubator tank to make that is to be 3 feet long, 15 inches wide and 15 inches high. There is to be no opening in the tank except a small one for a faucet.



Construction of Incubator Tank.—Fig. 1.—First Method of Forming.

I would like to be informed of some method for keeping the sides of tank in position while putting on the top after the bottom is on. While the bottom can be double seamed, a stake could not be held inside for securing the top in a similar manner. If the top is paned on, the sides are liable to spring in, especially while being soldered.

Answer—There are a number of methods by which the top can be joined to the body of tank after the bottom has been

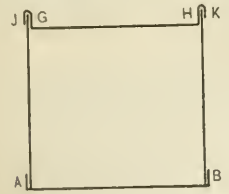


Fig. 2.—Second Method of Forming.

put on. In Fig. 1, which is a sectional view of tank, it will be supposed that the bottom has been joined to body by double seaming or any other convenient method, as indicated at A B. Suitable edges are

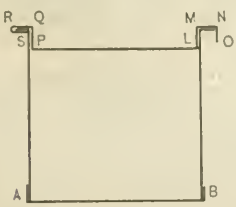

Fig 3.—Third Method of Forming.

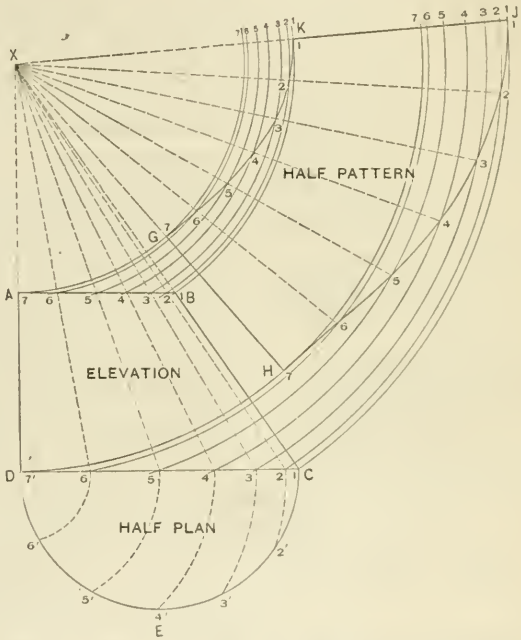
to be turned on the tank and also on the top, as indicated by E and F. Cleats can be fastened to the top as shown by C and D, which will hold the sides in position while the edges E F are being turned over. The soldering could then be done with little difficulty. By this method the edges, as E and F, would project beyond the body of tank, which might not be desired.

In Fig. 2 the method shown is such as is used in closing the ends of furnace square pipes. In this figure the bottom is supposed to be joined to the body by any convenient means. The top is formed as indicated by J G H K, and the edges, as represented by J and K, can be closed against the sides of tank so the soldering can be done conveniently.

In Fig. 3 is shown a method by which the top can be double seamed after the bottom is on. The usual edges are to be turned on the body, and the top formed as shown by L M N O. It is then to be placed in position on the tank and the edges similar to N O turned over as indicated by Q R S. After this operation has been performed the edges which are as shown by Q R S can be turned over against the body of tank, the result being similar to double seaming.

Pattern of Irregular Flaring Article.

From J. S., *St. Louis, Mo.*—Can some of the readers of *The Metal Worker* inform me, through its columns, regarding a short or easy way for obtaining the pattern of an irregular flaring article having one side vertical. The way I lay out the pattern takes too much time when one is in a hurry, hence a short or easy rule would be found very convenient at times. The method I use for obtaining the pattern is as follows: Let A B C D represent the elevation, and D E C the half plan of base. Produce A D and B C to X, which is the apex of cone of which A B C D is a frustum. Divide the half plan of base into any convenient number of equal parts with D as center. From the points in D E C describe arcs cutting D C, and from the points thus obtained in D C carry lines to the apex X. From the apex X draw the line X J. With X as center and from the points in D C strike arcs cutting X J. In a similar manner, with X as center and from the points in A B, strike arcs cutting X J. Set the compasses to the space D 6' of plan, and, starting from J, step from arc to arc, thus laying out the stretchout of D E C. From the points thus obtained draw lines to X cutting the arcs struck from A B. Draw lines free hand through the points in H J and G K, thus completing the half pattern.



Pattern of Irregular Flaring Article.

Note.—The pattern of article is usually obtained by the method shown by our correspondent, or by triangulation. If any of our readers have a short or easy way for securing the same result, will they comply with our correspondent's request and send the same for publication in *The Metal Worker?*

The construction of the first Hurst gun, with its "reinforced multicharge cartridge," was commenced in Washington last week, $50,000 having been appropriated by Congress for this purpose. The sum of $150,000 was paid for the right to manufacture.

Advices from Buenos Ayres show that, besides revolutionary disturbances within Argentina, relations between that country and Chili are strained to a dangerous point. Complications which arose during the struggle ending in Balmaceda's defeat are still a constant source of irritation.

WORLD'S FAIR NOTES.

Cold Weather Retards Progress.

The big Manufactures Building is a busy place these days. Between 200 and 300 carpenters are at work erecting the booths. It is somewhat odd that foreign exhibitors are about the first on the ground. Some 60 carpenters more are engaged in constructing the additions to the galleries across the pavilions. The floor space in the building is being increased in this way by nearly two acres.

The booths of the great European powers are really large buildings. In any other structure on the grounds they would look out of proportion, but under that great arch they are not over large. The great clock tower is up to the second story. The French Building is boarded up on the inside. The booth of Doulton & Co., the English potters, is going ahead rapidly. The skeleton frame was shipped from England, but the rest is being made by Chicago firms. Sage & Co., the London cabinet makers, have another booth near by nicely started. It was shipped ready to be put together. Forty carpenters are employed on the Tiffany Building, and five Japanese workmen have their structure so far along that it can be said to be a rival in tastiness to any other which may be erected hereafter. All these are under the main arch. New South Wales is building its booth in the west pavilion gallery. At times the sounds of the hammers become merged in one grand roar.

The guards say that during the cold spell it was colder in the building than out of doors. By March 1 the vast space will be well broken and a good idea of the way the Manufactures Building will look can be obtained.

Among the State buildings the cold weather was much more disastrous to construction than elsewhere on the grounds. In the great California Building the force was at one time reduced to three lathers. A solitary painter on Wednesday was trying to cover the wide expanse of the Michigan Building's exterior. He was the sole survivor of a large gang, which had dropped off one by one. Two carpenters were engaged on the Indiana Building. They were cold, extremely cold. Work was entirely suspended on the Washington State Building. A few men were engaged in finishing work at the other State buildings.

After a brave endeavor the contractors for the Illinois Building completed that structure and withdrew their last workmen Wednesday. The State Board examined the structure and probably will accept it. The cold added greatly to the cost of the interior decorations.

Work has not stopped for a day all winter on the Live Stock Pavilion. It was all outdoor work, and the frozen ears, noses, fingers and toes if collected would make a fine anatomical museum.

After a heroic struggle with the cold the construction gang on the electric elevated road surrendered a fortnight ago. It was hoped that the road could be placed in running order by April 1 in order to reap a good revenue from the large fair population of that month, but the delay will prevent the operation of the road until nearly the time for opening the fair. The contractors will put every man available on its construction at the earliest date.

The carpenters kept things moving at the railway station until a few days ago. Finally they called off from the uncqual contest until frozen fingers were not so common.

The greatest center of attraction at this time is undoubtedly Machinery Hall. There one hears the greatest amount of noise, finds the most activity, and sees by far the largest number of laborers at work. Every day there are 350 masons, shovelers, dirt wheelers, and all-around handy men employed on the construction of foundations for heavy machinery that is to be used in the power plant of the great exposition. The scene is both interesting and exciting. Inquiry among some of the foremen and superintendents elicited the information that while this particular department is well advanced there is yet sufficient work before them to keep large gangs going night and day in order to get out of the way of other forces coming on soon to place the machinery and put it together.

Taking into consideration the fact that nothing has ever been attempted in the way of a plan for furnishing steam and compressed air power that can be compared to this display, and only 80 days still remain in which to complete it, great activity is an absolute necessity. The plant covers a space 1100 feet in length by about 150 feet in width, exclusive of the space taken up by the boilers in an annex to the main building. The ground dimension of that entire area is being excavated to a depth of 10 feet below the floor surface and filled almost solidly with stone and brick masonry on which the engines will be placed and bolted down.

Topographical Map of Illinois.

An accurate topographical map of Illinois, made under the direction of the State World's Fair Board, is almost ready to be sent to the Illinois Building at Jackson Park. A prominent place in the building has been reserved for it, because it is believed to be the only map of the State in existence that is anywhere near correct. C. W. Rolfe, who collected the data used in making the map, says that on the best map of Illinois ever published 1382 important corrections have been made. These corrections refer chiefly to the location of railroad stations, the length and course of streams, the location of lakes and their number, the position of railroad lines and the boundaries of counties and the State line. Of course some of the corrections would not be considered important by many people, while the importance of other changes would be recognized at once. One town was found 18 miles from the place the maps located it and 12 streams were discovered to be running in directions exactly opposite the course indicated on standard maps; 193 towns were found to be from a quarter of a mile to a mile out of the way and 43 were from 3 to 7 miles from the places fixed on regular maps for them.
